

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

Automobile Dealer and Repairer

for T. P. & Mech.
860973

A JOURNAL OF PRACTICAL MOTORING

THE MOTOR VEHICLE PUBLISHING CO. 71-73 Murray Street—New York

Vol. 25, No. 1 NEW YORK, MARCH, 1918 Monthly, $1.00 per year Single Copy 10 Cents

JOHNSON'S RADIATOR CEMENT

THE easiest and quickest way of repairing leaks in radiators, pumps, water jackets, hose connections, etc., is to use Johnson's Radiator Cement.

No mechanical experience is required—all you have to do is remove the cap and pour the liquid into the radiator. This will stop the leak instantly without laying up the car.

Quick—Efficient—Harmless

Johnson's Radiator Cement blends perfectly with the water until it reaches the leaks—just as soon as it comes in contact with the air it forms a hard, tough, pressure-resisting substance which is insoluble in water and consequently makes a permanent seal.

Johnson's Radiator Cement contains nothing which can coat or clog the cooling system. It will seal leaks in from two to ten minutes.

Quarts $1.75 Pints $1.00 Half-pints 65c

If your dealer cannot supply you, send us $1.00 and we will forward you a pint all charges prepaid.

Write for our folder on *"Keeping Your Car Young"*—it's free.

ATTENTION

To Dealers in and Users of Brake Lining for Automobiles and Belting

IN the case of The Scandinavia Belting Company, Plaintiff, against the Asbestos & Rubber Works of America, Inc., of New York City, Defendant, the District Court of the United States for the Southern District of New York has recently entered an injunction in our favor enjoining the Defendant, the Asbestos & Rubber Works of America, Inc., from selling or offering for sale belting or brake lining, not of Plaintiff's manufacture, under the names or designations Scandinavian Woven Lining, Ford Scandinavian Woven Lining, Ford Scandinavian Brake Lining, Scandinavian Weave, Scandinavian Type, Scandinavian and the abbreviated form of the word Scandinavian, to-wit, Scand., or under any word or words of like import.

We take this opportunity to again warn the public from buying or selling any belting or brake lining not of our production under any of the foregoing names.

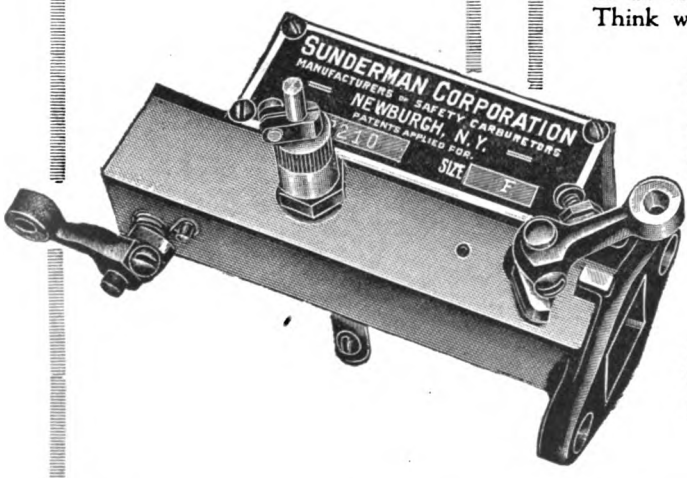
SUNDERMAN
Vacuum Carburetor

$6



F. O. B.
Newburgh

$8 and $10 for other than FORD or METZ

Help Your Customers to Save

That's your duty, Mr. Dealer. Every Car owner wants to save – you must show them how. The SUNDERMAN CARBURETOR will save for them without sacrificing anything.

Start NOW

Install a Sunderman When You Overhaul Your Car

With the first breath of the spring breeze every owner begins to figure on putting his car in good shape for the new season.

By all means do so this year, Mr. Motorist. New cars will be scarcer than last year and you'll have to do more yourself with the old car to make it run sweetly.

A Sunderman Carburetor Will Do Wonders for You

When you scrape the carbon out of your cylinders, grind the valves and put in new piston rings, **finish the job—install a Sunderman Carburetor.**

Then you will get the final answer to complete motor enjoyment with absolute economy.

More Power at a Lower Cost— More Speed on Less Gasoline

The Sunderman Carburetor works on the soundest scientific principle — that of breaking up the gasoline globules into infinitely minute particles, thus releasing the power that is bound up in coarser mixtures and lost in the combustion chamber.

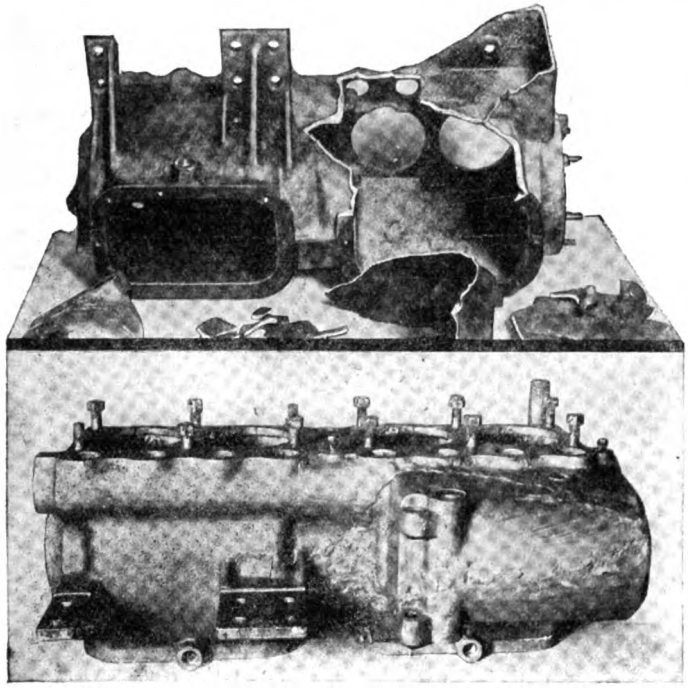
The low and high speed jets insure an economical but always adequate supply of quickly explosible gas, governed by the suction of the cylinders.

The result is a saving of from 30 to 50% of gasoline in all motors — a power increase of from 42 to 100%. Think what this means in these days of high prices.

As a by-product you get a greater flexibility— a more rapid acceleration — quicker pick-up — better idling, and an Herculean hill-climbing power that in itself is worth more than the purchase price.

Owners—Ask Your Dealer or Order From Us To-day

Dealers—*We'd much rather have YOU take these profits—Write us, and we'll show you how to cash in on our advertising.*



Sunderman Corporation

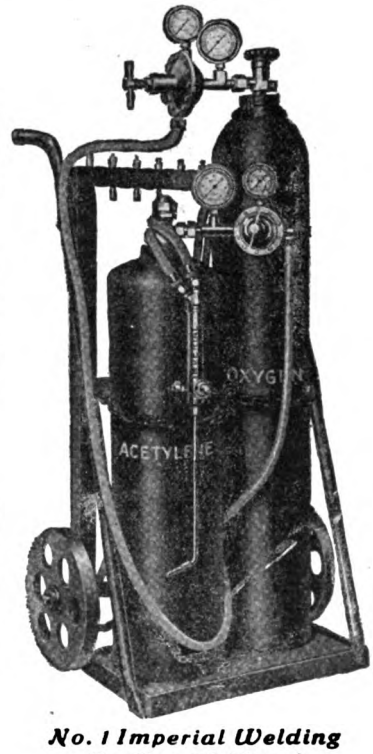
IMPERIAL WELDING CUTTING EQUIPMENT
OXY-ACETYLENE·OXY-HYDROGEN

Build Business Through Thrift of Auto Owners

Before and after being repaired by use of Imperial Cutting and Welding Equipment



With such an increasing percentage of old cars being overhauled and repaired this year, as a conservation measure, 1918 promises greater opportunities than ever for substantial profits in automobile repair work.

It's up to you to have the best-equipped garage or repair shop in your territory, in order to handle the big jobs. It's practically impossible, any more, to get along without such safe, economical, efficient welding and cutting facilities as are provided by

IMPERIAL WELDING AND CUTTING EQUIPMENT

In the shop or on the road, Imperial Equipment quickly welds broken axles, cracked cylinders, transmission cases, in fact all metal parts. Cuts all steel and wrought iron and decarbonizes cylinders more thoroughly than by any other method.

An Imperial Outfit will quickly pay for itself through added volume of repair business it makes possible. Convenient, and **always ready for use,** it is indispensable as a part of the tool equipment of every up-to-date garage. Write today for the new free catalog, containing complete information of value to you.

No. 1 Imperial Welding Outfit with Truck

A Good Jobbers' Proposition

Jobbers alive to 1918 business possibilities in the auto-repair field, should get in communication with us at once. It will pay you to further the distribution, not only of Imperial Cutting and Welding Outfits and supplies, but of other high grade Accessories, such as Imperial Compression Couplings, Gasoline Cocks, Strainers, etc.

The MUNGER "ALWAYS TIGHT" PISTON RING OUTFIT—
8 Always Tight Rings
4 Always Tight Rings
1 Regrooving Tool
1 Ring Insertion Tool

MUNGER "Always Tight" Piston Rings

Ready to insert the Munger Re-grooving Tool to true-up a worn piston groove.

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an over-width ring.

A Munger "Always Tight" Piston Ring being slipped over the Munger Ring Insertion Tool.

Showing how easily Munger "Always Tight" Piston Rings can be placed in the piston grooves with Munger Ring Insertion Tool.

List price for all sizes up to 3¾ in. diameter, $1.25 per ring.

With each complete outfit of rings, a *Munger Piston Re-grooving Tool* and a *Munger Ring Insertion Tool* are supplied without extra charge.

Put more pep into your engine!

Get the full impulse out of every drop of gasoline.

Munger "Always Tight" Piston Rings permit no loss of power. They hold compression until completely worn out.

By a patent process of peening they are made to conform to the shape of the cylinder, and this with the Munger "Always Tight" Expansion Joint makes them permanently gas-tight. Gas cannot waste over, under, or through them.

Munger "Always Tight" Piston Rings are the easiest of all rings to install. Slip them over the Munger Ring Insertion Tool (included with each complete outfit) and they slide into the grooves without breakage or trouble of any kind.

With each complete outfit of Munger "Always Tight" Piston Rings is one *over-width* ring for each piston (to be used in worn grooves) and a Munger Re-grooving Tool with which worn grooves can be straightened quickly and accurately without resorting to expensive lathe work, and without even disconnecting the piston from the connecting rod. This is a big saving for both the repairman and the car owner.

RAJAH FEATURES

Simple Construction

The Rajah Plug embodies no freak ideas or experiments. There are but five parts, all interchangeable, easily taken apart, cleaned and assembled.

Knife Edge Bushing

adjusts itself to the shoulder of the porcelain. All possibility of injuring the porcelain is thus eliminated when the bushing is tightened down to secure a gas-tight joint.

Insulation

consists of the highest grade, hardfire, heat-resisting porcelain, of special pattern, so assembled as to insure against firing through.

The Button Top and Rajah Clip Terminal

do away entirely with the necessity for either thumb screw, nut or other device for attaching the cable to the spark plug.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used with any car.

Rajah Regular Clip Terminal

Adjustable to any cable. With the extra collar supplied fits any make of plug.

Rajah Ferrule Clip Terminal

With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Thumb Nut Terminal

Adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman.

Rajah Stud Terminal

Adapter for Buick, Chevrolet and Oldsmobile.

Manufactured by

Rajah Auto-Supply Co.

Bloomfield, N. J.

Sales Department

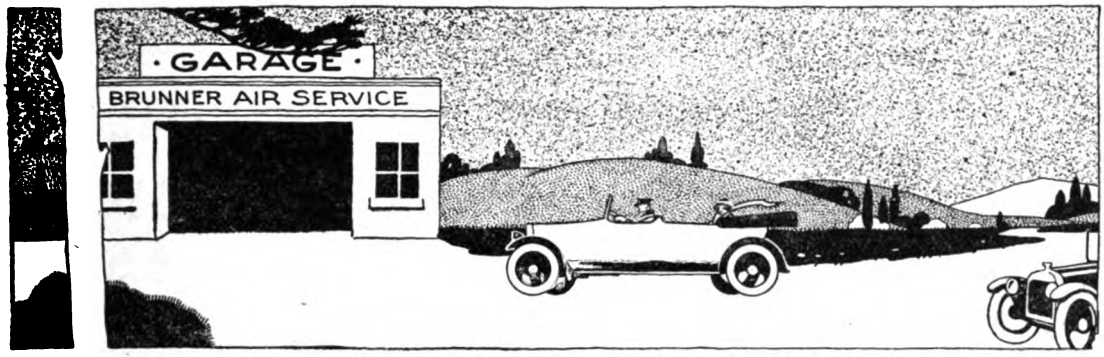
Edward A. Cassidy Co.

280 Madison Ave., New York

Backed by the racing world

IN a few vivid moments the racing car driver asks more of his car than the average car owner demands in six months' ordinary running. For his supreme needs the racer uses Rajah Spark Plugs because he knows they will make good.

While the demands of your customers are not so exacting, they do want the service, the efficiency, the power and the economy that a perfect and consistent spark plug will give. They get these qualities when you sell them the plug upon which the racing world depends.



Sell Rajah plugs in sets. Get your customers to take out all other plugs and try Rajahs as they should be tried.

That is the only way for them to enjoy the increased power, quick pick-up and uninterrupted Rajah service.

RAJAH SPARK PLUGS

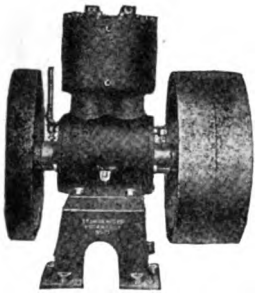
Are You Prepared for the Big Spring Drive?

It is only a matter of a few weeks now, Mr. Garageman, when the roads will be alive with motorists eager for service, and the most important service in the early Spring is your Compressed Air Service.

No. 66

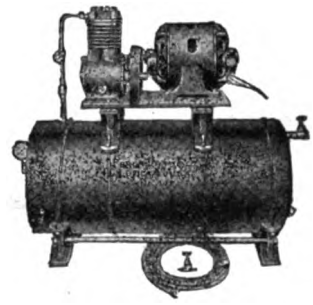


WHEN "LAST SUMMER" TIRES BEGIN TO BLOW

In the early Spring, when the boys are trying to coax more mileage out of "last summer" tires—then is the time your compressed air supply is taxed to the utmost and—then is the time you should be in position to make a favorable impression on the motorist by having your air supply ready to meet his demands.

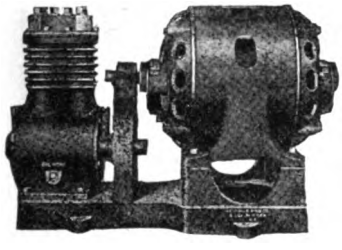
No. 50

Is Your Compressed Air Service Going to Pass Muster This Spring?



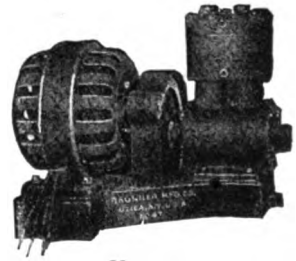
No. 17

This is a question which should be most carefully considered by you just now, Mr. Garageman, because if you do not show the motorists that you are able to deliver the goods in the Spring they will not go out of their way to patronize your garage during the long Summer months that are to follow.



THESE ARE DAYS OF PREPAREDNESS

And those among you who prepare for the big Spring drive will taste the fruits of victory—the best way to prepare is to install a Brunner Air Compressor in your Garage.



No. 542

INVESTIGATE THE BRUNNER AIR COMPRESSOR

No. 42

The Brunner is the pioneer of all Garage Air Compressors—it has been making good in the garage ever since the garage business has been a business—the Brunner Air Compressor is properly designed and built to suit the garageman's special requirements. No freakish attachments and no restriction of the lubrication to invite disaster but simply the same good substantial business proposition it has always been for the garageman who progresses with the times.

No. 47

Our new No. 15 Catalogue is the most complete and comprehensive book of its kind ever published. We will be glad to send you the catalogue and the name of the Brunner Jobber who covers your territory.

YOU CAN FIGURE IT OUT FOR YOURSELF

TOOLS For Repairing Automobiles

The possible curtailment of the manufacture of passenger cars will naturally bring all cars now in use more often to the Repair Shop. This puts a responsibility upon the Repair Man that must be met—more and more automobile repair tools will be required—are required right now—you can figure it out for yourself.

G. T. D. Tools are favorites the world over because of their easy cutting and lasting qualities.

Our line includes the following:

Taps and Dies, for both hand and machine use.

Screw Plates, both U. S. standard and S. A. E. standard threads, including combination assortments containing both standards.

Threading machines for bolts and nuts.

Reamers, all kinds, single and in sets. Also special Reamers for Ford Cars.

FOR THE MANUFACTURER

We have developed several new and decidedly better tools for machine threading. These are the "Gun" Tap—the "Shear-Cutting Tap," the "Acorn" Die and the Wells Self-Opening Die. These tools will positively boost production and reduce threading costs.

Send for catalog and booklets showing these and other tools for machine use. Ask for Gage Bulletin "How to Measure Screw Threads."

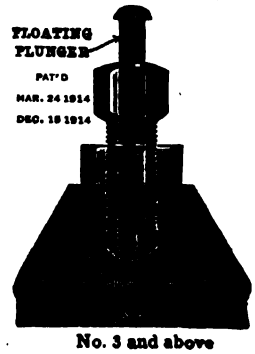
SPECIALTIES

Mosco No. 200 Timer for Ford Car



Patented Oct. 31, 1916

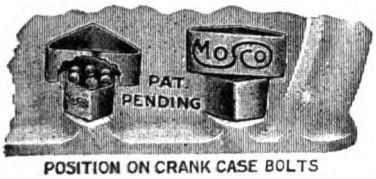
The case is made of extra heavy pressed steel, finished in aluminum. Gray bone fibre is used for raceway, with steel inserts dovetailed in and all lathe finished to a polished surface. The threaded terminals are insulated by fibre washers all the way through to contact points, thus removing cause of short circuiting common to this style of Timer.

Price, complete with brush, $1.50 each. Brush assembly only, $0.40 each.

Mosco Floating Plunger Wheel Puller

No. 3 and above

Starts a "Frozen" or "Stuck" wheel instantly. Strike the plunger; turn the screw, strike again and the wheel comes off without injury to hub-threads, spokes or axle.



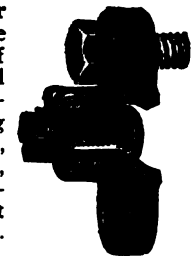
Made for 200 models of 40 popular cars.

Mosco Socket Nut and Bolt Holder for Ford Car

A REAL TIME SAVING DEVICE. Takes the place of that other man whose help is usually required for this operation.

Simply slip MOSCO Nut and Bolt Holder over the top of each engine or Transmission nut or bolt head, the wings protruding above the hex socket engage wall of crank or transmission case and prevent nut or bolt head from turning while the man underneath the car unscrews the bolts.

When replacing put head of bolt on top, slip on the MOSCO socket and proceed as in taking out.



POSITION ON CRANK CASE BOLTS

Made of heavy pressed steel, with reinforced wings welded to body of socket. All case hardened and finished bright.

PRICE 15c EACH.

Mosco Anti-Rattling Ball Socket for Steering Rod of Ford Car

AN ENTIRELY NEW DESIGN. For taking up the wear and eliminating the rattle on worn ball sockets on both ends of steering gear connecting rod. An occasional packing of hollow hex plug with grease insures proper lubrication, smoother working and reduces wear. Tension of flat spring, which is held in position by head of bolt, prevents the hex plug in end from unscrewing. Slotted in hex end so that adjustment can be made with screw driver or wrench. Made of high grade semi-steel.

No. 2

PRICE 20 CENTS EACH.

CONNECTICUT

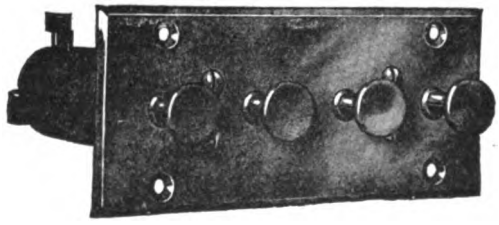
Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.



One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS
The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.

HEAD, SIDE AND TAIL LIGHTS
Head and tail lamps on and off together. Side and tail lamps on and off together.

DASH LAMP
Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

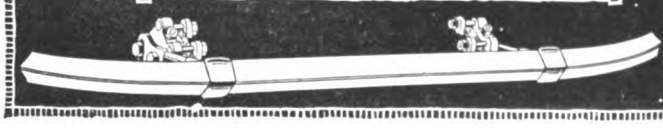
The Oro Dealer should be Your Dealer.

GOOD as GOLD

THE Oro Dealer has a line of Auto Accessories that are well made, perfectly finished, and backed by an uncompromising guarantee.

Oro
GOOD as GOLD



Accessories give the kind of service automobile owners like to dream about but seldom get.

Each Oro Product has been made to fill a particular demand. It has come into being because its manufacturers felt the need of a quality article in that field. Yet the cost of Oro Accessories is very moderate.

ALREADY

Some of the biggest truck makers in America have recognized the value of the Buell Explosion Whistle. The Pierce-Arrow, White, Little Giant, Columbia, Mack, Selden, Sandow and many others are equipped with this device, or install when so requested. It has proven the best in operation and durability.

THAT Is Conclusive Proof of Quality

It is also evidence of the rapidly growing DEMAND for the Buell. Not only manufacturers but thousands of private owners are daily recognizing Buell superiority and discarding old type signals for this very latest and most efficient safety warning device. Its 10-year guarantee; its simplicity of design and operation; its power secured directly from the engine; carry great weight with buyers.

Each Buell sold means a satisfied customer and increasing sales and profits for Buell dealers.

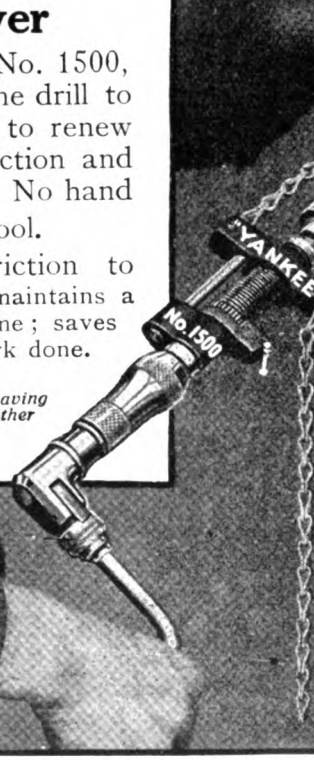
"YANKEE" TOOLS Make Better Mechanics

Multiplying Man's Power



With the "YANKEE" Chain Drill, No. 1500, you don't use your fingers to advance the drill to the work; nor stop at every few turns to renew the cutting feed. The "YANKEE" Friction and Ratchet Feeds do both—automatically. No hand feeding at all! *You* simply revolve the tool.

Feed is instantly shifted from Friction to Ratchet, or back, at a finger touch. Ratchet maintains a fixed, positive feed. No guesswork! Saves time; saves drill breakage; saves the man; and—gets the work done.

Your dealer can supply you

Write for free "'YANKEE' Tool Book" of time- and labor-saving tools for garage or repair-shop—Bench, Chain, Breast, Hand and other drills; wood-boring and screw-driving tools.

NORTH BROS. MFG. CO. PHILADELPHIA, U. S. A.

"YANKEE" Chain Drill No. 1500

"YANKEE" Chain Drills are indispensable for automobile work.

No. 1500—3-jaw chuck for rounds up to ½ in. Length, 9¾ in. Weight, 3¼ lbs.

No. 500—2-jaw chuck for squares up to ½ in. Length, 10¾ in. Weight, 3½ lbs.

Square thread screw; hardened ends; ball bearing.

Price, $3.90

"YANKEE" Breast Drill No. 555 is often used to operate Chain Drill.

A PATCH

That Will Not Loosen, Leak Creep or Blow Out!

20th CENTURY

Self-Vulcanizing Patch

Makes Permanent Repairs Instantly, and Without the Use of Heat or Tools

It is a three-ply Patch, using a ply of raw Red Rubber next to the inner tube, which guarantees a quick, smooth job of vulcanizing; then a ply of semi-cured rubber next to the khaki cloth. This rubber is not affected by the heat and will not melt, making our Patch absolutely **Leak-Proof;** then comes the ply of best grade khaki cloth, which gives the Patch its strength and durability.

This Construction Makes a Patch We Guarantee Not to Loosen, Leak, Creep or Blow Out, and to Give Satisfaction in Every Respect.

Leak-Proof

Made in 4 sizes	2¼ x 16—	36 Square Inches	$0.50
	4 x 15—	60 Square Inches	.75
	6 x 18—	108 Square Inches	1.50
	7 x 75—	525 Square Inches (Garage Size)	4.00

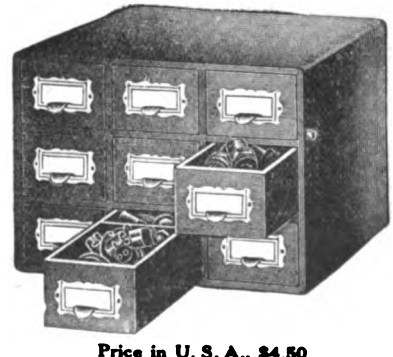
If you want a Patch, call for a "20th CENTURY." We make all kinds of Patches, all Sizes and Prices.

If your JOBBER or Dealer has not got them, write to us direct.

20th CENTURY TIRE PROTECTOR CO., MIDLOTHIAN, TEXAS

Two New Money-Makers

Presto BULB TESTER



Price to Dealer $4.00 in U. S. A.
Price to Dealer $6.00 in Canada.

Here are two new members of the family of meritorious and useful Presto Specialties. Both of these accessories are business builders, putting your business on a systematic and accurate basis.

The Presto Bulb Tester determines accurately the voltage of all automobile electric light bulbs, and tells you instantly whether the bulb is burned out or not; all lamps of any voltage from one and one-half volts to twelve volts. The lever switch has different contact points for one and one-half volt, three, six, nine and twelve volt bulbs. It attaches to any ordinary 110 volt lamp socket. Equipped with seven feet of lamp cord. It is enclosed in a neat metal case black enameled with nickel plated trimming. Every dealer needs at least one of the Presto Bulb Testers so that he may test all the bulbs he buys or sells and be assured of the correct voltage of each bulb, and that all lamps are perfect when sold.

Presto CABINET

Price in U. S. A., $4.50
Price in Canada, $6.50

Garages, dealers, and repair shops need this cabinet to keep their electrical Edi-Swan Fittings for the lighting equipment of automobiles in neat array and easy access. The cabinet is 12"x12"x9" mission finished wood and contains 9 drawers each with a division, giving 18 spaces in which to keep connectors, plugs, switches and other small accessories.

These are but two of the 100 useful and necessary Presto accessories. Write today for our complete catalog.

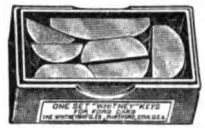
"WHITNEY" KEYS

FOR THE

WOODRUFF SYSTEM

For the benefit of dealers, garages, and repair men, we are prepared to furnish our keys put up in two assortments. Every garage and repair man should keep these on hand. They may be purchased from the leading jobbers or ordered direct from the factory.



Regular Assortment

One hundred keys of the sizes most likely to be required for repair work.

Ford Assortment

One set of keys for the Ford car. These keys are of the special material and special treatment specified by the Ford Motor Company.

THE WHITNEY MFG. CO.

HARTFORD, CONN.

Chains Keys Hand Milling Machines

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

Auto Books

Just Out

The 1918 edition of **Automobile Engineering** answers 10,000 questions on the construction and repair of all types of pleasure and commercial cars, including 1918 models. Two entire volumes are devoted to the various ignition, starting and lighting systems, and hundreds of wiring diagrams have been added. Welding, vulcanizing and public garage operation are thoroughly covered. Five thick volumes, 5¾ by 8¼ inches, flexibly bound in genuine leather, gold stamped. 2,500 pages; 2,100 illustrations, diagrams, etc., that make difficult points as simple as A-B-C. Written in plain, every-day language. Concise and to the point.

7 Days' Trial

Signing and mailing the coupon brings all five volumes to you for seven days' trial. Don't send a penny—just pay the small shipping charge when the books arrive. Read them—study them—examine them carefully before you decide to buy. If they fail to please, return them **at our expense.** If you keep them, send $2.00 within seven days and $2.00 a month thereafter until $17.80 has been paid. The regular price of this set will be $25.00, so act now!

TELLS ABOUT

Welding, Motor Construction and Repair, Carburetors, Valves, Cooling, Lubrication, Fly-Wheels, Clutch, Transmission, Final Drive, Steering, Frames, Tires, Vulcanizing, Ignition, Starting and Lighting Systems, Wiring Diagrams, Shop Kinks, Public Garage Operation, Electrics, Storage Batteries, Steam Cars, Motorcycles, Commercial Trucks.

Consulting Service FREE

In addition to the books you get free of all charge a $12.00 Consulting Membership. If any question puzzles you—write us. Our corps of auto experts will solve any auto problem. Ask all the questions you want for a whole year. This service is absolutely free.

MAIL This Coupon

See these books before you decide to buy. Remember—don't send us a penny. Just fill in and mail the coupon. This offer is open to any person living within the boundaries of the U. S. and Canada.

"NORMA"

"NORMA" BALL BEARINGS

(Patented)

Performance must be built into a machine—it is a thing inherent, not alone in the machine as a whole but also in every part, every construction detail. Failure of a so-called minor part or minor detail, impairs machine performance as surely as a break-down of the machine as a whole.

Failure of ignition or lighting system may result from a failure of a bearing in magneto or lighting generator. To safeguard against which, makers of these electrical accessories of the highest grade—of maximum performance capacity—have standardized on "NORMA" Ball Bearings.

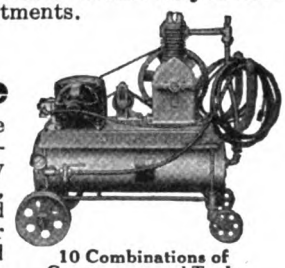
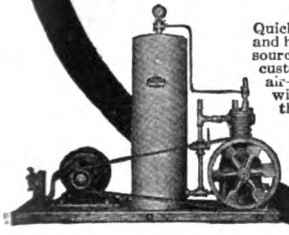
WINTER BUSINESS—COLD WEATHER MADE PROFITABLE.



CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference



Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current

Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

PROVEN ABILITY

Performance sells spark plugs. Results, only, interest your trade. Cars and trucks cannot be delayed by faulty ignition. Motorists demand rugged power — economically.

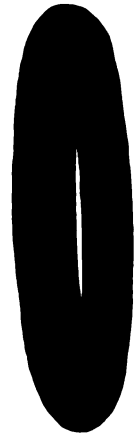
REFLEX SPARK PLUGS

—keep sales on the go—because every one is built for performance. Reflex dealers do not have to argue—they simply point to the fact that as standard equipment on the thousands of White Trucks in gruelling service in the war zones, Reflex Spark Plugs are proving their ability.

REFLEX equipped White Trucks tearing up rails under their own power. A striking example of REFLEX performance

Built of Chromite war-service porcelain, Reflex Spark Plugs stand extremes of heat. All points are made of non-pit metal.

Write for our profitable proposition. Your territory may still be open.



THE REFLEX IGNITION COMPANY
1711 Payne Ave. Cleveland, U. S. A.

SECONDS
Firestone Super Cord

We know of no other tire with a record to surpass this—you all know that what is called a second at the Firestone factory anybody else would call a first—nothing really the matter with it—just a slight surface blemish or mould mark. We were very fortunate to get these splendid seconds—but you are luckier than we are because you gain more in prestige, miles and profit where we get only our regular margin.

PECK'S SUPER HEAT MANIFOLDS

Are Doing Their Bit

Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

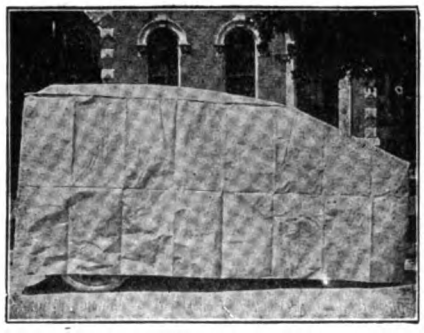
Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

West of Rocky Mountains, $8.50

If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.

With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.



If Your Dealer Can Not Furnish You, Write to Us Direct.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

NATIONAL RUBBER FILLER CO.
208 College Street MIDLOTHIAN, TEXAS

DETROIT DETACHABLE WEATHERPROOF TOP

Absolutely Storm Tight from Windshield to Rear Window

Eliminates, instantly, all the Ford drivers' former hardships. It is the only all-weather top that does away with the objectionable features of a detachable top and affords the car owner an enclosed or open body for year-round use at a really low price.

It is Absolutely Rattle Proof and Will Last as Long as the Car

Detroit easy sliding flexible doors, which disappear into the roof, are three inches wider than the doors of the Ford; this gives ample entrance for the occupants even though the arms may be filled with bundles. For the other 9 big improvements, see our literature.

SMITH AUTO SIGNAL

One signal box only on the left rear fender shows the words above in red, both front and rear—day and night.

Passenger automobiles in New York City alone were responsible for 7,419 accidents in 1917, which resulted in 225 deaths.

The Smith Auto Signal provides the cheapest insurance against accidents and the fear of accidents. It distinctly signals your driving intentions to both those in back and those in front—and also the traffic policeman.

Front View of Car Showing Smith Auto Signal

Operates from plainly marked single handle three-way switch. Very little electric current used.

Simply constructed—nothing to get out of order. Easily installed—directions with every signal.

Already installed on 40 different makes of cars. Measures 6" high by 5" wide by 4¼" deep. Weighs only 3½ pounds.

Price Complete, $17.50

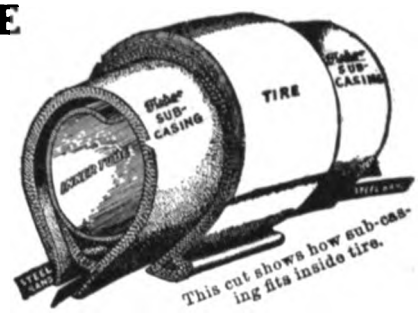
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

FISHER MANUFACTURING CO.

Talking 100% Lubrication To Your Customers

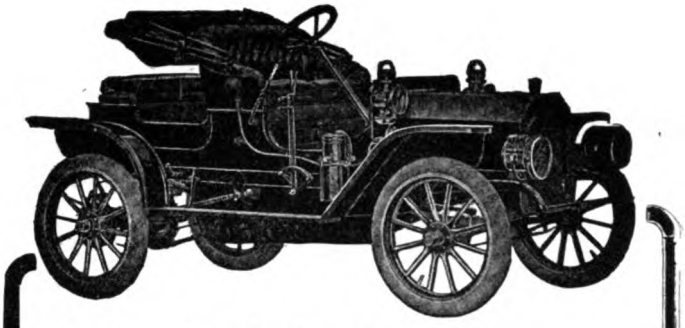
We are going to demonstrate to your customers why they should use Dixon's Graphite Automobile Lubricants and prove to you why you should sell them. Their use means more power to your customers and better business for you.

Our force of specialty men is spreading the message of 100% Lubrication. Wherever they go they convince dealers and motorists that

DIXON'S GRAPHITE Automobile LUBRICANTS

are better lubricants. Demonstration proves it every time.

This year we will again back up the efforts of our sales force with a campaign of newspaper advertising that will reach millions of motorists. We are going to keep right at it, week after week, as steadily as an engine that never "skips."



Our salesmen prepare the ground. Our advertising sows the seeds of heavy sales of Dixon's—the 100% Lubricants. Be ready to garner your share of this business, and cash in on our campaign of lubrication education.

SHALER

5 Minute Vulcanizer

Mends Tubes in 5 Minutes

Easy to Use— Easy to Sell

Every buyer of a SHALER 5-Minute Vulcanizer becomes a booster! Every motorist who buys one shows it to his friends—gives them a demonstration—because it is such a wonderful thing.

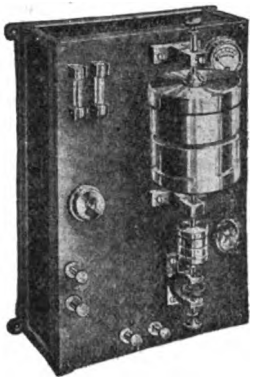
This means big sales for you. As soon as you start selling the SHALER 5-Minute Vulcanizer, your customers will spread the news. You will quickly notice new faces in your store—new customers passing their money across your counters.

Complete Outfit $1.50
Including 12 Patch & Heat Units

The six round and six oblong patches and combustible discs that go with the vulcanizer are soon used up—and the motorist comes back to you for more. He pays you 75 cents for every dozen of these units. You make a good profit.

Can you realize what a big repeat business this means for you? Can't you see how it will bring car owners into your place for additional "ammunition"—who will also buy other goods? And that is what you need to build up your business!

Place Your Order with Your Jobber NOW



Don't delay! The enormous demand for SHALER 5-Minute Vulanizers has exceeded our factory capacity to make deliveries. We are building a large 3-story addition to our plant. But—to make sure of prompt shipments—place your order with your jobber now - specifying date of shipment desired.

How to Overhaul Your Own Car and Put it in Condition for the Coming Season

Practical Instructions for Car Repair, Showing the Owner How He Can Do the Work Himself and Release Mechanics for Government Work

BY C. P. SHATTUCK, M. E.

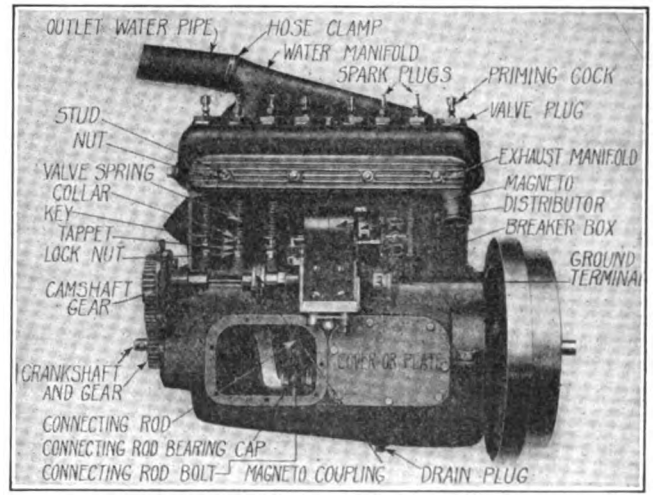
In these days when the Government is urging thrift and economy it behooves us motorists to do our share in the preparation of the motor car for the riding season which is fast approaching and by so doing we will release mechanics and repairmen

The Components of the Cooling System Require Attention and Include the Fan, Pump and Water Pipes.

to serve Uncle Sam. The writer does not wish to convey the impression that every owner of a motor car is capable of completely overhauling his machine. While many are capable of accomplishing the work there are others who lack the necessary knowledge and experience. These owners can do the preliminary work, however, and by so doing they will save much expense.

When to Use Expert.

In other words, the writer suggests that much of the work requiring experience, such as adjustments, etc., be left to the expert. It is not a difficult matter to obtain the services of a thoroughly competent repairman who makes a specialty of repairing in the garage of the owner. And it is not impossible to arrange with some expert to do the finer work on Sundays. Many repairmen are glad of the opportunity to make a little extra money to say nothing of the pleasure to be derived in bossing the novice. From the above it will be obvious that the owner can considerably reduce the cost of the overhaul.



Tools, Equipment, Etc.

One of the first things to be considered by the owner attempting his first overhaul is the tool equipment. The necessary tools and equipment were fully described and illustrated in the December issue of The Automobile Dealer and Repairer and if you have not read the article it is suggested you do so. It is not always essential to purchase a big list of tools, for many times they may be borrowed from a neighboring motorist. The supplies may be secured as required. The necessary material, including new parts, may be listed during the work of pulling down the chassis, and it is suggested that these be set down as the work progresses. It will save time, in that the new part may be ordered and received before needed. This is important in these days of freight and express congestion.

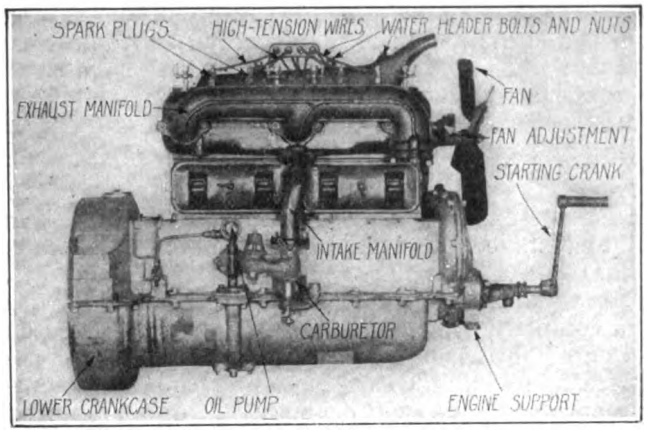
Displacing the Body.

Before attempting any work obtain an instruction book and make a careful study of the chassis, learn the location of each part and how it is secured, etc. Assuming that the car has seen considerable service and a complete overhaul is to be made, the first step is to carefully wash the car, then strip it of all accessories, including those stored in the body compartments. If the winter body is to be replaced with the touring, see that the former is thoroughly cleaned before putting it away.

It is a simple matter to disconnect such parts as

A Conventional Type of Engine With Parts Lettered to Enable Owner to Begin the Work of the Overhaul.

the ignition wiring, timer-distributor, fuel connections, etc., but it is not so easy to replace these correctly; that is, for the novice. Study all of the



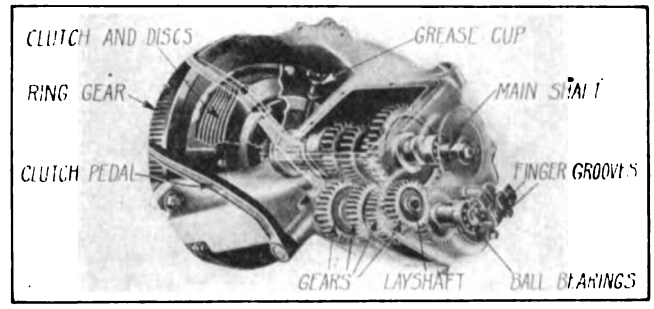
Digitized by Google

members and note how they are connected, particularly if any must be disconnected before removing the body. Make sure that all are free before attempting to lift the body from the chassis. If the fuel tank be located in the body the unions, etc., must be disconnected, and it is a good plan to drain the tank. Lift the body with a falls and tackle and place on stands. Previous to this work flush or clean the radiator with a soda solution or a marketed preparation.

Cleaning the Chassis.

After removing the body roll the chassis out of doors. Now it may not be agreeable to work with liquids out of doors at this time of the year, but grease and foreign deposits should be removed from the chassis and one does not want the garage floor dirtied. A stiff brush and kerosene will clean all parts, but before beginning the work cover the magneto, timer-distributor, carburetor, generator and engine starter.

It is assumed that the radiator has been drained. Next study the cooling system before attempting to remove pipes or separate connections. Study all wiring connections, ignition, lighting and starting. Use the instruction book and tag any wire that you



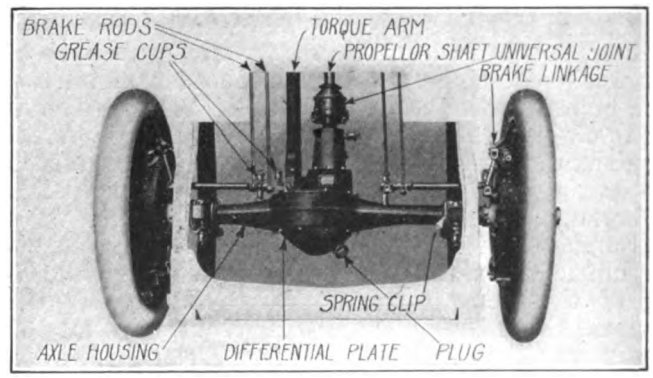
The Members of the Engine Lubrication Family Should Be Cleaned and Carefully Examined in the Overhaul of the Power Plant.

may displace. As you will doubtless displace the ignition wires, primary and secondary, tag these carefully. This will save trouble when replacing the wires.

Removing Radiator.

To displace the radiator it will be necessary to disconnect the rubber pipes of the inlet and outlet manifold or pipes, also the rod supporting the hood and connecting the radiator with the dash. Examine the method used for supporting the radiator which should be carefully handled in the removal and after. If leaking send the radiator to the expert for repairs. Examine the rubber tubing and hose clamps. The plies of the former may have become loose or separated and the clamps may be damaged. Procure new hose and clamps. Enter the sizes of these on your list of parts and material needed. The old hose can be used to determine the size required. Measure the length of each piece, then cut them in two so as to obtain the correct inside diameter. Do not consider the diameter or part slipped over the metal pipes, as these have been expanded or increased by use.

It is not practical to give other than general directions for removing the power plant as the construction varies. Some engines may be removed easily, while other designs will require a careful study of the method of retention. The unit type, the engine—the clutch and gearset—is handled



Phantom View of the Disc Type of Clutch and Sliding Gearset or Transmission.

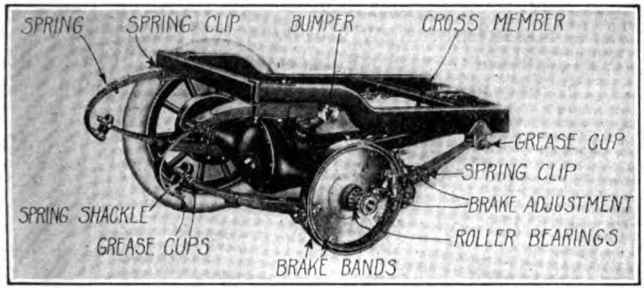
fairly easily, especially when the gear shifting and emergency brake levers are incorporated with it. A careful inspection of the drive from the engine when the transmission is a separate unit should enable one, with the aid of the instruction book, to free the engine from all driven mechanism. One of the advantages of removing the engine to the bench or an engine stand is to facilitate the work of adjusting the bearings, etc., but in the majority of overhauls the engine may be left in the frame. This applies to those cars which have seen but little service and may not need other than a resetting of the valves, removing of carbon and minor adjustments.

Stripping the Power Plant.

Previous to the routine mentioned should be the preparation for the large as well as small parts. Clean the work bench and its shelves and have a number of wooden boxes for the nuts and bolts removed from the engine, etc. It is a good plan to paste a strip or label on each box and as the nuts and bolts are taken from a certain component, mark its name on the label. This may appear to be a useless precaution, but after one has seen the hundreds of nuts, bolts and small pieces used in a chassis, he will wonder where they all go. And you do not want any left over or be short when the work is completed. Placing the parts in a box as suggested will save time and labor.

Specific instructions cannot be given for disas-

A Thorough Cleaning of the Brake Assembly and Linkage Is Important.—Adjust Brakes and Renew the Supply of Lubricant.



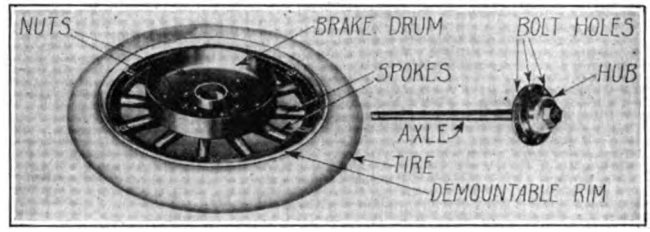
sembling each type of engine, as the design varies considerably. The components to be removed may consist of the spark plugs, priming or petcocks,

Digitized by Google

spark plug cables, valve caps, intake and exhaust manifolds, carburetor, inlet and outlet water manifold, fan belt, fan, oil pump, carburetor, magneto, starting crank, etc.

Displacing the Cylinders.

If the cylinders of the engine be cast separately, in pairs or triplets, they should be marked before removal to insure correct replacement. This may be accomplished with a prick punch, and this tool will be found handy for other purposes. Individual cylinders may be removed easily by one person if careful, but pairs and triplet castings may require two, depending upon the strength and experience of the workman. Place the cylinders to one side for cleaning. Next remove the pan or mudshield if one be used, and before removing the lower half of the crankcase drain the crankcase of old lubricant. If for any reason the camshaft or crankshaft are to be removed, mark the bearing caps so that these will be replaced properly. If the timing gears and crankshaft gear are not marked, that is, prick punched, mark them to insure correct replacement. Mark one tooth of the driving gear and two teeth



The Springs Require Careful Attention in the Overhaul.—Remove Rust and Lubricate the Leaves.

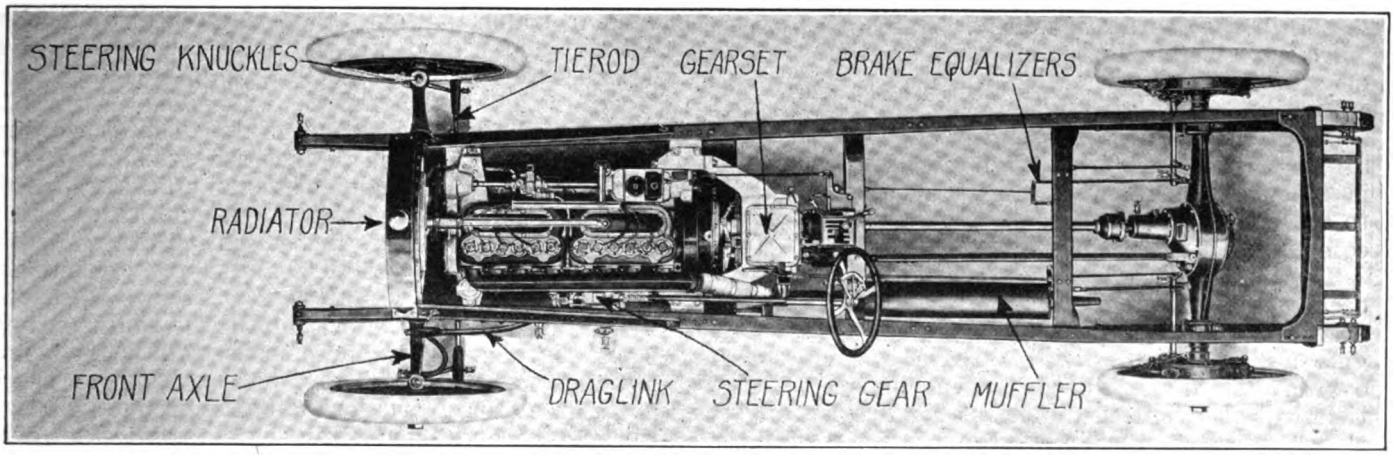
of the driven member between which the first named tooth meshes.

Pistons, Rings, Etc.

It should be stated that there are two methods used when removing cylinders. One is to displace the cylinders without disconnecting the connecting rods. This leaves the rods and pistons in their normal position; that is, the rods are not detached from the crankshaft. The other way is to remove the lower half of the connecting rod bearing or cap. When this is done the piston and rod will come away with the cylinder. Before removing the rods and pistons note which side of the crankcase the hinge of the hinged type of connecting rod is on. This is important with some engines, else the rod may be incorrectly replaced, tap the case and be the cause of a puzzling knock.

Some types of rods have what the repairmen

Inspect and Tighten Loose Nuts and Bolts and Clean and Graphite the Demountable and Tire Rims.



term mean bolts; that is, they are not easily displaced with the ordinary S wrench. Do not use a chisel, as it is poor practice and is the sign of a poor mechanic. Secure the special wrench or use a socket type. It is not always easy to start the nuts locking the connecting rod bolts, especially when one is in the pit or laying on the floor under the crankcase. When the engine is removed as a whole from the frame and swung in a stand, it can be turned upside down. It is then a simple matter to get at the nuts, etc. A pair of horses with their ends secured to prevent spreading, can be utilized for an engine stand. Overhauling the engine on blocks or a stand certainly saves many a backache.

Cleaning the Cylinders.

With the pistons displaced, the work of removing carbon is greatly simplified. Scrape the carbon from the tops of the pistons and do likewise with the cylinders. Displace the rings, and in so doing keep them in order so as to insure correct replacement. As the top ring is removed first, to replace simply reverse the order. Clean the piston ring grooves and the rings.

Much has been said in the favor of special rings. A great many motorists believe that the lost kick and "pep" of their engine can be restored by merely installing new rings. It can. But simply sticking one new ring or even fitting the piston with a new set will not obtain the results desired; that is, it won't as a rule. Piston rings must be fitted to the grooves of the piston and the rings must fit the cylinders. If the cylinders are not true, if the walls be worn, or what is termed oval, perfect rings cannot make up for this defect.

A great many times a good make of ring is

Showing Some of the Components of the Chassis That Should Be Given Careful Attention in the Overhaul.

Digitized by Google

blamed by an owner as not being what it is claimed to be when the fault is in the cylinder. Therefore, have your cylinders measured, tested by an expert who has the necessary fine reading tools to do this work. Because a cylinder looks nice is no proof that it is in perfect shape. Make sure that the cylinder is right and the rings will do the work, provided they are fitted right. Fitting rings is not a job for the novice. It requires experience and the work is best left to those who know how.

The writer is frequently consulted by owners as to the advisability of reboring or regrinding cylinders and fitting oversize pistons. This work is advisable when the other components of the chassis are in good condition. It is poor economy to spend money restoring the lost power of an engine when the other parts of the chassis are in poor shape. The cost of reboring or regrinding and fitting new pistons with rings is not prohibitive. It is well worth the expense if properly done, for it is a foolish waste of money to burn gasoline in an engine that doesn't deliver anywhere near its rated power.

Cleaning Lubricating System.

As the lubrication system of an engine is most important to its successful operation, clean it thoroughly and give special attention to the filters, screens, etc. These may be partially clogged with sediment, particularly if one has not been careful to use strained oil. Look over the pump. Certain types wear and some are the cause of that annoying little tap or knock that has bothered you in the past. Clean the lower crankcase very carefully and set it to one side. If a gasket is used, enter it on the list of material needed. Do the same with other material or parts required as the work progresses. Note the condition of the cylinder head gasket, that of the intake and exhaust manifolds, and do not take any chances, but make an entry for new ones. They are not expensive.

Starting and Lighting System.

If the car has been in service but a short time, the starting motor and generator will not require attention. But if these have seen considerable service, particularly if they have not been acting just right of late, either displace them and take them to the service station of the maker or have the expert call at your garage. And do not forget to have the storage battery looked over, for you will have ample time while the overhaul is being completed. No instructions are given for displacing the battery, motor or generator, as detailed information is contained in the instruction book.

Do not attempt to smooth up the brushes of the generator nor tamper with the adjustment of the cut-out, etc. This requires an expert familiar with the system with which your car is equipped. Much of the trouble experienced with lighting systems is due to the owner imagining a trouble and trying to correct same when the fault is due to some other component of the system.

The work laid out and the suggestions made will occupy the novice for some time, and in another article the writer will describe how to time the engine and ignition as well as give instructions for overhauling the magneto and carburetor. The article will also contain directions for overhauling the clutch, gearset, rear axle, brakes, front axle and steering gear assembly.

Ed. Note.—As may be noted, no reference is made in Mr. Shattuck's article to adjusting the bearings of the engine, fitting rings, grinding valves or restoring worn parts of the wristpin, etc. Owing to the fact that these subjects are dealt with by Mr. Bagley in his article, we were obliged to eliminate them from Mr. Shattuck's discussion.

New Highways Association.

One hundred and fifty delegates were in attendance, including representatives of 22 national and State associations, ten road machinery manufacturers, 25 road material producers, 18 manufacturers of motor cars, trucks and parts, and representatives of 18 trade periodicals and daily newspapers, met in Chicago recently and formed a national organization under the name Highway Industries Association.

The meeting adopted a constitution for the association and elected officers as follows: President, S. M. Williams, Garford Motor Truck Co., Lima, O.; first vice-president, A. R. Rirst, Wisconsin State Highway Commission; second vice-president, Lion Gardiner, Engineering News Record, New York; third vice-president, S. T. Henry, Allied Construction Corporation, New York.

Headquarters are to be established in Washington, for the period of the war, to facilitate carrying out the objects of the association, which are: "To assist in co-ordinating the highways with other transportation agencies of the country; to encourage development of highways that will advance the economic life of the nation; to stimulate their use in such a manner as to facilitate and cheapen the transportation of food, raw materials and finished products, and to co-operate with Government agencies, both State and national, to the end that our highways may be of maximum service in the transportation system of the country.

Motor Trucks in Parcel Post Service.

Within a few years the Post Office Department will be the largest single user of motor trucks in America and will operate them on rural delivery routes throughout the United States.

Recently the Post Office Department has taken a deep interest in the progress of highway improvement, the development of the motor truck and methods of utilizing both. There has been a reduction of farm production owing to the draft of man power into war service at a time when it is imperative that production should be increased. More convenient transportation would stimulate production. Although somewhat late in starting, the Post Office is endeavoring to overcome this loss through the "farm-to-table" movement.

The only way to demonstrate to the producer that it is worth while to increase production is to put some visible means of communication before him, and that is by establishing motor truck parcel post routes. There are in the United States 43,295 rural mail routes and 16,000 star routes, but the average number of pieces of parcel post matter carried per day to producers on these routes is only 8 per route, and only one piece per route from producer to consumer. There is not a single parcel post route from New York out into productive territory; only one from Philadelphia, and two from Chicago. Motor truck parcel post routes will aid producers and eventually reduce the cost of living.

Important Engine Parts Requiring Special Attention

Connecting Rods, Bearings, Pistons and Piston Rings Are Subject to Much Wear and Must Be Repaired Carefully

BY J. N. BAGLEY

In overhauling the engine it will be necessary to have a small hoist of some sort to take it from the chassis and a suitable bench or stand to lay it on while working on it. Before attempting to remove

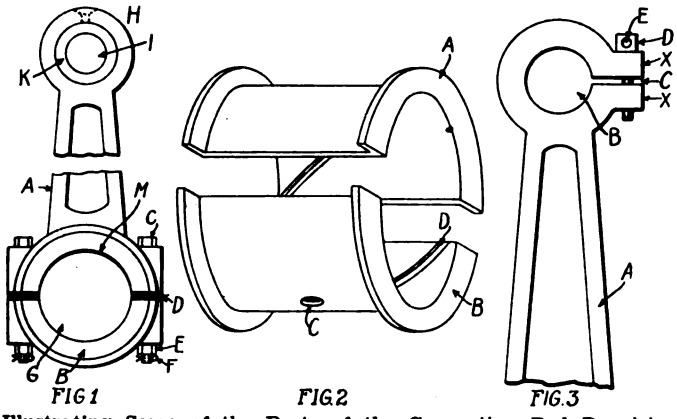

FIG 1 FIG 2 FIG 3

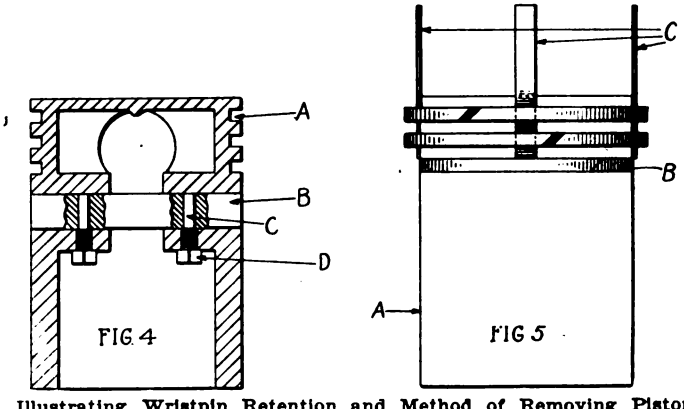
Illustrating Some of the Parts of the Connecting Rod Requiring Attention in the Overhaul of the Engine.

the engine, displace the radiator and place it where it will not become damaged. After removing the engine it should be thoroughly cleaned and this can be done with a brush and some gasoline or kerosene. When we speak of overhauling the engine we mean a thorough job, to take up all bearings, crankshaft, connecting rod and camshaft bearings; grind in and adjust the valves, look after the rings, remove the carbon, replace old gaskets with new, replace all worn or broken bushings, replace worn timing gears with new.



The parts that are apt to need the most attention are the crankshaft, connecting rod and camshaft bearings and the valves and rings. At Fig. 1 is shown a connecting rod of the most common type, A representing the complete rod. At B is shown the babbitt bushing which comes in contact with the polished surface of the crankshaft G. An engine that has been used for any great length of time may have what is termed a "flat" crankshaft, as shown at M. There are many ways of determining this which will be described later, but here we might mention that a very flat crankshaft should be replaced with a new one, for it is impossible to keep a bearing properly adjusted to a "flat" shaft.

Detailed instructions for removing the engine from the chassis are not essential, as all bolts, etc., are easily seen and removed. With the engine out, we will take up the fitting of the connecting rod. After removing the cotter pin F and nut E on each of the bolts holding the lower half of the bearing, the rod can be removed. There will be found a number of thin shims D, which can be removed, an equal number from each side, until a snug fit is had on the polished surface of the crankshaft G. Next tighten the nuts E and turn the rod around. It will turn gradually with the weight of the piston at H if properly adjusted. But in case it is very tight at one point and loose at another, we may have what is known as a flat crankshaft. If the bearing is not true it will need scraping to make it fit the shaft. Take Prussian blue and spread it evenly over the shaft, place the rod in position, tighten it up tight and turn it once around and remove, noting the places that are marked blue by the mixture. Take the bearing scraper and remove the high spots. Continue scraping and fitting until the bearing fits perfectly. The bearing will need no further attention, but should be marked so that it will be replaced correctly when reassembling the engine. Go over each bearing in this manner.

Next give the upper end of the connecting rod attention and note how the bearing K fits the wristpin I. If loose it will be necessary to remove the bushing K and replace with a new one, if not adjustable. In replacing the old with a new the little oil hole H in the bushing should line exactly with the one in the rod.

Referring once more to the bearing shown at B, Fig. 1, there are two general types in use, the die cast and the run-in bearing. The die cast is shown in Fig. 2, and can be removed and replaced at will. The run-in bearing, moulded to shape in the rod, cannot be removed except to be broken out. In case this bearing is broken or worn it is a good plan to return the old rod to the nearest service station and have a new one installed, as the service station has the proper equipment for doing the work.

At Fig. 2 is shown a type of connecting rod generally used. It differs from the one already described, in that the upper end B has no bearing at all, having bearings in the piston. This eye end has a screw E, which when tightened, pinches the

Illustrating Wristpin Retention and Method of Removing Piston Rings.

wrist pin B to prevent it crawling out of place and scoring the walls of the cylinder. There is a space, C, and the part XX do not come together. If they did, they might not grip the wrist pin sufficiently

Digitized by Google

to keep it from moving. In case the points XX bear before the pin is gripped, a hacksaw blade should be run through, removing a sufficient amount of the metal to make a correct fit. When replacing the screw D a long stiff cotter key should be inserted at E to prevent the screw working loose.

At Fig. 2 is shown a die cast connecting rod bearing. Fitting these bearings is not a difficult task. Of course they may need the fitting, as previously explained. Care should be taken that the oil channels D are open and that the hole in the lower half of the bearing corresponds with that of the connecting rod. These bearings are generally of babbitt. Some manufacturers prefer a shell of brass and making the inner lining of babbitt.

After the connecting rod bearings are adjusted, look over the pistons. At Fig. 4 is shown a cross section of a piston with the wrist pin B held by two screws D passing up through the pin at C. This style of wristpin locking device is used in connection with the connecting rod having the solid brass bearing as already described. Examine the center or bearing part of the wrist pin B to see that it is not worn. If worn replace with new. They

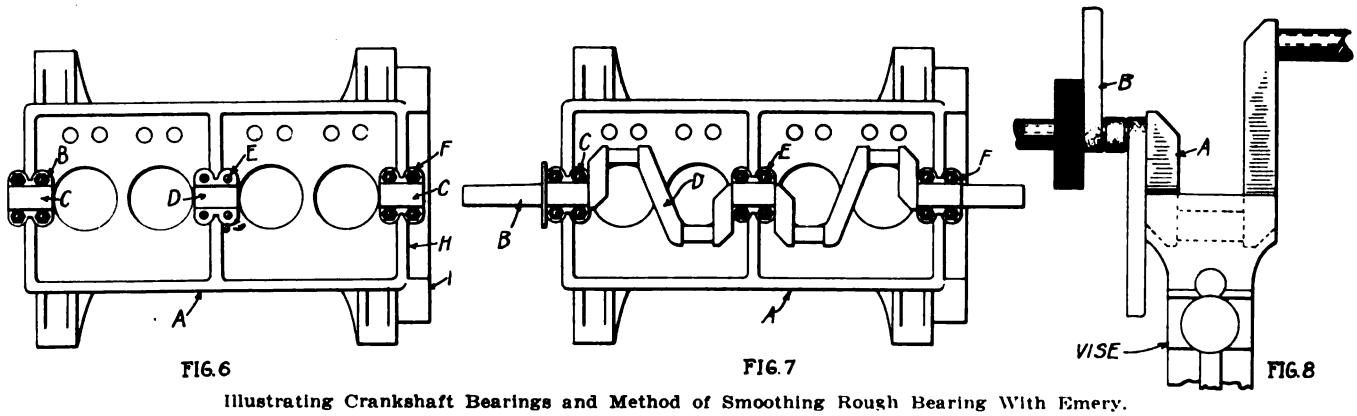


FIG. 6 FIG. 7 FIG. 8

Illustrating Crankshaft Bearings and Method of Smoothing Rough Bearing With Emery.

are not expensive. When a little loose the engine will not run quiet. Next examine the rings for wear. See if there are any black spots on the outer surface where they should bear against the cylinder. If there is, the ring is allowing the burned gas to pass and should be replaced with new ring. Remove the ring from the piston and place the ring in the cylinder and note how close the ends come together. If there is quite a little space between the ends of the ring, it will allow the compression to escape. The ring should fit the groove A perfectly; that is, it should not bind at any point so that when the loose ends are compressed they will stick and not come out. In case they do this a sheet of very fine emery cloth can be stretched over a flat surface and the ring worked over it until the desired fit is obtained. Some prefer a patented or special type of ring to the ordinary kind.

To remove and replace the rings from the piston a few strips of tin can be used, as shown at C at Fig. 5. The ring can be expanded and the strips slipped under it at three or four points. The ring can then be slipped off and on with ease. There is less danger of breaking the ring if handled in this manner than the old way of running something under one end and prying the ring off. The ring at B should fit just firm enough so that it will turn about easily after the strips C have been removed from the piston A. All carbon deposits should be removed from the ring grooves before the rings are replaced. In case the rings are a little large in diameter they can be altered with a file until they fit correctly. At Fig. 10 is shown a ring that is a trifle large; that is, when it is placed into the cylinder the ends, instead of just coming together overlap, so to speak. To remedy this, take a fine flat file and place between the ends, holding them on a level surface. Apply a little pressure to each end and draw the file back and forth until ring A, when placed into the cylinder, will have just clearance enough between the points B so that a very thin piece of paper will pass through. In case the ends are too close or the ring too large when the piston is heated the ring will expand, causing it to score the cylinder.

Not long ago the writer had a job come to the shop where the owner had put in a new set of rings, but instead of fitting them he placed them just as they came from the factory, and when they went in tight he used a block and a sledge to put them in. The result was the engine could not be turned over and the whole job had to be done over. One cannot be too careful in fitting rings. The rings and the walls of the cylinder should always be oiled when reassembling the engine.

At Fig. 6 is shown the lower half of the crankcase, that carrying the crankshaft. The crankshaft is the shaft running through the case to which the connecting rods are fastened, as already described. This shaft usually has, with a four-cylinder engine, three bearings, known as main bearings. These bearings need adjustment and attention, but not so often as the connecting bearings. The main bearings should be adjusted one at a time. For instance, the case I has three bearings, B, D, F. Remove all the caps from the bearings and note their condition. If smooth and bright, adjust. Examine the studs E and note if they are loose. Examine the camshaft bearings C for wear. Remove the old gaskets and shellac from the case. The case is now ready for the crankshaft.

At Fig. 7 is shown a crankshaft in place, but not adjusted as Fig. 7, B. With all bearings loose, begin with the back one. Take the cap from the bearing, remove a shim from each side and replace and tighten the nuts C until perfectly tight. Now try the shaft to see if tight or loose. This should be continued until the shaft just turns with a little friction. Use the Prussian blue and see how the bearing is bearing on the polished portion of the shaft. If it fits well, pass on to the next or E, and proceed in exactly the same manner, except loosen

Digitized by Google

the one just adjusted while adjusting the one next to it. When E is adjusted loosen it and pass to F, and adjust in the same manner. Now when this is done tighten them all down tight and note how

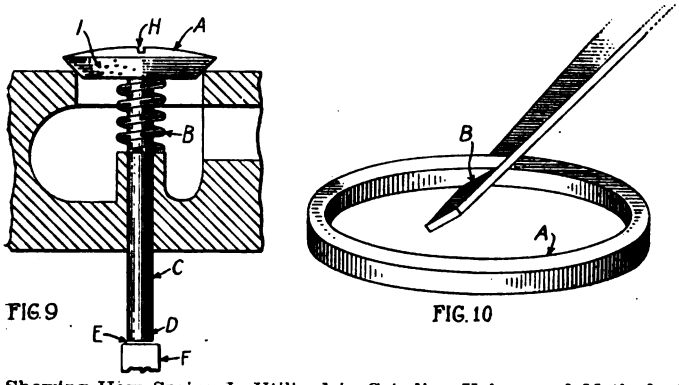

FIG. 9 FIG. 10

Showing How Spring Is Utilized in Grinding Valves and Method of Filing Piston Ring Slot.

the shaft turns. It now should turn quite stiffly, but not so stiff that a wrench will be necessary to turn it. By taking hold of the shaft with both hands on the opposite side of the center bearing, it should be turned quite easily. When this is done the connecting rods can be replaced on the shaft.

In case there is a rough spot on the shaft, it can be removed by using a piece of very fine emery, as shown at Fig. 8, B. Pull the cloth back and forth until the bearing is smooth. In case it does not have the polish desired, use pumice stone and water. Too much care cannot be exercised in fitting the bearings. Care should be taken that the oil channels do not become clogged during the operation of fitting bearings.

Next come the valves. At Fig. 9, A, is shown a valve in position for grinding. A leaky valve causes a direct loss of power, many times a missing cylinder: in fact, it affects the operation of the engine. To grind a valve proceed as follows: Place valve A into the seat with a small light spring under it, as shown at B. The spring should be stiff enough to nicely lift the valve from its seat. Place a quantity of grinding material on the valve seat and insert the grinding tool at H.

Revolve the valve back and forth, raising it occasionally and slightly rotating it. Grind until all the spots I are removed and a bright, smooth surface shows all the way around. Next wash the valve in kerosene and wash the seat. When the seat, etc., looks perfect, remove the spring B and drop the valve back and adjust the space between the push rod F and the valve stem D until a thin piece of paper will just pass between F and D. When this is done place the spring on the lower part of the stem D, locking it in place with the locking device used for the purpose and pass to the next one. Examine the guide C for wear. When worn extra air is drawn in. The intake valve guides, if worn, will cause the engine to run very irregular. In case the valve stem is worn at this point it is much better to replace with a new valve and guide.

At Fig. 2 is shown a method of forcing small solid brass bushings in place with an ordinary vise when one does not have access to a press. Open vise A up until the bushing can be started, as shown at C, into B. By tightening the screw D the bushing can be forced into place very nicely. This little kink will be found quite useful when forcing or fitting small bushings into place.

Removing the gears from the camshaft or the crankshaft is not easy, particularly without the necessary tools. A number of these gear wheels have a couple of threaded holes. They are made so on purpose. The gears can be removed with the aid of a couple of cap screws and a wrench. The sketch at Fig 12 makes plain the use of the holes. A is the wheel, B the shaft and C the screws. By screwing the cap screws down against the frame D the wheel A is gradually pulled from its sitting without much trouble or power being applied to the screws C.

CARS USED FOR BUSINESS.

Over 80 Per Cent. Thus Used, Says Car Manufacturer After Investigation.

More than 80 per cent. of the passenger automobiles in America are indispensable to business, according to data gathered in a nation-wide investigation just completed by the Haynes Automobile Co., Kokomo, Ind. A large part of the remaining per cent., it was disclosed, are essential to the personal efficiency of their owners.

The average business could not be carried on under war-time conditions, at war-time speed and with war-time economy of operation without the passenger automobile. Even the reports from those who do not use their own cars regularly for busine recognize the necessity for the so-called "pleasure car."

A letter asking for complete information regarding the individual's use of his passenger car was mailed to 1,000 owners living in all states. The names were taken at random from a list of Haynes owners, including city and rural districts. All kinds of business and all professions were represented. The letter was impartial, simply explaining the sit-

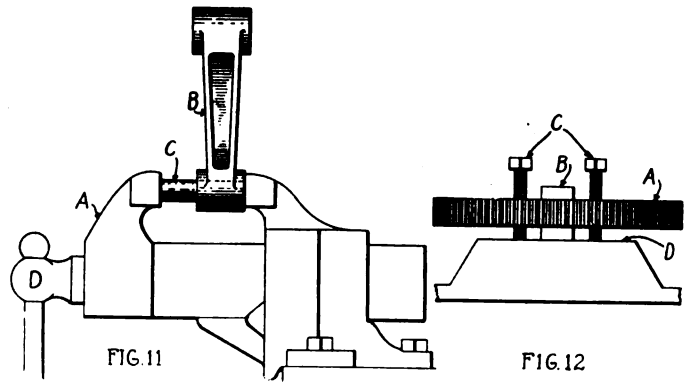

FIG. 11 FIG. 12

Showing How to Force Small Bushing in Place and a Method of Displacing Camshaft Gears.

uation and asking that a post card be filled out and returned.

Of the less than 20 per cent. who do not hold their automobiles necessary to the conduct of business, many say that without their cars their efficiency would be greatly reduced.

Cars Increasing in Savannah.

The number of cars in Savannah, Ga., is increasing, according to recent registration figures, which give that city 897 more machines in 1917 than in 1916. The total registration for 1917 is 2,310.

Workbench and Vise Installation in a Small Repair Shop

An Article Dealing with the Value of the Two Most Important Tools in the Garage, Their Construction, and Material Used

BY W. A. MANN

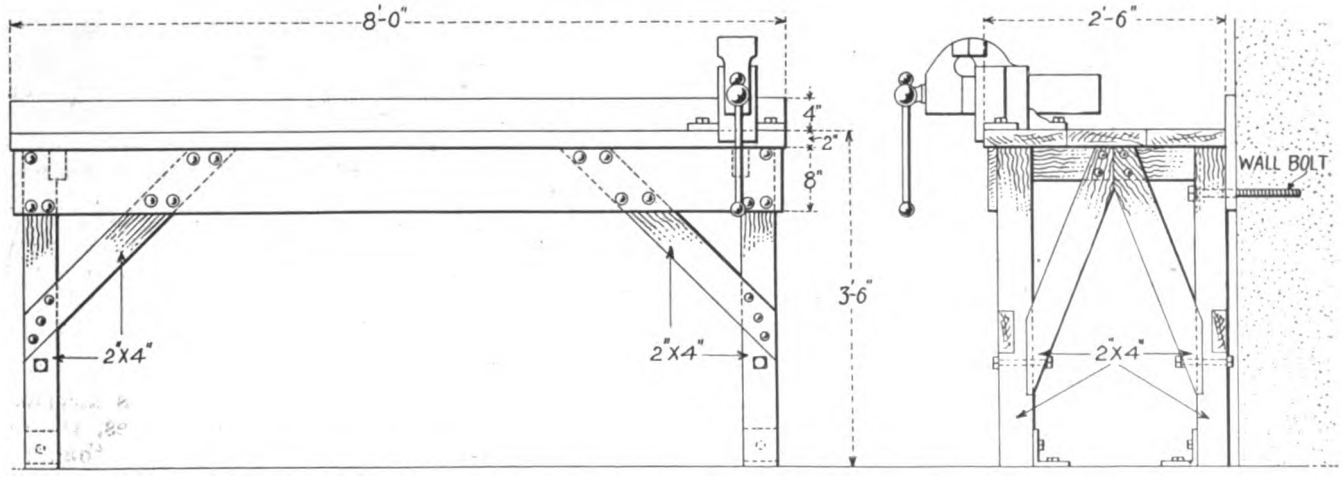
The equipment of a little repair shop is something that will cause the owner as much concern as is felt by the director in charge of the equipment of a great, big plant. Proportionately, the responsibility and the outlay are just as great, and the success or failure of the little shop may actually mean more, in personal feelings, than the success or failure of a big plant, where there are many to share responsibility and whatever financial losses there may be. Let the small shop proprietor, then, take all the care he can in outfitting his place, and let him not forget that while economy in some things is most commendable and is really economy, there are forms of saving that are not saving at all. They are merely deferred losses.

Certain matters in connection with shop equipment permit discussion in detail, and others do not. There is no use trying to go into such matters as the most desirable size or shape of a shop, or the most advantageous window arrangement or anything of that sort for, as we have said already, the man who is about to open a small shop does not build or have one built to suit himself, but takes what he can get and makes the best of it.

Hardly any two of such shops are alike, so that while a few might be benefited by assuming a certain size and shape, and theorizing upon its equipment, and fitting it out to suit the assumed conditions, the majority would be left out altogether, or would find only here and there a crumb or two of information that could be turned to account in a shop that did not fit the idealized description.

Now let's get on to practical things. The shop has been selected and it has been decided whether cars can be brought in or not; it has been ascertained, if they can, that the doors are big enough and the floor strong enough; the windows have been cleaned to admit all the light that reaches them; the interior has been painted white or whitewashed; the artificial lighting has been looked to and provision has been made for putting in lights wherever the course of events may indicate that they should be placed. Apart from that the shop is a bare room.

Start With the Benches.

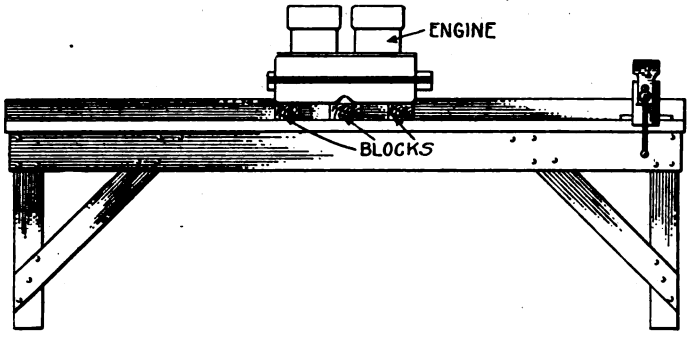


It is almost impossible to overestimate the importance of the work-benches, for the bench is, in a manner of speaking, the foundation of all hand work, such as constitutes a very large proportion, if not all, of the work of the small repair shop. There are several qualities that the bench must possess if it is to give complete satisfaction and allow good work to be done on it, but there is none that is of greater importance than solidity, both in construction and in fastening in place.

Bench Must Be Sturdy.

The bench has to support heavy weights. If it will not it is not worth calling a bench. It has to resist much pulling at parts held in the vise. It is easy to imagine the extreme inconvenience of having to humor a shaky bench when using a big wrench or a straightening bar or other leverage tool on a job in the vise, or of having to take pains to set some heavy part close to the bench supports for fear the boards forming the light top will not stand the weight. Last, but not least, the width of the bench is exceedingly important, because if it is too narrow the workman will always be more or less crowded, and the height is equally important. A man can do more work with less fatigue if the bench is the right height than if it is not.

Proper Height Important.



It is an old and a good rule that the height of the bench should be such that the top of the vise will be at the height of a man's bent elbow when he is standing erect. The only trouble with this rule is that the exact measurement will depend upon

Illustrating a Practical Bench for the Repair Shop and Dimensions for Constructing a Durable Design.

Digitized by Google

the height of the man. This is something that cannot be helped, however, and there is nothing for it but to strike a happy medium. If the top of the vise is about 42 inches from the floor it will be as nearly right as can be expected for the average

Showing How Engine May Be Handled on Bench by Utilizing Blocks.—This Avoids the Possibility of Engine Bed Damaging the Bench.

run of users. The height of the bench itself will of course be 42 inches, less the height of the vise. The height of the vise usually will run about eight inches. The exact measurement can be taken when the vise has been selected.

Good Benches Pay Dividends.

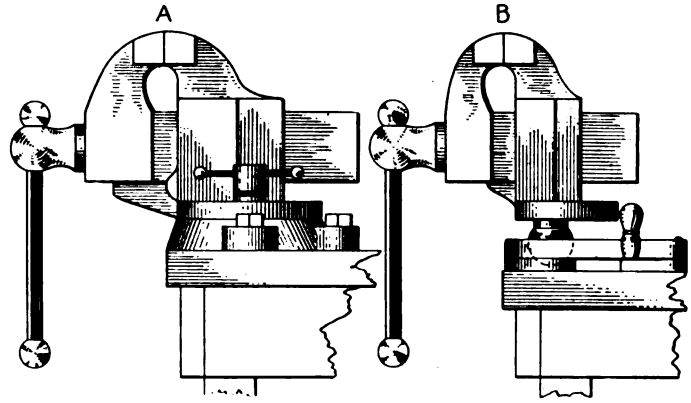
Perhaps there is no better way to build a bench than to use the iron or steel legs that are furnished by a number of concerns. These are used in a great many modern shops and are found most satisfactory in every way, though undoubtedly some makes are better than others. As a rule these manufactured legs cost somewhat more than home-made wood legs, and their extra compactness, convenience and durability make them worth the extra cost; but if it is desired to economize in this direction there can be no objection, for a perfectly satisfactory bench can be made with wood legs.

Ordinary 2x4's are suitable; hard wood is better. As to how close together the legs should be placed, much will depend upon what the bench is to carry. In many shops it is the practice to put an engine on the bench, in which case it will not be wise to space the legs farther apart than about six or eight feet. In any case there ought to be substantial diagonal bracing from the front to the back legs.

The top of the bench ought not to be less than 30 inches wide at the least, and it may very well be rather wider; if too wide, however, it will be awkward to reach back. The top should be of some hard wood; there is perhaps nothing better than hard maple, though oak is hard to beat and is more easily obtained in most localities. The thickness ought not to be less than two inches.

Finishing the Work.

At the front the top may project say an inch and a half to cover the edge of an "apron" or board about 1¼ inches thick bolted or screwed to the legs. This greatly stiffens the whole bench, though if it is desired to put in drawers, the apron may be dispensed with and some other means of stiffening adopted, such as diagonals. A similar board at the back ought to project perhaps four inches above the top of the bench to act as a stop to prevent tools and other articles from rolling off onto the floor. The planks forming the bench top must be well seasoned before being put in place and must be drawn very close together. Otherwise the joints are likely to open up as the wood dries out, and such cracks are a continual nuisance. If they occur they ought to be filled with soft wood strips slightly tapered so they can be driven in, like very wide wedges, until flush.



Make It Immovable.

The bench is all finished and the vise or vises in place. One of the men wants to put a slight bend in a piece of pipe. He puts the pipe in the vise, inserts a piece of round steel in the pipe, grasps it firmly in both hands and gives a powerful heave. Over comes the bench, spilling all sorts of small articles all over the floor so that the workman has to use up a lot of good time picking up again and getting ready for a new start. Then he has to figure out how he can put pressure on his pipe without overturning his insecure bench, and the job, all told, takes him about three times as long as it ought to take.

A bench for heavy work ought to be so secured that it is as firm as the shop itself. The legs ought to be secured to the floor with angle-pieces and bolts or lag-screws, but this is not by any means enough; the back of the bench ought to be bolted to the wall with good big bolts, expansion bolts, or lag-screws. The construction of the shop itself and of the bench will have to determine the exact method of fastening made use of. The object is to have the bench so solid, in itself and in its holding down, that no pressure a man can put on it will move or rack it and no weight that can be put on it will spring it or strain it in the slightest.

Bench Requires Attention.

Once a good bench has been made and placed, it is worth taking some care of. Unavoidably a bench will in time get more or less hacked and "chawed up," but this can be and ought to be limited as much as possible. We all know that the old-fashioned shop of the average kind did not care a scintilla what happened to a bench once it was put into service; but there is no reason why that idea should be perpetuated. If an engine, for instance, is to be placed on the bench it should be put on blocks, and the same precaution ought to be taken with other heavy things. There are many other ways of keeping old age away from a bench, but one example is as good as another for conveying an idea

A Good Vise, One With Swivel Base, as Shown at A, Is Superior to the Immovable Type.—The Ball and Socket Type, B, Permits of Turning Work to Any Angle.

that the average man ought to be bright enough to grasp at once.

Places for All Things.

Going back to the matter of putting an engine, for instance, on the bench, there are many very

Digitized by Google

fine reasons why it should not be done. It is inconvenient for the workmen, it is not conducive to good work because it is hard to get at anything but one side or end, etc. In some cases possibly it may be impossible to avoid putting engines on the bench; but in most cases it will be every bit as easy to arrange to put the engine in a specially constructed horse or stand, concerning which we will have more to say a little later along. This makes more trouble at the start-out perhaps, and it may occasion a little head-scratching in case there is not much room for things; but it is difficult to think up a case where it would not be amply worth all the trouble. The same holds true of rear axle assemblies and the larger transmission cases, though small transmissions, front axles and most other car parts are less worrisome.

Best Material to Use.

Reverting for an instant to the construction of the top of the bench, it may be that local conditions make it difficult to obtain hardwood planking of the proper thickness. In this case it is permissible to make the bench top in two layers, the lower one 1¼ inch or 1½ inch pine, cypress or whatever wood is handy, and the top of inch hardwood, or whatever thickness is obtainable. The softer woods, especially cypress, are likely to shrink more than hard wood, and for this reason the fastenings for the hardwood top ought to run clear through the soft wood to the bench framing, the holes in the soft wood being large so that the boards can shrink independently.

It may be well just here to reiterate what was stated in the first of this series; that this series is not intended for the experienced, but for those who want elementary information and have looked for it in vain elsewhere. It is the fashion to assume that everyone knows certain things and to pass them over in an off-hand way, when in truth these are the very matters that require explanation. The real beginner doesn't know where to begin and you, Mr. Experienced Man, will find it very hard to tell him where to go for a start except to the School of Experience, which is a school that involves the expenditure of a great amount of time, and these are days of short cuts and of efficiency. So we will go ahead with our plan of starting at the bottom and assuming that the reader doesn't know a thing but wants to. And if that same reader should want to know something that he does not find, let him speak up and ask. He will be answered, and that as many times as he pleases to ask.

Picking Out a Vise.

Every time an old hand in the game comes to speak of a tool, no matter what that tool may be, he feels impelled to say "If there's any tool on which it's expensive to economize in first cost, it's this one!" And just about every time he will be right. It is one thing to buy a tool for use "around the house" or something like that, but a different matter when it comes to buying tools for constant use every day under conditions such that the failure of the tool means actual loss of money.

That brings us to the vise, and if there's any tool on which it's expensive to economize in first cost it's a vise! It is doubtful if there is anything in the whole shop that gets the manhandling that the vise gets, and even though vises are built to stand such service, it takes a good one to stay in the game and maintain its efficiency year after year. There are many good vises on the market and some that are anything but good; but it is perfectly safe to invest in a vise with a well-known name back of it. In the absence of experience, that is the proper course and the only safe course.

Best Vise the Cheapest.

As to price, there is really very little difference, all things being considered. For a vise of a given size, weight, type and quality the price will run about the same in all makes. When a substantially higher price is asked it is almost invariably because there is some extra or exclusive feature, a higher grade of material or something else that makes the tool worth the extra money to the man who can use the features that the extra money pays for. It is impossible for a very cheap vise to be as well and of as good material as a vise selling for a comparatively high price; not only does steel cost more than cast iron, but it costs more to work it. On the other hand, it is impossible to sell an inferior vise at the price of a good one. Competition is too keen. So when you buy a well-known vise from a reputable dealer you can be confident that you are getting your money's worth, whatever you pay.

Whether the vise is just what you need in your own business, however, is another matter, though any of the vises commonly known as machinists' vises are suitable for automobile repair service. They are all of the "parallel" type, which means that the jaws are at all times parallel, no matter how far apart they may be, as distinguished from the jaws of the blacksmith's vise, in which the outer jaw is pivoted and so its face, as it swings out on the pivot in widening the opening, forms an always increasing angle with the inner jaw, which does not move. This type of vise is not suitable for automobile repair work and therefore will not be given further consideration.

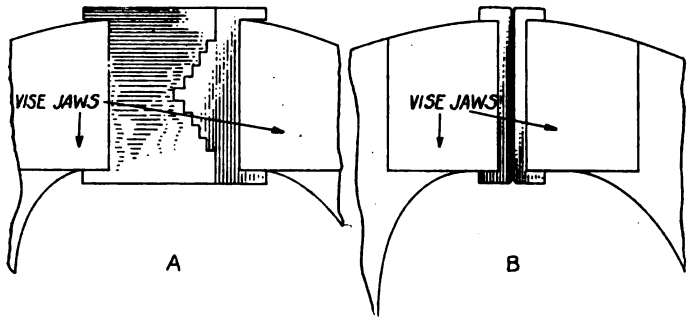
Conveniences in Vises.

The good machinist's vise begins with just the plain tool immovably bolted to the bench, with plain screw movement of the sliding jaw and both jaws faced with hardened steel. Upon this foundation many improvements have been built. In the first place, the vise, instead of being immovably secured to the bench, may be had with a swivel base, the base being fast to the bench and the vise arranged to turn at any angle, being held where desired by a screw or cam of some kind. This is a very great convenience, and though it adds 20 per cent, more or less, to the price of the vise, it is worth it, as the user will quickly discover, or as any experienced machinist or mechanic will testify.

An improvement that is a time-saver is the rapid adjustment feature. The object of this is to save as much as possible of the time lost in moving the jaw in or out. The movement of the screw is somewhat slow and tedious when the vise is opened wide or closed up again. There are several methods of working the quick adjustment. In one there is no screw, the slide working in and out freely until a convenient lever is pulled, which engages a rack in the slide and applies ample pressure after the jaws have been brought together upon the object to be held.

In another type there is a screw and a sectional nut, the nut clamping on the screw when the jaws

Digitized by Google



have been slid into place. There are others too. For general work it may be said that it is not invariably desirable to have this quick action. Often it is highly desirable that the vise should be used as a sort of press, in which case the continuous screw arrangement is the best possible.

Removable Facings.

It is now quite an ordinary matter for the jaws to have removable steel facings, for two reasons. One is that the steel facing, getting the brunt of the wear and tear, will need replacement before the rest of the vise is worn out, and a removable facing is easily replaced. Another, less common, is that in some cases jaw faces of different shapes can be used, odd-shaped pieces thus being more easily held. A variation of this plan is to make one of the jaws so that it will swivel horizontally, with provision for holding it in any position, which works very well indeed. One type of vise has, instead of the swivel base, a big ball-and-socket joint, so that the vise can be turned to any angle, any position at all. This is like some other things; it is exceedingly useful in some cases and no use at all in others; in general work it has little or no advantage over the plain swivel base vise.

Convenient for Handling Pipe.

Almost any machinist's vise can be had with attachments which make it very good pipe vise, and

Useful Vise Attachments: A, Pipe Holding Jaws for Securing Tubes, Etc.; B, Caps or Fittings for Holding Brass, Copper or Aluminum Parts.

this is a very good thing in automobile work, where there are many pipe jobs and many round rods to be worked on. Without doubt the most convenient arrangement is to have a regular pipe vise, and a shop of any size will actually find such a tool a necessity; but for the small shop just beginning life a pipe vise attachment for a machinist's vise will answer all purposes and give great satisfaction.

Types Required.

Now for a little practical talk on the actual selection of a vise, now that we have gone over a few, though by no means all, of the features of modern vises. There is nothing worse than to go to work with a vise that is too small and a vise, like any other tool, will fall down sooner or later under abuse. But too big a vise is very clumsy in doing small work. What are we going to do? The answer is that if possible it is much better to have at least two vises, one a big, heavy one with 5½ or 6-inch jaws, which will defy almost anything a man can do to it, and the other smaller, with say 3½-inch jaws. The last, while a good, husky vise, will not be too heavy and slow for moderate sized work.

And let us hasten to add that there really ought to be a very small vise, one of the kind that can be bought for a couple of dollars, for holding small light parts, such as carburetor, magneto and other comparatively delicate parts. It will be found advisable to have both larger vises of the swivel base type, and it will also be found advisable to have pipe-holding jaws for both. The reason for this last is a good one.

Need of Big Vise.

The large capacity of the heavy vise is handy for taking in big rear axle tubes, for instance, which would overtax the small tool, and the workman would feel secure and safe in putting on all the pressure the job might require. But when it comes to holding something like a pump shaft, or small pipe, the big tool would be in the way and unnecessarily bulky, which would results in loss of time. In fact, sometimes it is not possible to do a small job in the big vise or a big one on the small vise. And there you are! If it is absolutely necessary to get along with one vise a compromise can be made on one with say a 4-inch or 4½-inch jaw. It is a small shop indeed, however, that will not need two vises during the busy season.

The steel facings of a vise are necessarily hard, and they are scored or roughened to give them a firm grip. This is hard on a finished metal surface, and yet finished parts often must be firmly held. For this purpose it is customary to fit over the jaws shields of softer metal, such as brass, copper or lead. Even hardwood strips may often be used to advantage, especially in holding brass, copper or aluminum finished parts. Brass or copper vise caps are much cheaper to make than to buy, generally.

Making Vise Caps.

To make a pair of caps, take two pieces of brass or copper, the latter is usually the softest, a trifle longer than the width of the jaws and about twice as wide as the depth of the gripping surface of the jaws. Clamp them in the vise so that the part gripped will just a little more than cover the steel facing separate, and bend the upper parts back and gently hammer them down over the tops of the jaws. Then heat them until they are a dark red and plunge them into cold water, which has the effect of softening them, the hammering and working tending to make them hard.

Be extra careful not to get too much heat if using brass; brass sometimes will almost fall to pieces when a little too hot. Just a good dark red is sufficient. The cooling in water is not absolutely necessary, the metal will be quite soft without it, but it helps some. It should be remembered that continual pressing or striking or bending brass or copper gives it a hard surface. This is easily proved by taking a piece of soft sheet brass or copper and hammering it lightly all over on both sides, when the metal will be found to be quite springy, and if the process is continued in the proper way a very good spring can be made. This is the principle used in making spring-tempered brass and copper, the working being done by rolling the sheets under very heavy pressure.

Caps Will Harden.

After the vise caps have been in use for a time, bearing the foregoing in mind, it is readily understood that they become hard on the surfaces and require annealing by heating and cooling. Another thing to consider is that the soft metal picks up

Digitized by Google

and holds particles of harder metal, such as filings, chips, etc., these being embedded and perhaps scratching the finished work when pressure is applied to the vise. Dressing up the caps, smoothing their faces and annealing will dislodge most of these.

Lead caps for very fine surfaces are made in the same way from sheet lead, but should be rather thick—say not less than 3/16 inch or, better yet, ¼ inch. The lead does not harden in use like brass or copper, but it picks up hard particles much more easily and for this reason care should be taken to see that they are kept clean, and when a nice piece of metal is to be gripped between them they should be examined to see that they are free from foreign metal.

Installation of Vises.

The first thing to bear in mind when installing vises is that they may be called upon to hold pieces that may extend a considerable distance in either direction. Therefore as much room as possible should be provided. Bolts used for holding down the bases should be as large as the holes will take. The best place for a vise is close to a bench leg, so that there will be good solid support under it. The advantage of this is especially noticeable when doing anything requiring heavy hammering—heavy chipping, for instance. The feeling of a springy bench at such a time is extremely unpleasant to the workman and reduces the efficiency of his tools appreciably.

How to Locate Pipe Vise.

If a pipe vise is included in the equipment of the shop it should be placed where there is plenty of room on both sides of it so that long pieces can be readily gotten in and out. Don't forget that a shop that starts out to do automobile work can do other work as well, and there is no reason why the profit on a bit of pipe-fitting or anything of the kind should be turned down. Therefore in putting in tools bear in mind that there are other things in the world besides automobiles. A good stout pillar is a good place for a pipe vise, which can be set with its base vertical instead of horizontal if necessary.

Ed. Note.—This is the second of a series of articles by Mr. Mann dealing with the equipment, operation and maintenance of the repair shop. The third article will appear in an early issue.

DODGING THE BUMPS.

Why Some Drivers Obtain Good Car Service Without Big Depreciation.

BY JAMES F. HOBART, M. E.

The writer recently stood for a considerable length of time on a street crossing and watched carefully to see how some car drivers "bumped the bumps" while other drivers seemed to avoid all the rough places, or at least they dodged the bumps almost completely.

After considerable watching, it was seen that some men seemed to know just where each bump and rough spot was located, and this, too, when the driver chanced to be a perfect stranger in town, perhaps having never driven a car over that crossing before.

Some street crossings are nasty spots to negotiate and when such crossing also contain branching-off street car tracks then it is much harder to drive a car across without receiving a shaking up. By watching several drivers as they came, both the "bump" and the "non-bump" ones, it was seen that the men who escaped a shaking were keeping close watch of the trolley wires, any branching of which could easily be seen for some distance. By thus watching the wires the driver was enabled to cut down speed still more when car track crossings were to be taken. The careful drivers also slowed down at each and every street intersection, so as to have the car under complete control and were thus able to dodge any rough spots, water-sheds, etc., which might be present.

Critical Car Speed.

The writer has long noticed that of many makes of cars passing over the same rough collection of "bumps," all cars do not vibrate alike when making such passage. This is not only possible but an actual fact. The scientist will tell anybody and everybody that anything and everything at any time and all the time is in a state of continual vibration, and that anything and everything has a certain rate of vibration whereat it shows up at its best, be it light, man, tree, trolley car or automobile. Therefore, it is to be expected that when a car is driven over a rough bit of road it will vibrate considerably. But, Mr. Car Driver, haven't you found that any car, traveling over rough roads at various speeds, will seem to pass over easier and smoother at a certain speed than it will pass at any other speed either faster or slower?

The writer has had that experience and there seems to be a certain speed in miles per hour, at which a car will run much more smoothly over rough roads than it will run at any other speed. Some of the drivers who passed the "bump corner" were evidently well aware of this speed fact other drivers seemed to know nothing about it.

Nevertheless, the easy riding critical speed of one car is seldom like that of any other car. Each driver must find out for himself the particular speed at which his car will negotiate most smoothly a rough piece of road, and it is suggested that the manufacturer of each car do some experimenting in that direction so as to advise purchasers of the particular speed at which the car will take rough roads with the least vibration.

It would seem at first sight as though the slower the car runs over rough roads the smoother it will ride. Probably this is true to a certain extent. But the point which the writer wishes to bring out is that somewhere between 10 and 30 miles per hour, any car will ride smoother over rough roads than at any other speed, above or below, and that this critical speed should be sought for, found and used upon rough roads.

Should a car be found to run smoother at 20 miles an hour than at 12, then by all means use the 20 mile rate in passing rough crossings. It will of course be harder upon springs and tires but the engine will be saved from that much vibration and will last longer as will the rest of the vehicle superstructure.

Need for a Standard System for Recording Truck Operating Costs

* BY S. V. NORTON

Perhaps one of the most urgent needs of the motor truck industry today is for a standard system of keeping track of truck operating costs. A large number of truck operators are either not making or not saving the money they should from their trucks. Many of them are actually losing money. Why is this? Simply because truck owners have been too busy delivering their goods to ask themselves, first, "What does it actually cost?" and second, "What ought it to cost?"

With the necessity for war time economics the need for keeping track of motor truck costs is more urgent than ever. In the past many cost systems have been devised and distributed to motor truck owners and while these systems were generally compiled by experts and were complete, they were not uniform and different systems treated various items of expense in different ways.

Standard System Needed.

A standard system setting down a uniform method of figuring truck costs would provide a common language by which the experience of all truck operators in the country could be related and understood.

It would unlock a great storehouse of information which is at present closed to the truck owner.

Any individual system, however well designed, cannot serve the motor truck industry adequately so long as several other cost systems, which also may be well designed, are in existence. The difficulty comes from a lack of uniformity in the treatment of various items of expense. Truck owners who use systems which have been compiled by authorities on motor truck accounting or by general expert accountants, and which are generally complete, show results which are not subject to comparison because of varying methods of computing identical items. There are, for instance, at least four methods of figuring depreciation.

Cost Data Varies.

Two truck operators, A and B, use systems devised by competent accountants, A's cost system provides that depreciation shall be figured at 20 per cent. a year, charging off the entire cost at the end of five years, but B's system declares that depreciation must be figured on a mileage basis, allotting 80,000 miles as the expected life of the truck. Both operators use cost systems devised by experts, yet the difference in computing this one item alone may amount to $100 or $200 a year.

If all or even the great majority of truck owners began to figure depreciation according to the standard formula, an enormous gain would be accomplished, for a common denominator would be established by which one truck could be compared with a thousand trucks in respect to this item.

Factors in Cost System.

A well conceived motor truck cost system should reveal:

Number of trips and customers or deliveries.
Total and average loads in units.
Round trip distance and total miles traveled.
Unit-miles.
Miles per gallon of gasoline and of oil.
Standing time at plant in hours and minutes.
Running time in hours and minutes (including stops).
Average loading time per trip.
Average speed in miles per hour.
Estimated running time per mile.
Estimated time per customer's stop (in minutes).
Cost per day (at work).
Cost per mile.
Cost per mile and per unit.
Cost per unit mile.

Now suppose a standard system were adopted and widely used which would enable a great many truck operators to compute these items in the same way. The benefits to truck users would be enormous. A comparison of figures would bring to light many possibilities of economy, as well as many causes of waste. Expensive methods would have to go, time-saving and money-saving ideas would spread throughout the truck using public.

Tire Records.

Take the matter of supplies. A great deal of doubt exists today in the minds of truck owners as to which oil, which tires. which accessories of all kinds are the best. Many owners admit there seems to be no way of finding out. Suppose now that a considerable number of truck owners kept their tire costs in the same way.

The reports from dozens, perhaps hundreds of truck owners, rendered in a uniform way, would tell a convincing story. They would establish proof where heretofore there was guess work.

Repairs and Maintenance.

Consider the matter of maintenance or repair. Every reputable truck maker is searching constantly for information which will enable him to perfect his product. The world is his laboratory, and he would like nothing better than to receive reports from all his customers which would describe the shortcomings and lay bare the weak points of his truck. Unfortunately this information is not yet available to him, except in fragmentary form. And even in those rare cases where he does receive the complete history of an installation, the story is apt to be, as it were, in a foreign language, which must be translated or interpreted before it can be of use. The same may be said of the maker of parts.

What former attempts to establish a standard cost system have lacked, seems to be abundantly supplied in the movement now well under way by the Truck Owners Conference, Inc., at Chicago. It is hoped that this movement will result in a cost system being approved which may fully take the title of a standard system. The movement is by far the most encouraging sign of action toward this end that the industry has yet seen, and as such deserves the support of every truck owner, manufacturer and maker of truck parts.

Cutting Down Expenses Without Handicapping the Growing Business

Analyzing the Various Items Which Go to Make Up the Disbursement Columns of the Ledger and Considering Those Which Cannot Be Cut

BY FRANK A. FARRINGTON

How can I reduce expenses? That is always a practical question, and it has a special fitness at this time when the tendency is for expenses to increase steadily. The cost of doing business continues to go higher until it looks as if it would soar above Gilderoy's famous kite. And just at this time when our business needs more money, the Government wants more of our financial help and we want to give it, but if we contribute more to the support of the war, we have to get that money from some source, so it looks as if it would be necessary for us to cut operating costs to the bone.

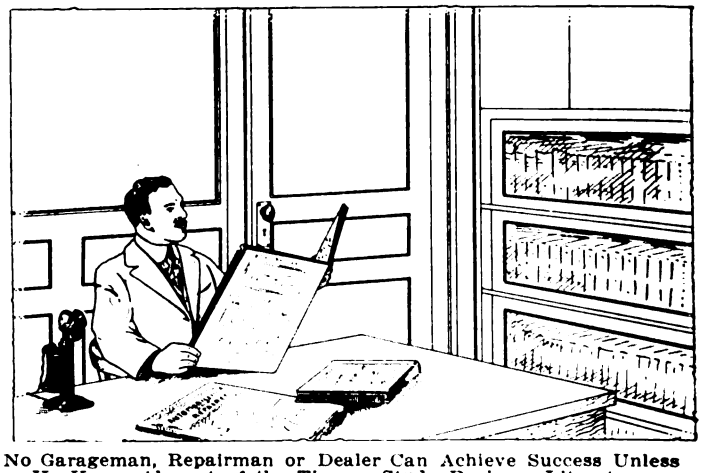
Cutting the Advertising Appropriation in Two Is Mighty Poor Economy.

Where to Cut.

The question is where to cut. We have to bear in mind that there are many expenses that cannot safely be cut. Take advertising, for example. The dealer who is doing considerable advertising finds that it runs up into money pretty fast. When he looks over the expense items to see which ones can be cut, he sees this advertising expense sticking up above the rest and he does not see immediate cash returns from it. It looks as if he could stop advertising for a few months without losing anything, because, as he reasons, "Everybody knows where my garage is." So he lops off the advertising expense and thinks he has saved a lot of money. He does not realize differently for a few weeks, and he may even lack the perception to see that the fact that his business is so much less this summer is due to the absence of advertising.

Advertising Is Necessary.

Advertising is a good example of a class of expense that cannot be spared. If you want to save money on advertising, the way to do it is not by ceasing to advertise, but by advertising more efficiently and more economically. At such times as this, you should do more advertising rather than less. It is more and better advertising that is going to keep your business up and enable you to take in more money with less running expenses, or without increasing costs.



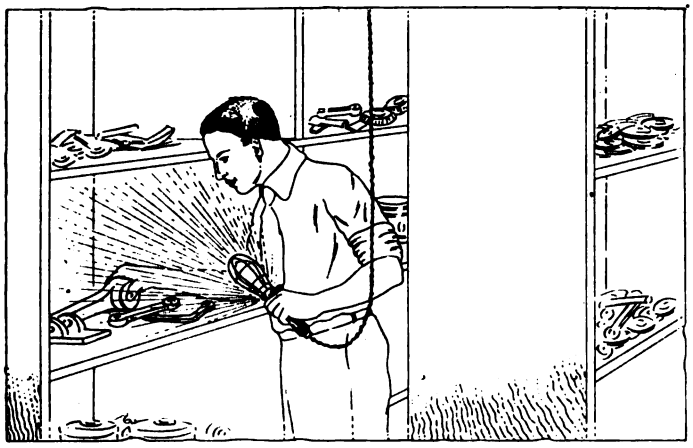
Run Good Copy.

Use more care in selecting your advertising medium. Get better position in the local paper and see that they keep you in that same position each issue, and instead of running the same advertisement week after week, put in a new one every time. People are not going to read old advertisements when they would scorn to read the same news items or stories a second time. Do you think your advertisements are so much better worth reading that people will enjoy repeating the reading? Yes, I know, there is that argument that people who do not see the advertisement the first time may see it the second time, but those people would see the different advertisement just as well. Spend more time, too, in preparing your advertisement. Get up the very best copy you can make. It costs you just as much to run a poor advertisement as it costs to run a good one.

Keep Signs, Etc., Clean.

Take advantage of all the help the manufacturer is prepared to give you in the way of advertising matter for the things you sell. This advertising matter is free and it will pay you well for its distribution, which will cost little or nothing. Use the good signs and show cards that are sent you. Take pains to put them up well where they will show and when they get soiled, take them down and put up fresh ones.

Without going any farther into the matter of saving money on advertising, it ought to be plain that it can be done without reducing the amount or the effectiveness of the advertisements. Just use more care, more intelligence, more pains.



No Garageman, Repairman or Dealer Can Achieve Success Unless He Keeps Abreast of the Times.—Study Business Literature and Read The Automobile Dealer and Repairer.

You cannot get along without heat and light any more than without advertising, and if you are to

Digitized by Google

create a good impression, you do not want to skimp on these items any more than the proper conservation of fuel demands. Just as in advertising, the way to save along these lines is by efficiency rather

Dark and Poorly Arranged Stock and Store Rooms Means a Loss of Time and Money.—Stock Room Mistakes Are Costly.

than by main force. Instead of trying to get along without enough heat or light, see how you can develop the amount you need with the least possible expense.

Heat vs. Waste.

Enough has been said by the Government officials about efficient use of coal and heat so that further suggestions ought to be unnecessary. We all ought to have sense enough to see that heat is not wasted by needlessly open doors and windows, by heating a room we do not need to use, by keeping the garage at too high a temperature, by running up steam and getting things too hot so they have to be cooled off by opening the doors. Efficient heating methods will make it possible for everybody to have all the heat necessary. It is the waste of heat and fuel that makes the trouble.

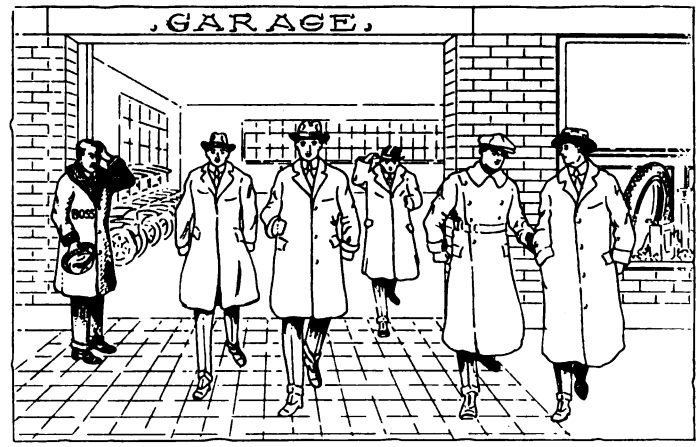
Economical Lighting.

It is just the same with light. Wasted light counts nowhere except on the debit side of the ledger. Light in places where it is not needed, too much light in some places and not enough in others, old incandescents where modern tungstens should be used, tungstens that have been used until they do not return as much light as they consume current, lights left going in cellar or stock room or elsewhere where used only occasionally, windows where the lights throw all the illumination out on the street instead of illuminating what is displayed in the window; all these count for needless expense that can be reduced or eliminated with little trouble.

So much for light and heat, and at the best I can only hope to set you thinking so you will go around and investigate once in a while conditions that may be left too much to employees whose intentions are good but who are more or less careless.

Employees and the War.

We are all going to continue to lose employees as more men are called to the colors. This may bring about temporary reductions of the payroll, but that will not necessarily mean reductions in expenses. If the same work is to be done with less men, those men will have to work harder and if they are good men, they will be willing to put in overtime and they ought to be properly paid for it, but in order to reduce costs, there should be watchfulness to see that the employees are inspired with a desire to accomplish something rather than merely to put in time.



It will reduce expenses to get your men more interested in the business so they will want to be efficient and the same result will be accomplished by getting them interested in their own success instead of merely in their pay envelopes. A profit-sharing plan based on giving employees a percentage of the gain in the business or in the increase in net profits, will get the employee and the cash register tied up together.

The One and Two Man Job.

In plenty of shops there is idle time due to one man working at a two man job or two men working at a one man job. It is because of his ability to prevent waste time that a boss earns his pay in handling a gang of men. You may not have a big enough business to employ a regular shop boss, but you can yourself watch the laying out of jobs, or make one man superintendent and thus keep work planned in advance so there will be no waits between jobs and no time spent in discussing what to do next or how to do it, and no instances where one man thinks it is easier to have a helper for certain parts of his work and so keeps one around him when useful only half time.

The shop where slack methods prevail, and there are many of them, follow those methods only because the head of the concern has not developed a system that eliminates them. It is scarcely to be expected that the workmen will develop their own systems, no matter how good men they may be. A good man will leave a shop where inefficiency prevails. If your shop is run the wrong way, you may be sure it will have the wrong kind of men in it. No other kind will stay.

The care used in arranging the work in a garage will be the means of making many a job profitable or unprofitable. To follow absolutely the order in which the work comes in may seem the desirable thing, but it may mean two jobs calling for the same machinery or tools at the same time and it may mean men standing around waiting. The work must be so ordered that there will be no waiting inside the shop, even

The Draft May Reduce the Working Force, But It Does Not Necessarily Mean Reduction in Expenses.—Watch the New Workmen to See They Produce Results.

if it means a little more waiting outside, on the part of the customer. A job that does not pay a profit is not worth much to you.

Wherever you can reduce the amount of labor

Digitized by Google

done by hand by the introduction of modern equipment or new machines, that offers a chance to reduce operating costs and to make it possible to get along with the less number of men available. A machine will do the work for less money than the man, so consider carefully whether there is not some way in which you can use more or better machines. Study the pages of your trade journal to find the advertisements of such mechanical helps as you might use. Write to manufacturers for information. Don't be afraid to take up by mail or with a salesman the consideration of installing some new machine. It is your business to find out all you can about every new labor-saving device in your line.

Doing business the way you always have done it and doing mechanical jobs the way you always have done them may give reasonable satisfaction to your patrons, but you want some satisfaction left for yourself, some pecuniary satisfaction in the form of a net profit from the business. The machinery of garage work is all the time being improved with a view to making it possible for the owner to compete on a profit basis with constantly growing competition in his own and other towns.

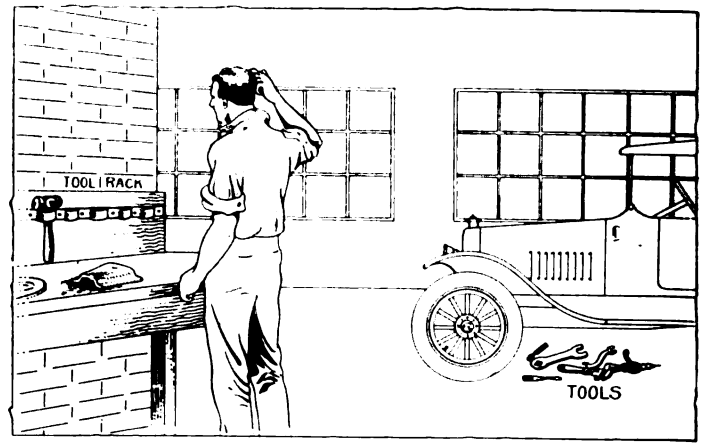
The efficient way of doing things will prove to be the cheapest way in the long run, so keep in touch with the latest improvements in mechanical methods, keeping your shop and your employes up to date.

Stock Room Mistakes.

Methods of storage have something to do with keeping down expenses. Some stock rooms, for instance, are veritable cubby holes in the dark corners of which repose stock long forgotten and duplicated and reduplicated in order after order. A stock room may have shelves or bins too large and deep for some of the kinds of stock kept there. A deep shelf permits some stock getting shoved back out of sight and more is ordered while plenty is still on hand. Darkness in the stock room is sure to cause patrons to be sent away empty handed when the parts are right there, but out of sight. A few good lights put where they will light up the dark corners will help the stock room question a good deal. Economy requires the careful use of such lights and that they be not left turned on, but it requires their presence.

If I had to get along with a dim light in the office or in the stock room, I think I'd take it in the office. There I would at least concentrate what light I had where I needed it. Stock room mistakes cost more than office mistakes, because they do not get found out and corrected. Dark corners anywhere work is done or supplies kept are sure to create expense.

In addition to light in the stock room, there should be system there, of course, a place for everything and that place clearly indicated so the right thing can be found in the least possible time. If a man who is drawing five dollars a day has to spend 15 minutes looking for something he ought to have found in one or two minutes, you can figure out for yourself how much it has cost you to lack system in that case.



Value of System.

It is the same way with tools. If the tools all have their places where they are returned after use, there is much less likelihood of their disappearing, to say nothing of the advantage of being able to get the thing wanted without having to go around and look for it under every car in the shop. System, which is nothing more than order, will help cut down expenses. Lack of system can be counted on to boost expenses.

It ought not to be necessary to call attention to the fact that taking proper care of equipment makes it last longer and cost less in the long run. You condemn the motorist who brings in a car which has been neglected and not overhauled in an undue length of time, but are you as careful as you ought to be about overhauling your own machines and keeping everything working at its best and neither abusing nor neglecting? If you are not, you can find in that fact a cause of needless depreciation—and depreciation is expense.

Look Up Customer's Credit.

Then there is the matter of accounts. Accounts lost are money lost, and it comes out of the profits—goes into the expenses. It is a safe bet that you can reduce the number of your uncollectible accounts by using more care in your risks. You don't have to trust everybody who asks for credit, even if the car is repaired and they are ready to take it away. You ought to hang on the wall above your desk the motto, "Learn to say 'NO'" and you ought to keep one eye on that when Mr. Slowpay tries to get away with $100 worth of work and material without putting down a cent of money.

When a Workman Has to Hunt for Tools He Is Wasting Time and Money.—Lack of System in the Repair Shop Boosts the Expenses.

When a car comes in for repairs you have time enough to find out about the credit rating of the owner, by asking the bank or somebody else. Don't take chances. Chances are what cause losses. Suppose the poor pay patron doesn't like to be refused credit, if you lose his business by refusing to trust him, you gain rather than lose by the means.

Get Your Money.

Then delay in collecting costs money. When a man owes you money, see that he is given early and frequent chances to settle. It's your money. You are entitled to it. If he gets mad, you have found him out at least.

This matter of cutting down expenses is a matter of all around efficiency. We have reached a point in garage management when the inefficient manager is not going to be able to continue in business as long as he once could. There may have been a

Digitized by Google

day when almost any mechanic could open a shop and manage to keep going and make a living. That day has passed. Today the garage manager who does not study efficiency in all departments will find himself crowded out of business.

What War Is Doing.

War has helped to make the more inevitable a condition that was on its way to us before—the survival of the fittest. The unfit business man is going to be crowded to the wall and nobody is going to be seriously to blame but himself.

Study the business literature and the automobile trade papers and the books that apply to your business just as a professional man studies the textbooks of his line of work. The more you learn about your business, the better able you will be to cut down expenses without causing a resultant cut in the receipts.

Developing Truck Efficiency.

In view of the shortage of gasoline in England and the necessity of relieving the traffic on railways, it has become necessary that all privately owned motor trucks and steam trucks should be utilized to their fullest carrying capacity, and accordingly the transport section of the Ministry of Munitions has arranged a scheme of mechanical transport control to cover the West Riding of Yorkshire. A public notice states that the object of the scheme is to provide loads for empty journeys that trucks are at present running and to provide loads for trucks not fully employed within a radius of about 20 miles of loading point.

The charge, which commences from the time the truck arrives for loading until it is released, ranges from 5s. ($1.22) per hour to 12s. ($2.92) per hour for gasoline trucks of 10 hundredweight up to five tons capacity, 9s. ($2.19) for rubber-tired steam trucks up to five tons capacity, and 6s. ($1.46) for steel-tired steam trucks of a similar capacity. Trailers will be 3s. (73 cents) per hour extra, and special rates can be arranged for regular journeys on long periods. Charges will be collected by the Ministry of Munitions, who accept responsibility to pay the owners, after deducting 5 per cent. from the amount received to cover expenses of administration, and traders within the prescribed radius who require to forward goods should supply full details of their traffic and the points between which it has to be conveyed.

Chambers of commerce and traders' associations in the area have undertaken to give the scheme all possible assistance; and at a recent meeting of the motor haulage contractors in the West Riding of Yorkshire they decided to accept the scheme, as it was felt that all traffic would soon gravitate into this official channel on account of the cheaper rates. It was also realized that as the supply of gasoline is controlled, and in the last resort the Ministry could utilize Army Service Corps wagons, the contractors could, by adopting the scheme, maintain their industry and stand in a better position to obtain supplies of fuel and machine parts.

Building Roads for Cars.

The use of motor cars in Hongkong is comparatively limited, but at present there may be said to be almost an automobile boom in the colony. The Colonial Government, recognizing the increased demand for automobile roads as a means of healthful recreation, and also as a means of opening up residential sections not now in use, has announced a comprehensive policy of road building and road improvement, which in fact already is under way. Several enterprises are on foot in the colony which demand increased and improved means of transportation to and from the outlying districts. The wealthier Chinese residents have taken to automobiling most enthusiastically, and are by far the best customers of the public garages. The use of automobiles by private owners also is generally on the increase.

During the past few months the number of cars in use has grown rapidly, there are more garages, and a good volume of orders has been placed. There are now licensed in the colony 125 motor cars and 118 motorcycles, compared with 105 cars and 91 motorcycles in December, 1916. A canvass of the dealers and garages indicates that between 25 and 30 new cars have been ordered, all from the United States. Most of them are popular-priced machines, but there is an increasing demand for the higher-grade ones. An order for 11 placed by one garage included five of high grade. In spite of excessive freight rates, the demand promises to continue for some time, although the market may easily be overstocked.

Alcohol for Engines.

The Commonwealth Advisory Council of Science and Industry of Australia has just published the report of its special committee on the question of alcohol fuel for engines. Gasoline sells out there at 65 cents a gallon. The committee took up the records of research on this problem and found that alcohol had been used with success for a number of years in Germany in specially designed engines. They report that any ordinary gasoline engine may be run on alcohol except at the start and that the consumption of alcohol in such engines is about 50 per cent. greater than that of gasoline per horse power developed. In specially designed alcohol engines the consumption of alcohol per horse power is not greater than that of gasoline. The changes needed in the design of an engine to use alcohol are:

Increased compression from about 75 lbs. to 180 lbs. per square inch, preheating of fuel, air, or mixture, and increase in area of fuel supply pipes.

In starting the carburetor must be preheated or an arrangement made for the use of a little gasoline. Exhaust gases preheat after the start. The committee decided to turn its attention to stationary engines rather than to motors for automobiles because of starting difficulties and the advantage, as demonstrated, that is found in slow speed engines with a long piston stroke. The successful alcohol engines in Germany were almost wholly of this type. The records available indicated that comparatively little work had been done on engines suitable for motor car engines.

The following yields are reported in gallons of alcohol per ton of raw material used: Corn 80-83; barley, 65-70; wheat, 80-85; potatoes, 15-24; beets, 12-16; apples, pears, apricots, and peaches, 9-14; gum tree 12; soft wood sawdust, 20; grapes, 18; molasses, 65-70.

A benzol-alcohol mixture was considered without recommendation.—The Little Journal.

Considering the Factors Making for Long Tire Life and Easy Riding

The Influence of Size, Type of Construction and Inflation Pressure—The Possibilities of Pneumatics With Large Cross Section

BY W. S. WOLFE

Perfect riding qualities would be experienced on an even, smooth roadbed under which conditions the tires and springs would not be brought into play. Conditions only approximate this at best so tires and springs are constantly acting to "iron out" the irregularities of the road, to decrease the vibration which is destructive to mechanical parts, and to relieve the discomfort of the passengers.

Road conditions vary from the roughest with chuck holes, ridges and bumps to the improved highways, which are the nearest perfect.

On the former only low speed is possible and the springs and tires are constantly in action; as we approach the latter high speeds are obtainable and the tires' function is to reduce the vibration to a minimum. So springs and tires necessarily work together as the following example shows.

Function of Springs.

The operation of a car equipped with pneumatic tires but with no springs on a bumpy unimproved road would result in great discomfort to the passengers. With such a car on an improved highway the passengers would hardly feel the small unequalities of the roadbed.

A car equipped with solid tires and well-designed springs would give good performance on the bumpy road, while on an improved highway at increased speeds the vibration would be great. The nearest approach to the ideal is a car with well designed springs and adequate sized pneumatic tires.

Types of Tires.

The two general and distinct types of tires on the market are solid and pneumatic. The solid tire has found its field in the motor truck, when the loads are heavy, the design substantial, and absolute dependability is necessary—all at a sacrifice of speed. Solid tires, since rubber is non-compressible, rely on this power to distort and regain original shape to absorb road shocks. The standard types of solid tires are built to obtain economy and endurance of the tire itself rather than cushioning qualities. The cushioning quality varies with the height of the tire and is gradually decreased as the tire wears down. It also depends upon the degree of softness of the compound used, but the amount of cushioning thus obtained is limited because below a certain point the life of a tire decreases rapidly with any increase in softness of the compound. With the same height of tire, added width results in an increase of the cushioning qualities.

The public has recognized the shortcomings of the standard solid tire and has had the "bugaboo" of flat pneumatic tires, so that cushion tires have come on the market with varying success. The essential features are a softer compound used in greater quantity, and designs with such unique features as air chambers, overhangs, and notches to allow greater distortion.

The pneumatic tire has already established itself on the passenger, motorcycle, bicycle and airplane. It has all but conquered on the light delivery vehicle, and the struggle for supremacy is about to start on heavy-duty trucks. The superiority is based not on lower cost per tire-mile, but on lower truck-mile operating cost; this is affected by increased speed, increased radius of operation, decreased fuel consumption, and by the decrease in upkeep and depreciation. The redesign of the truck, which is bound to come in order to reduce the weight of the carrier as compared with that of the load conveyed, will also be a factor in decreasing the operating cost.

Types of Pneumatics.

The pneumatic tire has three types, clincher, straight-side and quick-detachable clincher. Aside from the straight-side having a slight superiority because of increased air volume, the cushioning qualities are identical. Each type can be built in integral or two-cure construction without affecting the riding qualities.

Advantages of Cord Types.

The type of construction also aids in obtaining easy riding qualities. The standardized 17¼-ounce square-woven duck used for tire fabric is being replaced in the highest grade tires by a cord that varies in size from a two-ply cable to a multiple-ply cord built up in layers. The essential feature as regards cushioning qualities is that the tire with the cord construction resists bending to a much less degree and recovers itself more readily. At the same time less internal heat is generated and the power consumption is decreased. The fundamental principle is that a cord tire, because of its construction, can carry a given load with less air pressure and without fatigue or injury than can a fabric tire. A great gain in riding qualities results therefore from the use of cord tires.

Size and Inflation.

A far more important point to the easy riding and life of the tire is the tire size and inflation pressure. The proper tire to carry a given load is important to both car owner and manufacturer. As soon as the owner finds his tire service is poor because of overloading he puts more air in his tires to carry the load and thereby loses the qualities which give easy riding.

The inflation schedule, given in a paper delivered at the June, 1915, meeting of the Society, shows the amount of load and inflation under which a given size of tire works satisfactorily. For ideal performance the tire should be deflected from 10 to 12 per cent. of the sectional height. This gives the best combination of durability and riding qualities.

Riding and Service.

Let us take an example of good practice. If a 1,000-pound load is to be carried, a 4-inch tire at 80-pound pressure would give reasonable satisfaction, but would be hard and rebound at uneven places in the road. The owner, if not satisfied with

Digitized by Google

the riding qualities, might decrease the pressure and gain easy riding at the sacrifice of durability. The life of the tire is thus impaired. The most satisfactory answer is to use a 35 by 4½-inch tire and

PNEUMATIC TIRE SERVICE.
Five Major Troubles vs. The Operating Conditions

1. Tread rubber wear	each considered against	A. The load carried.
2. Separation between plies; and separation of tread from carcass		B. The inflation pressure.
3. Fabric breaks; and blow-outs		C. The speed.
4. Bead troubles		D. The spring suspension.
5. Tube troubles		E. The power of the engine.
		F. The condition of the road surfaces.
		G. The nature of the country.
		H. The weather.
		I. The temperament of the driver.

to decrease the pressure to 67 pounds. This gives the proper 10 to 12 per cent. deflection, and the tire is good for long service. The riding qualities have been wonderfully increased, because the tire at the reduced air pressure is flexible and adjusts itself to the unevenness of the road, thus transmitting none of the vibrations.

Oversize and Overloading.

It is to the advantage of car manufacturers to equip as nearly as possible their cars with tires conforming to the sizes given in the table, or the car will enjoy the reputation of hard riding or that of a tire hog as the case may be. Overloading on original equipment has been practiced to a considerable extent, but manufacturers are more and more beginning to appreciate the evil results. It is unfair to the car owner if the manufacturer uses an oversize tire as original equipment and does not leave any alternative in case the owner wishes to use larger tires without changing the rim and wheel equipment.

The inflation schedule, given in a paper by P. W. Litchfield, dealt with easy riding of tires, life and durability. He has made the tire oversize to such an extent that the actual section is from ¼ to ⅜ inch greater than the nominal. He gains the effect of an oversize and thus allows the use of lower air pressures, the recommended decrease being 10 per cent. To this oversize feature a great deal of the easy riding and endurance of the cord tire can be attributed.

The tire's overall diameter affects the riding qualities only slightly, but it is noticeable that as the roads improve the diameter decreases. This is

INFLATION AND LOAD TABLE FOR PNEUMATIC TIRES.

Inflation Pressure	Section Diameter of Tires, Inches											
	3	3½	4	4½	5	5½	6	7	8	9	10	12

shown by the fact that English and French tires are made in small diameters owing to the better highways.

The following is an extract from an article by P. W. Litchfield on History's Lesson to the Motor Truck, which appeared in the "Scientific American," and states clearly the reason for mounting heavy loads on air.

Success Due to Pneumatics.

"With steel tires the bicycle made but slow progress; the adoption of the solid rubber tire gave it increased public usage, but the pneumatic tire made it a big industry. The use of the solid tire on carriages increased the comfort of riding, but the pneumatic tire allowed the carriage to go so fast with comfort and safety that the horse was outgrown and became too slow, the result being the substitution of the engine.

"The automobile was made possible by the pneumatic tire. The internal combustion engine is a delicate mechanism. It has to be geared to the wheels in some form, hence the necessity of a perfect road, or of absorbing the shocks before they reach the wheels. The pneumatic-tired automobile

ANALYSIS OF CAUSES OF PNEUMATIC TIRE TROUBLES.

1. Unsatisfactory tread wear.	caused by	Wheels out of alignment
		Poor road surface conditions
		Too much power
		Improper use of brakes
		Disintegration from oil
		Skidding
		Under inflation
		Cutting of tread rubber by sharp stones
2. Separation between the plies of fabric; and separation of the tread from the carcass.	caused by	Riding flat
		Riding under inflated
		Punishment on rough roads
		Riding on car tracks
		Water soaked
		Overloading
		Heating from speeding
		Started by cuts
3. Fabric breaks; and carcass blow-outs.	caused by	Overload
		Under-inflation
		Stone bruise
		Flexing of the carcass fabric (after long service)
4. Bead troubles.	caused by	Under-inflation
		Overloading
		Bent rims
		Injured in applying
		Riding flat
5. Tube troubles	caused by	Leaky valves
		Pinched tubes
		Punctures
		Riding flat
		Heating from speeding

replaced the horse-drawn carriage, because it saved time, went farther and faster. It increased the amount of travel and increased the distance traveled. Statistics show that now, after the few years of their existence, automobiles are covering as many passenger miles as the railroads; not that the railroads have suffered any great loss of business, but that the increase has been created and absorbed largely by the automobile.

Developing the Truck.

"Following the passenger car came the light delivery truck, this replacing the horse-drawn truck, largely on pneumatic tires. Then we find the motor truck used in larger and heavier fields, still making an attempt to replace only the horse, and equipped with solid rubber tires, which had been practically abandoned on every other form of motor vehicle almost immediately after their adoption. Evidently the tiremaker had not kept pace with the development of the truck or the truck builder was making a mistake. Up to now the former is probably the case.

Cushion and Traction.

"It has long been known to the tire maker that compressed air with a durable container is the most

Digitized by Google

efficient cushion and traction shoe for the wheels of an automobile. Also, that the load and cushioning quality depend merely on the volume and pressure, and if great enough, there is little fatigue and wear to a properly designed tire casing. The manufacturer of practical commercial pneumatic tires jumped from the 1½-inch bicycle tire to the 4½-inch automobile tire in a year or two, and the latter has been the maximum size up to the present time. The resistance of close woven fabric to taking the form of a doughnut, its inability to stand the flexing and traction of greater loads, and the greater stretching and crimping given it in the larger sizes, seemed to establish the 4½-inch size as the limit.

Future Tire Sizes.

"The progress of tire design during the last two years has shown that this limit no longer stands if, instead of woven fabric, laminated cords without cross-weave are used. These cords take the strains without undue fatigue, and we now see our way clear to pass from 4½-inch cross section to 12-inch cross section as easily as we went from 1½-inch to 4½-inch. It is only a question of study to perfect the large pneumatics so that the truck can repeat the remarkable growth of the passenger car. Pneumatic tires up to 9-inch cross section are now in successful commercial use on trucks and passenger buses. The speed of and the distance traveled by these vehicles have been increased and the upkeep costs reduced. The tire cost per mile may be higher than with solid tires, but this same is also true of passenger cars. A solid tired touring car would have a tire mile cost of less than half of one with pneumatics, but all other costs—fuel, upkeep and depreciation—would be higher.

"The first trucks designed for solid tires were lighter than those in use today, but the vibration caused so much breaking of parts that they have been strengthened and reinforced repeatedly. This can all be saved by using pneumatics, permitting lighter chassis and bodies to carry heavier loads. Also the traction of large single pneumatics is much greater than that of solids, so that the trucks can be operated in sand, mud and snow, where the solid tired trucks would be stalled. The gasoline and oil consumption is much less when pneumatic tires are used.

Greater Speed Possible.

"The motor truck so far has only attempted to replace the horse in hauling merchandise because the solid tire has so limited its speed that it could not compete with any form of transportation requiring long hauls at higher speeds. When it can accomplish this, it so enlarges its speeds. When it can accomplish this, it so enlarges its field that it becomes a real competitor of the railroads."

*Paper read before the Pennsylvania section of the S. A. E.

Will Omit License Fees.

Wisconsin believes in encouraging the driving of automobiles and commercial cars over the road instead of contributing to the freight congestion now prevailing. Dealers, etc., driving cars from the factories and over the highways of the state will not be obliged to take out a license; that is, if the bill granting this privilege passes the legislature.

What's In a Name?

It is interesting to note the circumstances responsible for the adoption of many of the most popular and best known names of cars abroad. Putting aside the cars which bear the names of their makers, there must have been special reasons for the adoption of such titles as Sunbeam, Rover, Phoenix, Peerless, Moon, Simplex, Lorraine-Dietrich, Argyll, etc.

The combination of initials, which form a word, is very common with the Italian makers, for example, F. I. A. T., S. P. A., S. C. A. T., etc. When the F. I. A. T. company was formed it was decided to adopt a title which would fully explain the nature of the business and the location of the firm, and at the same time to get such a combination of initials as would form a readily-remembered word. The best combination appeared to be Fabbrica Italiana Automobili, the initials of which gave the word Fia. This was placed on the office wall, together with a number of others, with a view to soliciting suggestions from all comers.

Probably the word Fia would have been adopted, when some stranger entered the office and wrote after the title the word "Torino," followed by a big interrogation mark. This was a happy thought, for the factory was being established in the town of Turin, and the four initials gave the word "F. I. A. T."

Used Car Show.

The second annual used car show of the Chicago Automobile Trade Association will take place at Chicago, Ill., March 30 to April 7. It will be the second annual event and will be held in the Coliseum. At the 1917 show 369 passenger cars, total value $275,825, were sold. Truck units, commercial cars and accessories amounting to over $52,000 were also disposed of.

Issues Neat Brochure.

The Allen Motor Company, Fostoria, O., is issuing a very neat brochure illustrating and describing the Allen 41 car. The booklet is unusually well illustrated and printed and contains a longitudinal sectional view of the 41 chassis. The points emphasized of the construction are numbered, and these features are fully explained.

COMING EVENTS.

Cedar Rapids, Ia., March 11-16.—Show, Cedar Rapids Automobile Trade Association.
Warren, Pa., March 13-16—Show, Warren Automobile Dealers' Association.
Great Falls, Mont., March 16-20.—Second Annual Show, Montana Automobile Distributors' Association.
Vancouver, B. C., March 19-23.—Western Canada Automobile Show Association.
San Francisco, Cal., March 19-24.—Show, Motor Truck Dealers' of San Francisco.
Houlton, Me., March 20-22.—Second Annual Show, Houlton Motor Car Dealers' Association.
Holdredge, Neb., March 20-23.—Second Annual Show of Southwest Nebraska.
Trenton, N. J., March 20-23.—Show, Trenton Auto Trade Association.
Bridgeport, Conn., March 25-30.—Sixth Annual Show.
Atlantic City, N. J., March 30-April 6.—Second Annual Show.
Hartford, Conn., March 30-April 6.—Show, Hartford Automobile Dealers' Association.
York, Pa., April 3-6.—Show, York Auto Dealers' Association.
Red Bank, N. J., April 6-13.—Show, Monmouth County Automobile Dealers' Association.
Stockton, Cal., April 9-13.—Show, San Joaquin Auto Trades Association.
Calumet, Mich., April 17-20.—Show, Copper County Automobile Dealers' and Garage Owners' Association.
Chicago, Ill., September 23-28.—Accessories for Ford Car Show.

When Dealer's Talk Is a Warranty

I was consulted recently in a way which had never fallen to my lot before. I regard it as a most unique experience. The sales manager of a wholesale concern who not only put selling talks in the mouths of his men, but also does considerable selling himself, came to me and laid before me a problem which was substantially this: "I am an exuberant salesman. It is my way to enthuse over my goods, and when I am enthused I am apt to say more about my goods than I intend to. Only last week a customer pinned the house down to something I had said, which he contended amounted to a guarantee and which I had no right to give at all. I had to admit that I had said about that thing, and the house allowed his claim. I have been told that a man is allowed to brag up his goods, to a certain extent, and isn't held strictly down to every word, now I want to know how far I can safely go in my selling talks. Is there any rule which I can use and have my men use, so that what I say will be only ordinary selling talk and can't be regarded as a guarantee?"

Dealer's Talk.

I gave him the best advice I could on the subject, and the incident is responsible for this article on "Dealer's talk: What it amounts to in the sale of goods."

The inevitable conclusion after reading and digesting the law on this subject—there are innumerable cases—is that there is no rule which a business man can lay down for himself, and apply with certainty, but there are certain useful principles which he can keep in mind, and these should check him from going too far in his representations about his merchandise. Of course this applies to representations made in every way they can be made—by word of mouth, through advertising, in letters and in every other fashion.

The importance of the thing is this: if the seller in what he says about a thing he is selling, stays within the realm of "dealer's talk," he is not liable even if some of his statements are not borne out. But if he passes beyond "dealer's talk," his statements are warranties, and he will be strictly held to every one.

The cases make very little effort to define "dealer's talk." I give a working definition of my own: "Dealer's talk is something less than a warranty, and consists of an expression of opinion or judgment about the article, on a point as to which the seller has no special knowledge, and on which the buyer can be expected to have just as good an opinion and to use his own judgment."

Not a Warranty.

For instance, take a dealer selling automobile tires. He is not an expert. He says of a tire he is selling: "That's as good as any tire on the market." The buyer takes the tire, which isn't satisfactory. The statement "that's as good as any tire," would be considered in my judgment mere dealer's talk.

Note my statement in the above illustration that the dealer was not a tire expert. It would make a decided difference if he were an expert, for many cases hold that a statement made by a non-expert, which would be considered no more than dealer's talk, would be considered a warranty when made by a dealer having expert knowledge of the article he was selling.

From a couple of leading cases I assemble the following statement of the law governing the subject:

Mere commendation, praise or brag by a dealer, is not a warranty. Each seller has the right to extol the quality of his wares, and much latitude has generally been allowed, the language being regarded more as an invitation to purchase than as a warranty.

It is to be conclusively presumed that the buyer knew or ought to have known enough not to rely upon dealer's talk or the praise of their goods ordinarily indulged in by sellers.

This last paragraph is rather a sad commentary upon the integrity of the average commercial transaction, but such is the well settled law.

Merely Dealer's Talk.

There have been a great many cases in which these principles have been applied. Of course in practically all of them the issue was between a buyer who sought to enforce against his seller a statement (subsequently found to be untrue) which he claimed was a warranty, the seller taking the position that it was not a warranty, but only dealer's talk.

I mention a few of these cases here:

A statement "these are the best goods made," is not a warranty, but merely dealer's talk.

"I think he is sound," spoken of a horse one is selling, is not a warranty if the seller is not an expert veterinarian.

"You'll find this line will readily sell," is not a warranty which the buyer can claim was violated when the line doesn't readily sell. It is only dealer's talk.

"This is a very good machine and will do your work," is not a warranty when no special work has been mentioned between buyer and seller, or the work the machine was to do was mentioned only in a general way.

When a Warranty.

But when a buyer orders a machine for a specific purpose and says so, and the seller tells him: "You may rely on having a first rate machine which will do the work in a satisfactory manner," that is a warranty, and if the machine doesn't do this particular work in a satisfactory manner, the buyer can sue.

Putting the expression "approved standard quality" on a label, or so representing the goods in other ways, is not a warranty.

The rule is different where a man is passing a check or a promissory note, and says "this is good." Value is the only quality negotiable paper has and if it hasn't that it hasn't anything. Therefore every such expression is considered a warranty. Opinions of value as to other merchandise are usually dealer's talk.

The cases all emphasize the great difficulty of drawing the line between dealer's talk and warranty, and each case has to stand on its own feet.

NEW YORK, MARCH, 1918.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

PROMPTNESS REQUESTED.

If the Post Office Department is making money on parcel post packages, which cost to carry an average of 3 cents a pound, why should it claim that the cost of carrying periodicals is 9 cents a pound?

Is not this a manifest absurdity?

The increase in second-class postage, brought about by a Congressman from a State that only publishes local newspapers, looks very much like pure persecution. If you have not already done so, we suggest that you write to the Representative of your district in Congress as soon as possible, and to the two Senators from your State, and ask them to vote for a repeal of this unjust second-class postage measure, which was enacted at the last session of Congress.

We hope every one of our readers who has not already done so will act upon this suggestion promptly.

FORD AS A PRESS AGENT.

Was Henry Ford's peace adventure, when he went to Europe to get the "boys out of the trenches by Christmas" a surpassingly brilliant press agent stunt?

Many things that have happened since could be brought forward to sustain such a view. For instance, after he came back from his supposed wild goose chase and war was declared on Germany, he offered his entire plant to the Government for the manufacture of war materials. He is now putting all his remarkable ability into the work of building submarine boat chasers. While committees and commissions and war boards at Washington discuss and wrangle and plan (though with meagre results) Ford is at work and it is announced that he expects to build a chaser a day when he gets into full swing.

No man in the manufacturing line has succeeded in getting himself advertised, without cost, on the front page of every daily paper in the United States so many times as has Henry Ford.

Barnum, that so-called prince of press agents, even at his best was a child in the matter of securing free advertising in comparison with Ford. From an apparent pacifist of the first rank he has developed into quite as pronounced a fighter and patriot as one could wish to see.

Long live Henry and his car! May his shadow never grow less!

OPPOSITION OF READERS TO INCREASE IN POSTAGE.

Our readers, many of them, have expressed themselves freely on the question of the obnoxious measure passed at the last session of Congress increasing the postage on all periodicals several hundred per cent. There is great opposition to this increase, as there ought to be. One of our subscribers says: "Where would the nation's business be today if it were not for the advertisements?"

Unfortunately, our legislators in Washington, a large number of them, do not appear to regard the advertisements as of any value to the business of the country. They are willing that we should send the reading portion of our publications at the rate of 1¼ cents per pound, or an increase of ¼ cent over the old rate, but after July 1, 1918, the rate will be 1½ cents per pound for reading matter. On the advertising portion of all periodicals, however, the country is to be divided into zones. For one year after July 1 the rate for the first and second zones will be 1¼ cents. This refers to subscriptions located within 300 miles of the place of publication. There are eight zones in the whole country and the rate increases progressively the first year up to 3¼ cents per pound. After that there is considerable increase for one year more, but after the third year the rate for the first and second zones is two cents a pound, increasing up to 10 cents for the eighth zone. The eighth zone will include all the Pacific Coast States, and many of the far Western States.

The lack of business intelligence on the part of Congress in connection with this postage business is shown by this zone system. It is well known, of course, or should be, that publishers cannot have a subscription rate for each zone, but are compelled to have what is called a flat rate, or the same price for all parts of the country, so that the only way they can save themselves from serious loss in all the zones, from the fourth to the eighth, is to largely increase the subscription rates.

Of course, 10 cents per pound for carrying second-class publications, which includes all weekly and monthly periodicals, is an outrageous rate. If this measure goes into effect July next, it will compel the big periodicals published in most of the large cities of the country to increase their rates from 50 to 100 per cent., or to concentrate their efforts for subscribers in the nearby zones, leaving out the

Digitized by Google

far distant subscribers, or compelling them to pay a largely increased price, as we explained in our last issue.

A bill is before Congress now to repeal this unfair measure. If the subscribers of all the periodicals in the country who will be injuriously affected by this law will write letters of protest to their Congressmen and Senators and insist that this law should be repealed, it seems likely that pressure enough may be brought upon Congress to accomplish the desired result.

If you have not already written to your Representative, we would suggest that you do so at once, and also to the two Senators from your State. You can get the name of the Representative of your district from your postmaster, if you do not happen to know it, and he should be addressed House of Representatives, Washington, D. C. The postmaster, also, if you do not happen to remember or know the full names of the two Senators from your State, can supply them, and they can be addressed Senate Chamber, Washington, D. C.

RED TAPE.

The newsapers have had a great deal to say, ever since the war started, about "red tape," especially in the Navy and War Departments. Probably many people have an indistinct impression of what "red tape" means. To illustrate: suppose the Quartermaster-General, who is the head of one of the bureaus of the War Department, wants something that is badly needed, and wants it in a hurry. There ought to be some way for him to get it, but apparently there is not. He must first make a requisition for the particular thing wanted. This requisition goes to the Secretary of War for his approval or rejection. The Secretary of War sends it to the War College. If it is something out of the usual order, the War College appoints a committee to consider the matter. This committee usually takes its time, no matter what the rush may be, and finally hatches out an opinion, which it reports back to the War College for approval. This opinion may differ considerably from the original idea of the Quartermaster-General.

The War College returns the requisition, with its endorsement, one way or the other, on the back, to the Secretary of War, and the Secretary of War performs a similar function and sends the requisition back to the Quartermaster-General. If it happens to be approved all the way through, the Quartermaster-General can then act.

In the meantime, a week or two or even a month may have elapsed, when, as stated, he was in a hurry to get what he wanted. That is the usual process of what happens in the various departments of the Government. There seems to be no way for any department to get its wishes fulfilled speedily and directly.

Last summer, after war was declared with Germany, and time was of the utmost importance, a committee was appointed to select a machine gun. This committee spent three or four months experimenting, and finally fixed upon a gun—the Browning—which has never been tested in the field. No arms company or Government workshop was in a position to make these guns. The tools and machines necessary first had to be made, so that no guns have yet been delivered. General Crozier, head of the Ordnance Department, testified recently before the Military Committee of the Senate that none of these guns probably will be ready before next April, and that it will be July before we would have much of a supply—or considerably over a year since war was declared.

Naturally, the average man of common sense wonders why General Crozier's department had not done some experimenting for the purpose of selecting a machine gun long before war was declared. The dark cloud of the European contest hung over the country for two years, with every prospect that the storm would finally reach us, but the complacent heads of the various departments could see no reason for action looking to being ready for an emergency if one should arise.

The Government was also without rifles, and proceeded deliberately to experiment for a time on a new model, which could not be made in any quantity rapidly because there was no machinery built for the purpose. The result of this negligence and failure to prepare properly has been that thousands of our young men in the various military camps have been compelled to drill with wooden guns. It would appear that we are just as wofully lacking in the artillery department as in all the others, and that we have no big guns whatever such as are being used in the great European war, and with not much prospect of having any for some time to come. "Red tape" and inefficiency are of course responsible for the conditions referred to.

Recently, here in New York, the Merchants' Association sent a request—an urgent request—to the Secretary of War to provide guards for the new shipyards at Newark. Of course the request had to go on the usual crooked road, and was at last referred to the commanding general of the Eastern Department. He appointed a committee to consider the matter, and this committee did not consider it advisable to use soldiers for guarding industrial establishments of this sort. A month elapsed before the Merchants' Association even got a reply to its request. Meantime, the enemy agents got busy, as was to be expected, and set fire to the Newark works, resulting in damages of over a million dollars, though the entire plant was fortunately not destroyed.

It would seem as though every shipyard and industrial plant where Government work is going on should be guarded carefully by soldiers, not by civilian guards. Several explosions, accompanied by big fires, and causing damage to the extent of millions of dollars, have already occurred because of the lack of proper military protection.

We all want to see the war prosecuted vigorously and intelligently, but few of us can have any patience with such inefficiency as we have outlined.

Death of George Batten.

George Batten, president of the George Batten Co., Inc., advertising agency, died on Saturday, February 16. Mr. Batten was well known throughout the country as the head of one of the most important advertising agencies in America and a great deal of the success of this agency was unquestionably due to his personal ability. He will be greatly missed by a large circle of friends and acquaintances.

Helpful Hints and Mechanical Suggestions

To temper small springs, etc., heat to a cherry red and cool in rain water, dip in hard oil, hold over a fire until the oil burns off; repeat the oil dip twice more and then cool off in oil. Knife blades of thin steel can be tempered without warping by laying them between two pieces of iron. Bolt together and heat to a cherry red, cool in rain water and draw temper by dipping the back of the blade in hot lead until you get a ark stone color on the edge, then quench.

Annealing Small Pieces.

To anneal small pieces of steel or tools heat up slowly to a red, and then take two pine boards and lay the hot steel between them, and screw them in a vise. As the steel is hot it sinks into the wood and is enclosed in an almost air-tight charcoal bed. When the work is removed after cooling it will be found to be very soft. The boards prevent the steel from becoming cooled off too quickly. The operation can be repeated when necessary.

Thread Marking on Bolts.

Sometimes bolts have to be shortened and the thread does not permit of the proper adjustment of the member or the nut. Where a die is not available the bolt can be marked for threading and new threads cut by the following method: A piece of board is cut so that the notch will fit the nut, and a hole made at the other end by driving in a nail and drawing it out. A pencil is next inserted in the hole and rubbed with chalk. By turning the nut and attached wood device the pencil marks the bolt so that the threads may be cut with a three-cornered file.

Driling Holes in Lead.

Drilling holes in lead is not so easy as it would appear, as the metal is soft and a ragged burr generally is the result of the work. Use a good grade of lard oil and plenty of it. Lift the drill two or three times and clean out the chip. With power a speed of 800 revolutions a minute should be employed.

Speeds of Cutting Tools.

To secure the best results from steel used for cutting purposes, attention must be given to the use of calculations in determining the proper speed of the work or tool, according to the conditions. The average machinist in ordinary practise does not make use of these rules, but depends on the knowledge acquired through experience and observation. For the benefit of those who are not familiar with rules for finding cutting speeds, and to obviate the necessity of guessing at the proper speed, the approximate cutting speed at which tools or work should be run in the machining of different metals is herewith given:

Cast iron, 14 to 16 circumferential feet a minute.
Malleable iron, 16 to 20 feet a minute.
Steel, 12 to 15 feet a minute.
Brass, 28 to 40 feet a minute.

The circumstances and conditions upon which slight variations of the speeds given depend are numerous, among which are: Whether a rough or finishing, coarse or fine cut, is being taken; the form and shape of the cutting tools; the toughness and density of the metals being worked upon, and the surface machined without regrinding. There is considerable work done in the lathe or planer which requires cutters that project far out of their holders. For such work the cutting rates must be considerably less than above given. Very often the texture of the metal is tough and hard, necessitating slower working and fine feeds in machining.

Drilling Hard Iron.

Hard castings or hard iron can be drilled more easily if turpentine is used on the drill. Turpentine on a file makes filing these metals more easy.

Welding Low Steel.

To weld low steel or iron to malleable castings, use one part sal ammoniac and 10 parts borax. Melt together, then grind fine.

Restoring Burnt Steel.

Steel that is burnt can be restored to a certain extent by heating to a red, cooling in water and repeating the treatment several times; that is, if the steel is not burnt too badly.

Temperatures for Hardening.

The following gives the required temperature in Fahrenheit degrees to produce certain colors when tempering hardened steel: Lathe, shaper and planer tools, 430, very light straw; 450, light straw. Taps, dies and turning tools, 470, dark straw; 490, very dark straw. Hatchets, chisels, etc., 500, brownish yellow; 520, yellow, tinged with purple; 530, light purple. Springs, 550, dark purple; 570, dark blue.

Removing Dents from Brass, Etc.

Dents in lamps, etc., can be removed by utilizing a burnisher. Place a solid substance on the underside of the object and with a little pressure of the tool on the opposite side, the indentations can be smoothed out. The burnisher should be made of tool steel and highly polished after being hardened. Tools for any desired shape can be made for the work in hand.

Cutting Square Threads.

Square threads can be cut on the lathe by the following kink: With an ordinary V-shaped cutter, form a thread of the proper lead that will be equal in depth and width to the cut of the finished square. Then follow down with the regular square tool. This saves the latter which cuts a divided or broken chip. A roughing member should be used before cutting. If more than one piece is to be threaded, rough first then finish, as this will keep the tool snarp and result in a nice finish. The rougher should be speeded up and allowed to dig out the metal without regard to the finish.

Drilling Glass.

The average repair man seldom is obliged to drill a hole in glass, but when this is necessary in windshields, or headlights, he may not know just how to do the work. Obtain an old, three-cornered file, and grind it so that it has six corners and comes to a point. With this tool, and liberal applications of crude oil, the drilling operation is greatly simplified. Turpentine is sometimes used in place of the oil, but is not as good.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2376 Valve Clearance in Overland.

From T. M. Perkins, Texas.—Will you please tell me the proper valve clearance in an Overland Model 42? What is the cause of smoke rising from the breather pipe? Can you tell me where the part of the automobile called the skid is located and what is its purpose?

Reply. — When cold the clearance between the valve stem and tappet should be approximately .003 of an inch, a setting which should be checked after the engine has heated. After the engine has run for a number of minutes and is well heated, stop it and with the hand crank turn it over until the first tappet has opened the valve and closed it, continue to turn for one-quarter of a revolution, then see that the tappet is free and does not bind on the valve stem. Should it bind, the adjustment should be made to between .0015 and .002. Each valve and tappet should be adjusted in the same way.

The smoke from the breather pipe may be due either to overheated oil in the engine base or compression leakage past the pistons. We do not know of any automobile part called the skid. Possibly you refer to a skid as used for storing an automobile in a freight car, which is simply a method of blocking the automobile to prevent it from rolling in the car.

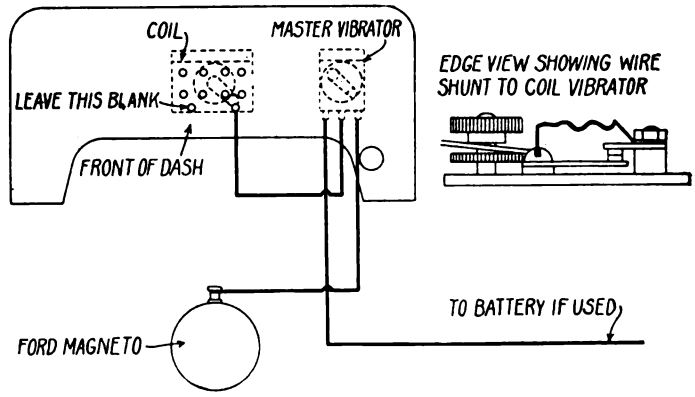
2377 Hupmobile Timing.

From J. J. Martell, Michigan.—Will you kindly tell me how to time the magneto on my Hupmobile roadster? The magneto is marked Bosch DU4 and has a set spark. Will you also tell me how to adjust the carburetor, which is a Breeze? Would a Ford carburetor work all right on this car?

Reply.—The Bosch model DU4 magneto should be timed to make a spark at top center of the piston in the firing cylinder. Turn the engine over until the piston in number one cylinder is at the extreme top of its stroke, when both exhaust and intake valves will be closed. Remove the magneto breaker box cover as well as the distributor cover and turn the magneto shaft until the distributor brush is directly below the terminal leading to number one cylinder. At or near this point the points in the breaker box will start to separate and the gears will mesh. To check the timing, turn the engine over until number two piston is at the top of its firing stroke when the breaker point will snap apart, and the distributor segment will be below the terminal leading to number two cylinder.

For adjusting the Breeze carburetor, first open the needle valve for about one turn and start the engine. Open the throttle slightly and turn the valve back until the engine begins to slow down or backfire, then forward until the engine shows highest speed. Open the throttle three or four notches, suddenly, and note the engine action. If it acts sluggish, loosen the auxiliary air intake adjusting nut and turn the adjustment toward the right or clockwise, letting in more air. If it fires back, turn the adjustment toward the right. Open the throttle to about half way on the quadrant and find the air adjustment which gives the best results. After adjusting, be sure to tighten the lock nut. The regular Ford carburetor should give good results on this engine if the manifold connections are the same and the manifold opening on your machine is no larger than the opening into the carburetor.

2378 Removing Motor Starter.



From J. McGiveron, New York.—Kindly give me a wiring diagram for a 1915 Maxwell with the starter removed; that is, I want to disconnect the starter from the car and do away with it, to start the engine with the crank.

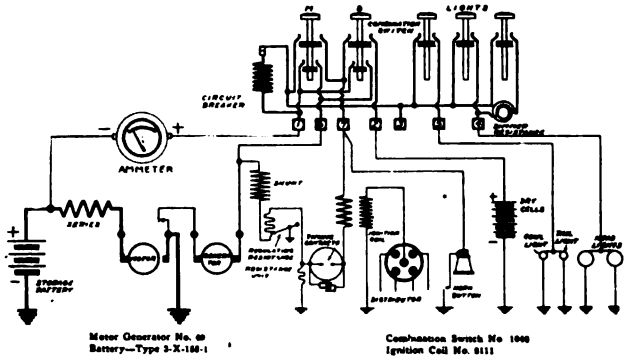
Reply.—The only precaution necessary to take in removing the starter from the engine is to properly insulate the wires when displacing them from the starter in order to avoid any danger of the battery discharging through contact of the wires with metal of the car, etc.

2379 Wiring Master Vibrator.

From New Reader, Iowa.—I purchased a second-hand Ford and am told that using a master vibrator will make the engine run better as the coil is an old one. Is this true? How should vibrator be wired?

Reply.—A master vibrator will improve the operation of an engine relying upon multiple induction or vibrating coils. This is due to the fact that synchronization is possible with the master vibrator, whereas with multiple unit coils, particularly when worn, it is difficult, if not impossible, to obtain synchronization. The accompanying illustration shows

Illustrating How Master Vibrator Is Wired on Ford.



method of wiring. The shunt shown can be accomplished by using a wire or screwing down the adjusting screw to make a fixed contact between it and the vibrator blade of the coil.

Digitized by Google

2380 **Attaching Ammeter.**

From N. D. Collins, Vermont.—Will you please publish a wiring plan showing how to attach or install an ammeter in a model 37 Oakland car, a 1915 design?

Reply.—An accompanying sketch shows the place to insert the ammeter in the circuit, in the charg-

Circuit Diagram of Model 37 Oakland Showing Location of Ammeter.

ing circuit. The connections should be made by removing the wire from the No. 1 terminal on the back of the switch, and connecting this wire to the negative terminal on the meter, and from the positive terminal on the meter, connect a similar wire to the No. 1 terminal on the switch. A meter thus connected will show both the charge and discharge rate of the storage battery.

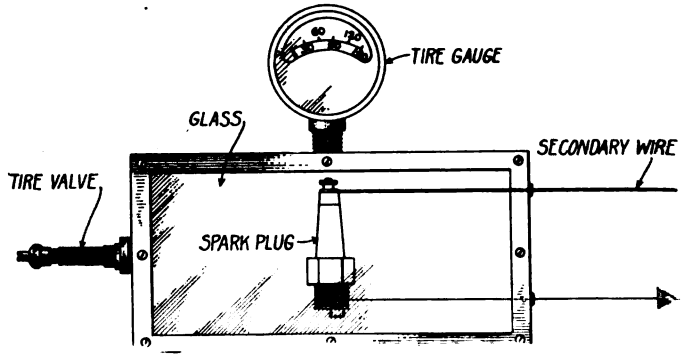
2381 **Kerosene As a Fuel.**

From L. Minch, Indiana.—Do you think that kerosene can be burned successfully in a four-cylinder, four-cycle motor? Do you think that this fuel can be used equally well in opposed engines and upright?

Reply.—The burning of kerosene oil in any internal combustion engine has not as yet been established to its full efficiency and is a problem that is bothering the engineers of today. The main trouble experienced is in properly vaporizing the fuel. Unless considerable heat is used, the fuel has a tendency to condense in both the manifold and cylinders, and thus "load up" the engine. In a vertical block engine, the condensed fuel would eventually find its way past the piston rings and into the crankcase, and its path of travel being distributed around the piston, it would cause little or no bother from cutting the lubricant. In the horizontal type, however, condensation would occur, and the fuel would drop to one side of the cylinder, and the cylinder oil might be diluted on this side and cause trouble. If an engine of the horizontal type were fitted with an efficient vaporizing device, the trouble might not occur. If you have any particular make of engine in mind, of either type, for kerosene oil burning, we would suggest that you investigate the record of performance of this engine. If the manufacturers are well known and established, they will be glad to give all information required.

2382 **Intake Speeder Device.**

From J. Paterson, Nebraska.—I should like to find out if the following device would damage my engine. To the intake manifold I should like to attach a petcock and take hot air from the exhaust manifold by means of a copper tube. The petcock would be regulated by a rod from the instrument board. I find that I can increase the mileage five miles to a gallon of gasoline. I am told that a certain amount of grease on the Ford timer will cause the timer to give better results and give a hotter spark. Is this correct? Is not Dixon's graphite lubricant the best to use?



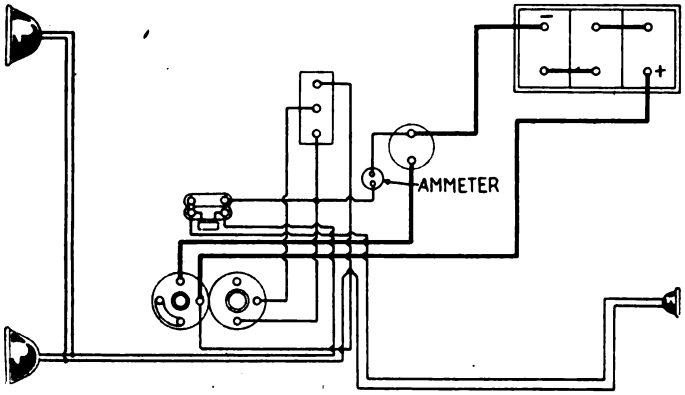
Reply.—Your idea of attaching a petcock to the intake manifold, in order to admit extra air at high engine speeds, is good and there are a number of such devices now on the market, which accomplish the same end. The hot air connecting tube should be wound around the exhaust manifold and not tapped into it, or there will be danger from fire. You might try the hot air tube device, as you suggest, but you should also try the engine without the hot air connection, for it is hard to tell just how the increased expansion of the mixture, due to the hot air at this point, will effect the volume of gas entering the cylinders.

The Ford timer will give better results if it is properly lubricated. A very small amount of vaseline or three-in-one oil answers the purpose nicely. Dixon's graphite compounds cannot be used in electrical systems of any sort, as it is a good conductor of electricity. For this reason it should not be used in the Ford timer or in the crankcase. You might write the Joseph Dixon Crucible Co., Jersey City, N. J., asking for their booklet relative to uses of their products.

2383 **Testing Spark Compression.**

From E. J. Sanger, Colorado.—Will you kindly tell me if there is any way to test a spark plug under pressure? I would very much like to have something on this order. I think it would be best if it was made out of glass so I could see the plug under test. It would have to be strong, as I would like to make the test with about 100 pounds air pressure. Kindly let me know if there is anything like this on the market.

Reply.—In so far as we know there is no device marketed as described. A tester can be made, however. An accompanying illustration shows the principles involved. It consists of a metal box or frame and the frame can be tapped and drilled so that the plugs can be screwed into it. A tire gauge is inserted as is a pressure gauge. The top or side, for that matter, can be made of heavy plate glass and screwed to the container. A rubber gasket should



Illustrating Method of Testing Spark Under Pressure.

make the glass member tight and prevent leakage. The pressure or air is introduced through the tire gauge and to the desired pressure. If the tester is used on the bench the shell of the plug will have to be grounded. This is indicated in the sketch.

2384 **Ammeter and K-R-I-T Car.**

From William Glasser, Pennsylvania.—My father has a five-passenger, year 1914, and bought an American Ever Ready ammeter. He has been to several garages to get it connected, but without results, so will you please give me instructions how to

Wiring Diagram Showing How to Insert Ammeter in Disco Lighting and Starting Circuit of K-R-I-T Car.

connect it? It is a two-wire system on the car and has no dash switch. I am a machinist and understand drawings.

Reply.—The accompanying wiring diagram shows how to insert an ammeter in the starting and lighting system of the K-R-I-T car.

2385 **Bosch Magneto Trouble.**

From F. G. Hoskins, Texas.—I have a White car, equipped with a Bosch DU4 magneto. By retarding the spark for cranking I get a good spark and have no trouble starting the engine. As soon as the spark is advanced, however, the current seems to weaken and I am forced to run on a retarded spark at all times. Can you tell me the reason for this?

Reply.—There are two reasons for your trouble: first, that the magnets may be weak; second, that the breaker points do not separate at the time when the low tension winding is cutting the greatest number of lines of force. The latter is probably the cause.

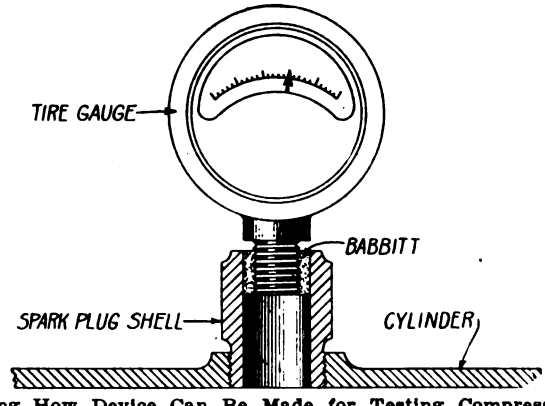
At some time or other you may have removed the timing gears or even the one carrying the distributor and slipped them around a cog or so. Unless you are an expert in this line we doubt if you will be able to make the repair and would suggest that you take the magneto to some electrician, who will probably be able to locate your trouble in but a few minutes.

2386 **Troublesome Knock.**

From W. J. Eastbaum, New Jersey.—I have been having some trouble with my 1912 six-cylinder Mitchell car of late. There seems to be a knock which I cannot locate. At car speeds of between 15 and 20 miles per hour the knock is not heard, but at higher speeds it begins to sound. The engine has been completely overhauled, all the bearings fitted, new cam shaft bushings, valve guides, push rod guides, wristpins and wristpin bushings and new rings, but the knock still remains. I have done everything I know to remedy it. When number three spark plug is short circuited the knock is deadened. Can you offer any suggestions?

Reply.—The fact that by stopping the explosions in number three cylinder has a tendency to lessen the knock is indication that the whole trouble is in the piston connecting rod assembly. The writer has had a similar experience with an engine and finally found the trouble was caused by the babbitt working loose in the bronze liner. If your car is fitted with this type of connecting rod bushing you might inspect it at this point. Be sure that the wrist pin is firmly clamped in the piston. It may be that though the wristpin fits the bushing in the connecting rod, the fit in the piston is poor. Such a condition would cause a knock.

2387 **Castor Oil as a Lubricant.**



From A. H. Taylor, Maine.—Can you tell me if castor oil is any better for an automobile engine than an oil with a mineral base? If castor oil is the best, I should like to use it, but I don't want to take chances and perhaps spoil my engine.

Reply.—Editorial policy does not permit us to recommend either castor or mineral base oils, but we will give you the manufacturers' arguments, both for and against. As a lubricant, castor oil ranks, perhaps, the highest. Like any vegetable oil, however, in time it may give an acid reaction. Castor oil is used by many racing drivers and in many airplane engines where the matter of lubrication is of first importance. Properly treated and carefully tested from time to time, this lubricant should give satisfaction with but little attendant danger. Mineral oils usually stay in the same condition as when manufactured, and seldom show acid reaction. We would advise you to interview agents representing both types of oils before making a decision.

2388 **Pressure Gauge.**

From W. H. S., Rhode Island.—Will you please publish a picture and give a description of how to make a gauge for testing poor cylinders? You very often mention testing the compression in replies to readers.

Reply.—While gauges can be purchased one can be made without any great expense and with little labor. Procure a pressure gauge, such as is used on tire pumps for example. Next take an old spark

Showing How Device Can Be Made for Testing Compression of Cylinder.

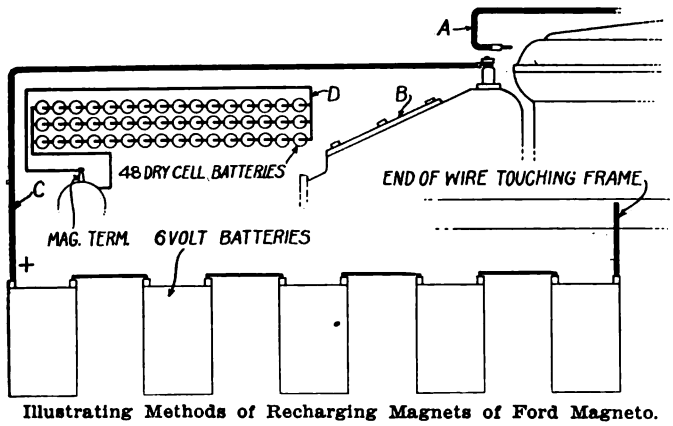
plug shell, the threads of which are in good shape, and insert the gauge in it, using babbitt or lead to seal the opening. In other words, see that there be no leakage. A special reducing nipple can be used in place of the lead or babbitt.

To use the tester the spark plug shell is screwed into the cylinder as you would a spark plug. Crank-

Digitized by Google

ing the engine until the piston of the cylinder completes the compression stroke will result in the air pressure registering on the gauge and in pounds. The device will be useful for testing for leaks. In using make sure there be no leaks around the threads of the tester.

2389 **Taping Magneto Coils.**



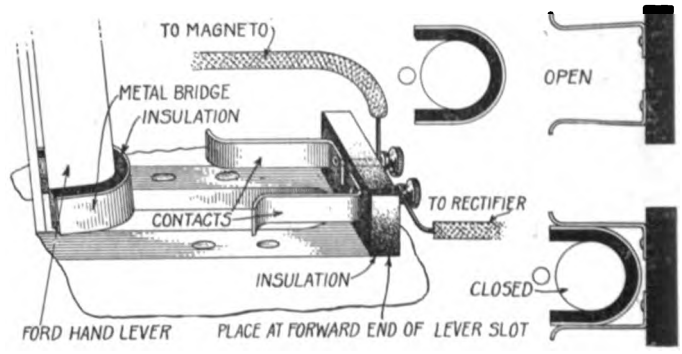
From M. L. Madsen, North Dakota.—I have a 1916 model T Ford. Some of the tape is off the coils leaving the copper bare. Can I not take these coils out and rewind them with new tape, then shellac them? What kind of tape should I use? I could shellac them now as is, but am afraid they would short circuit.

Reply.—The work can be performed as stated. In taping the parts employ an electrician's tape, one that is made especially for this work. Ordinary friction tape will not serve the purpose.

2390 **Magnetizing Magnets.**

From W. H. Rowland, Virginia.—Can a Ford magneto be remagnetized with dry batteries? If so, how?

Reply.—Dry cells can be utilized for the work but it will require 48, as shown in the accompanying drawing at D. The cells are used in multiple series. This is rather an expensive way to do the work, owing to the large number of batteries required. Another method is to employ five or six six-volt storage batteries and arrange them as shown. Disconnect the wire A which leads from the magneto terminal to that of the coil. Next displace the cover B of the transmission. Locate the brass studs on the rim of the flywheel which holds the magnets in place, and have some one crank the engine slowly until one of these brass studs is in line with an imaginary line drawn about one inch or so to the left of the magneto terminal and paralleling the frame. Another way is to place an ordinary small compass on the cover to the left of the terminal, at the same time turning the engine until the needle of the compass is parallel with the engine. The north pole of the needle should point toward the engine when in this position. Connect a wire from the positive + terminal of the battery to the mag-



Illustrating Methods of Recharging Magnets of Ford Magneto.

neto terminal, as shown at C. Next connect a wire from the negative — terminal on battery, and make and break the circuit by touching the free end of the wire on some metal part of the engine. Do not make permanent connections. Make 30 or so very brief contacts.

2391 **Chemical Rectifier.**

From L. E. Seely, New York.—I read with much interest the article that appeared in the January issue, page 39, dealing with a chemical rectifier. I wish to ask a few questions as to its arrangement. 1—Will a rectifier of this type deliver enough

Illustrating Simple Switch Controlled by Lever for Preventing Current Passing Through Magneto When Engine Is Inoperative.

current to the battery to keep it charged if current is taken from the battery for ignition and lighting? I do not run nights. One Prest-O-Light gas tank will last me from one to two years. 2—Would a condenser increase the efficiency if placed in the system and at what point? 3—Would a battery stand up well under this kind of a current as under the current of a direct current generator? 4—All of the above questions refer to use of the rectifier with the Ford magneto. 5—Of what dimensions should the plates be, and can you suggest where they can be obtained?

Reply by Geo. A. Luers.—1—There is no advantage in using current from the battery for ignition, horn or headlights. Would suggest using magneto for this purpose and using the battery for lighting when the engine is not running. 2—Do not know the type of condenser you propose using. Do not believe in using anything that would tend to set up resistance. It is best to use the shortest wires possible in the battery wiring so as to keep resistance at the minimum. 3—A generator designed purposely for use in connection with a storage battery will give better results. The late model Fords have a magneto that delivers more current than the earlier types and it is to store the excess current from these that the rectifier will be of value. Charging will be in proportion to the speed of the engine and length of time it operates. In other words, you cannot expect to charge a battery when the generator or magneto is inoperative. The early type Ford magnetos generated only current enough for ignition. 5—The plates should be about 3x5 inches, although the size is not of as much importance as are the wiring and materials. Plates can be obtained from some local foundry. It is suggested that the correctness of the wiring and efficiency of the rectifier be tested by means of an ammeter before connecting it with the magneto. The current should not pass from the battery through the rectifier and if it does the ammeter will indicate this when the magneto lead is placed on one contact of the ammeter and the instrument grounded on the car frame. You may know that current passing through the Ford magneto will do it no good, that it will possibly affect the polarity of the magneto.

Unless the rectifier be cleaned occasionally, electrolytic deposits may gather and create a path for

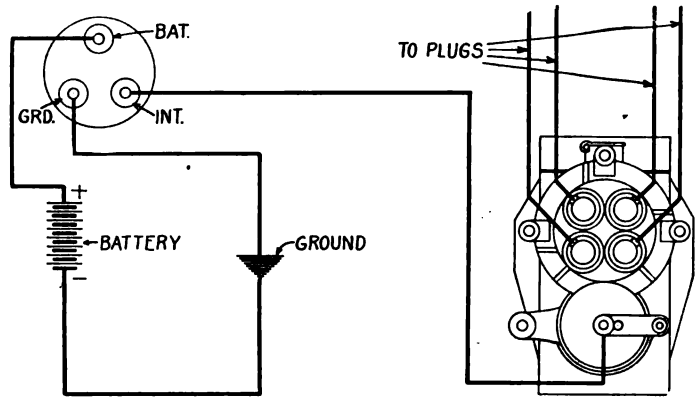
Digitized by Google

the current, creating leakage. To overcome the possibility of this or the chance of any short circuit around the rectifier, one can install a switch and so arrange it that it will be actuated by the speed lever of the car.

The advantage derived from this arrangement is that when the engine is stopped the clutch lever is pulled back, avoiding the possibility of any current passing through the magneto when it is not operating.

Test your battery regularly and have it charged if needed on cars having generators of no greater capacity than the Ford. If you do not use your car a great deal, then it may be well to construct a second rectifier of the same type, but larger to charge from the house lighting circuit. The switch referred to is shown in an accompanying illustration and requires no further explanation.

2392 Bosch Magneto Installation.



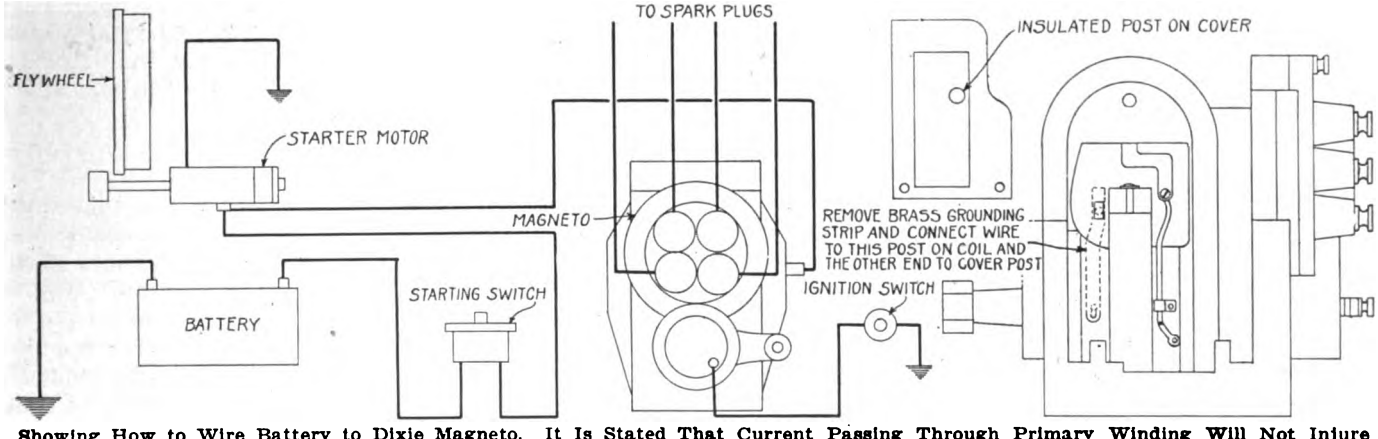
From Ed. Feala, Wisconsin.—Will you please tell me how I can install a Bosch magneto on a Ford engine?

Reply.—The Bosch Magneto Co., 223 West 46th Street, New York City, manufacture a special magneto equipment for the Ford car, which consists of a casting to be bolted on the front of the crank case and a gear for attachment to the cam shaft in place of the present timer. The magneto itself is bolted on to the casting.

2393 Using the Dixie Magneto.

From M. E. T., New Jersey.—In your answer to No. 2326 you advised him not to attempt to connect a battery to the magneto. This answer is correct for all magnetos of the true high-tension type except the Dixie. With the Dixie one can so wire the battery to the magneto that the magneto will operate when the starter is used. An accompanying illustration shows how to wire a battery to the Dixie magneto. The current passing through the primary winding of the magneto when the starter is operated is not enough to demagnetize the magnets. This is due to the unique construction of the Dixie instrument.

The Dixie auxiliary vibrator system permits the use of a battery in conjunction with a Dixie magneto, to assist in starting gasoline engines in cold weather or when cranked by hand. The auxiliary vibrator system consists of a vibrator, two small windings and a condenser, all housed within the switching device. The battery current is carried through the vibrator to the circuit breaker of the magneto; the high tension current being distributed



Illustrating the Wiring Plan of the Dixie Auxiliary Vibrator System, Permitting Use of Battery With Dixie Magneto and For Starting in Cold Weather.

to the spark plugs through the distributor on the magneto.

On the face of the switch are three letters, B. O. and M., meaning battery, off and magneto. When the switch lever is placed on either B. or M., the engine then operates on the source of ignition to which these letters refer. It must be understood, however, that the battery is intended only for starting. It should also be borne in mind that the battery will become exhausted if the switch lever is left on the battery position when the engine is not running.

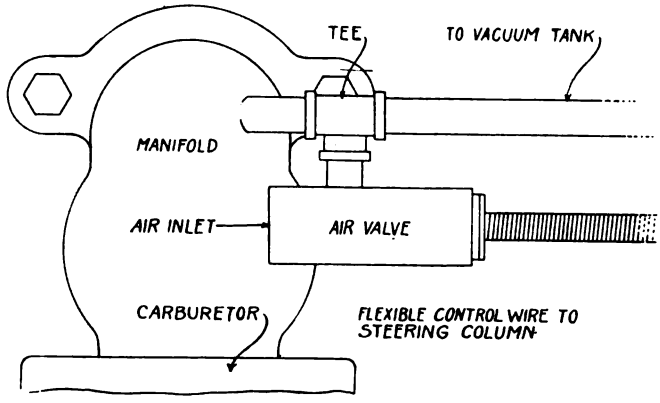
The wiring of the Dixie auxiliary vibrator system is very simple, as will be seen from the wiring diagram. This shows the post marked bat connected to the battery. The other side of the battery is grounded. The post marked int is connected to the grounding terminal on the magneto and the post marked gr'd is connected to some part of the engine or frame as a common ground.

When the switch lever is placed on the battery position, the current from the battery is conducted through the vibrator windings to the vibrator and to the primary circuit of the magneto. The vibrator is simultaneously set into operation with the throwing of the switch lever on battery, but no sparks are produced at the plugs until the cam opens the platinum points, thereby bringing the magneto primary winding into the circuit. A continuous shower of

Showing How to Wire Battery to Dixie Magneto. It Is Stated That Current Passing Through Primary Winding Will Not Injure or Demagnetize Magnets.

Digitized by Google

connecting one switch terminal to spark plug and the other switch terminal to one headlight igniter, carrying same wire over to second headlight igniter. When engine is running you either get a spark at spark plug or at headlight igniter. Of course, the engine is only running on three cylinders whilst you are lighting the acetylene gas.



I was able to light my headlights whilst the car was running by carrying a control rod up the side of car at left-hand side. This enabled me to turn on the gas. To avoid explosion in headlights, it is just as well to turn on the spark before opening up the gas.

Using Air Valve.

From E. C. M. Cell, New Jersey.—In your reply to No. 2334, Frank S. Pickering, I note you do not recommend installing tube entering manifold near the fuel feed. I have installed just such a device and it has never given me any bother with my vacuum tank.

I have a Dodge car which has a Stewart carburetor and a Stewart vacuum tank. The vacuum pipe enters the manifold and just above where it enters I installed a "tee." This gives a straight through line to the tank, also an opening on which to fit a gas saver or air valve.

The one I put on consists of a small cylinder with a piston valve controlled by a flexible wire with leads

Showing Mr. Clarke's Method of Installing Air Valve in Intake Manifold.

up to a lever control attached to steering column.

This has the advantage of being practically noiseless compared with any air valve which has its inlet on the driver's side of the dash.

I found, however, that my mixture was so nearly right that admitting any extra air did not increase engine power except if the car was stopped and the engine idling for a few minutes. Opening the air valve slightly made the engine speed up.

I use the air valve for cooling off the engine quickly by shutting off ignition and opening valve wide whilst coasting down hill leaving clutch in, of course, and gear in high. Also use it to introduce kerosene into engine by means of a piece of rubber pipe attached to air valve giving the engine a "dose" whilst it is hot. This helps carbon and loosens up the piston rings.

Turning Hard Rubber.

From Arthur Boettcher, Colorado.—As lathe work is necessary to mechanics, this may interest some one who tries to turn prepared rubber. I had to face off some hard rubber discs and tried different steel, but couldn't cut it perfectly. At last I broke off a piece of emery wheel in V shape and fastened it in tool post. The result was a perfect job.

A Clutch Trouble Remedied.

From F. J. Smith, Kansas.—In looking over back numbers of your magazine, I noted an inquiry from B. H. H., Pennsylvania. If he has not found a remedy the following may be of service to him.

Hold clutch open and wash by squirting gasoline while the engine is running. When thoroughly washed lubricate with neatsfoot oil. Keep clutch spring tight enough and so that clutch will not slip.

Buy United States War-Savings Stamps.

Most of our readers no doubt are familiar with the War-Savings Stamps issued by the Government in denominations of $5.00 each. You pay the Government, say $4.14 for March and on January 1, 1923, the Government will pay you $5.00. The difference between what you pay and $5.00 being your interest. As the months progress the amount you pay the Government is a few cents more each month, as the interest accumulates.

You can obtain cards at almost any post office in the United States and if you do not wish to pay the entire amount, you can pay 25 cents a week, until the full amount has been paid. These stamp cards will cost you nothing. This form of helping the Government has proved to be very popular. It encourages thrift and the habit of saving.

Ford Prices Increased.

Unlike nearly everything else, the price of the Ford car has not been increasing steadily, and it was something of a shock to the people not long ago to find that the car cost had been increased. Late last month $90 was added to the cost of the touring car and runabout, while the chassis was increased by $75, bringing the price of the touring car to $450, the runabout to $435, and the chassis to $400. In addition to this, there will, of course, be an advance in the war tax which is figured upon the purchase price.

At the present time the daily output of cars at the Ford factory averages 1,600, or only about 40 per cent. of the normal output before war conditions arose that necessitated changes in the plant.

Industry Uses Little Coal.

Although the automobile industry ranks near the top in magnitude among all the manufacturing industries of the nation, it is a very light user of coal. According to report of the U. S. Bureau of Census for the year 1914, it ranked in forty-second place in tonnage of coal consumed. Less than half a million tons were used in automobile and motor truck plants in that year, while 31 other industries used more than 1,000,000 tons each, six used more than 2,000,000 and seven consumed more than 5,000,000 tons each. Steel works and rolling mills used more than 20,000,000 tons during that year, clay products companies more than 8,500,000, cement plants nearly 6,750,000 and paper and wood pulp mills more than 6,250,000 tons.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusable accident of a collision at a railway crossing.

Despite the safety first campaign which is sweeping the country, automobile accidents continue to occur in ever growing numbers. It would seem that drivers should realize the importance of exercising care at railroad crossings, for if they did, many of the more serious accidents would never occur. Even if the driver does not think particularly of his own safety, he should feel greatly responsible for those passengers in his charge. Second in number to railroad accidents are those caused by skidding. Many of the latter take place on steep grades, where a little care and the slowing of the car speed would be sufficient to keep within the factor of safety. On cold, damp, or rainy days the driver of a car fitted with side curtains should be particularly careful. One should note the last example quoted, and receive a lesson thereby. When not entirely familiar with the road proceed with caution. A minute saved sometimes results in a life lost.

Car Backed Down Hill.—Misjudgment of engine power by the driver recently resulted in death to one occupant of a machine near Charmian, Pa. The chauffeur tried to drive the car up a steep grade and stalled the engine. The car began to drift down the hill backward, and the driver lost control. After a short distance the car ran to the side of the road and overturned. The chauffeur and one other passenger escaped.

Inattention to Business.—Because the driver chose the wrong moment to look over the side of the car, to be sure that all the baggage on the running board was safe, two persons were painfully injured near Ridgeville, W. Va., and the car badly damaged. The point where the accident occurred was at a curve, which the machine did not negotiate, going off at a tangent and hitting a post.

Skidding at a Curve.—One man was killed and a woman badly injured near Cuddebackville, N. Y., when a heavy Renault roadster skidded at a curve and overturned. So great was the momentum that the car turned completely over and was found some time later with all wheels on the ground.

Driving in Front of Train.—Three automobilists were probably fatally injured at the Carleton avenue crossing, L. I., recently, when they were hit by the Long Island Railroad train. Though the engineer claims to have blown his whistle, as required, 500 yards from the crossing, the driver evidently did not notice the approaching train and drove directly upon the tracks.

View Obscured by Storm Curtains.—A man and his wife were badly injured and the car cut almost in two by a railroad train at Lodi, Cal. They had started home and reached the crossing when the accident occurred. Though the danger signal at the crossing was in working order, they failed to see it because of the storm curtains on the car, and drove directly in front of the locomotive.

Machine Hits Freight Train.—A peculiar accident happened recently at Lafayette, Ind., when two men escaped with sundry injuries. The driver had put on full speed to make a steep grade leading to the railroad crossing. Near the top of the embankment he noticed an approaching freight train, and realizing that his machine could not be stopped in time, swerved toward the oncoming train, hitting it a glancing blow, with terrific force. The presence of mind of the driver thus averted what might have been a serious accident.

A Case of Too Much Drink.—Another wreck caused by "Booze" was recently found abandoned near Waterloo, Iowa. The machine had crashed into a boulevard lamp-post and was much the worse for the encounter. Though the driver was nowhere to be found, the machine was saturated with beer, and bits of broken jugs gave indication that the car had been used to carry this liquid.

Car Hits Wall.—What seems to have been an avoidable accident, and due entirely to carelessness, happened at Washington, N. J., when a woman was instantly killed, five children and a man injured, by the wreck of an automobile against a stone embankment. The car was entirely demolished. This accident occurred while the car was descending a steep grade, and it is thought that the driver lost control of the machine and failed to keep it on the road.

Germans Building Cars.

Berliner Tageblatt, a German publication, calls attention to the great development of automobile building in Germany during the war. The machines now being built are, of course, mostly for war purposes, but it is claimed that the factories will be able to turn out commercial and passenger vehicles in large quantities after the war, both for domestic use and for export.

A New Gasoline Process.

A new process for extracting gasoline from crude petroleum, and said to yield about three times as great as any present process, is the claim of the inventor, Dr. A. H. Ramage. A company has been formed and will control the invention. The Boston Engineering Corp., which concern will have charge of the new process, includes men prominently connected with the automobile industry.

Mapping Truck Highways.

A pathfinding car has been started to map out feeder routes from manufacturing centers in Wisconsin, Illinois, Michigan, Indiana and Ohio to the two official highway routes from Detroit and Buffalo to the Atlantic seaboard, the pathfinder automobile of the Highways Transport Committee, Council of National Defence.

When the trip is completed the government will have four main highways forming connecting links between the great manufacturing centres of the country and the Atlantic seaboard. Motor transports on their way to France will follow these routes and carry cargoes to relieve freight congestion.

Interesting Kinks and Humorous Things Seen in Various Garages

BY JAMES F. HOBART, M. E.

If a man were to tell about all the interesting things in the garages of the United States he sure would have some job, for it would take most of his life just to run around and see the interesting things and leave but little time to write about them. Why, a man wouldn't even have time to sleep or eat! Reckon I don't want that job!

But, somehow, if a man keeps his eyes "wide open tight" he can see lots of things worth telling about, without taking very much time sight-seeing either. Oftentimes some of the things are seen while walking past a place, without even going inside.

Sidewalk Air Outlet.

One city garage was located on such a busy street that it was not allowed a gasoline pump on the sidewalk, or even a permanently connected hose for the traditional "free air." The matter was gotten around, however, by locating the gas pump inside and running the hose out of doors whenever a car took gasoline.

A "water box" was procured from the Department of Public Works and set in the sidewalk, close to the curb as shown by Fig. 1. A "water box" is merely a cast iron affair about six inches square, inside, and is used in some cities to enclose the water cut-off stem, which leads from the service pipe valve buried frost deep below the ground level. These boxes are fitted with covers as shown in the sketch. The hole in the bottom of the box was about three-quarters of an inch in diameter.

A ball-shaped flange was slipped over the air-tube, to which was fastened a self-closing nozzle for attachment to tire valves. The ball flange was fastened to nozzle in such a manner that the flange could not slip down the tube, then the tube was dropped through the hole in the bottom of the box as shown at A, Fig. 1.

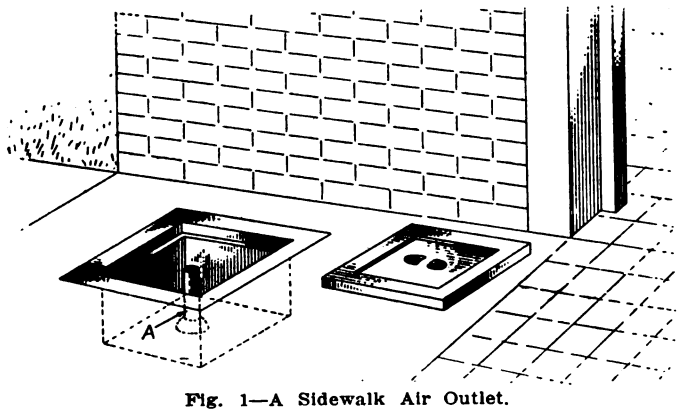

Fig. 1—A Sidewalk Air Outlet.

The tube was made in length equal to twice the depth of the cellar, into which the hole of the water box opened. A sheave, with guards on the side to prevent it from slipping off the tube, was slipped over the air tube, and the latter was then fastened to the air pipe.

When air was needed for a tire, the nozzle, A, Fig. 1, could be grasped and enough of the tube pulled out to reach the wheel with the tire to be filled. The sheave rode up on the tube, as the latter was drawn up and out, and in this manner nearly the whole length of the tube was available, the pulley and weight being able to ride right up to the ceiling. When the tire was filled, it was only necessary to let go of the air tube and it was drawn back into the cellar by the weight, in a manner similar to the disappearance of the flexible cord with which a telephone "Central" makes connection upon the switchboard. These cords are all weighted under the bench through which they project, and retract when dropped by the operator.

The air tube behaved in a similar manner, but the owner of the device advised that no more weight be used with the sheave than was absolutely necessary or the nozzle would eventually be torn from the tube by the repeated striking of the ball flange against the bottom of the "water box."

Humor in Garage Signs.

Some of the signs to be found in garages are surely right to the point, besides being occasionally excruciatingly funny. In one garage is a very conspicuous sign immediately over the work-bench, which reads:

"DON'T TAKE THESE TOOLS UNLESS YOU WANT TO DIE!"

Another garage has a tool cabinet with a place therein for each and every tool possessed by the garage in question. In order to keep "tabs" on the tools, a sign is displayed—and enforced—the writer was advised, as follows:

"EACH TOOL MUST BE RETURNED TO ITS PLACE EVERY SATURDAY NIGHT."

In a garage on Goodfellow Avenue of a certain town, I will not say which town for fear it may be that in which you reside, a sign is displayed which evidently had been written by someone "bothered to death and then some" by people who took things which did not belong to them. The sign was as follows:

NOTICE.

To whom it may concern:

If you want to take something, please take something worth taking, like the Piano or Pool Table or Clock. Please leave tools alone, as they are worth something to us and we need to use them once in a while!

Another man, this time up in the State of New Hampshire, was not as nice in his remarks, which were evidently directed toward the same acquisitive type of person; said remarks, however, were much more direct and emphatic. This notice read:

NOTICE.

The Lord helps the man who helps himself, but Lord help the man caught helping himself here!

Marking Inner Tubes for Patches.

It seems an easy matter to find all the leaks in inner tubes, simply by immersing the suspected tube

Digitized by Google

in water and noting where air issues therefrom. But some leaks will not be indicated unless certain precautions are taken. There is a great difference between the leak power of spongy rubber with an ounce or two of air-pressure inside and a tube with 100 pounds pressure. Therefore, if leaks are found upon inflating the tube after it has passed the water tank test, then do not condemn the method as "N. G.," but simply approach a little nearer actual working conditions and try again.

This means: Put a little more air pressure inside the tube and immerse again in the water tank and the slight leak will probably show itself better than it did with the lighter pressure. To be sure, inner tubes must not be over inflated, but you can safely put in pressure enough to stretch the tube to about double its size and by so doing make obscure leaks plainly visible.

One man, whom the writer watched, tested one tube three times, and worked a very neat scheme, something as shown by Fig. 2. The first time the tube was immersed a couple of leaks were found, but they were so small and obscure that it was suspected other leaks existed. While the workman was hunting for other leaks, he lost sight of those at B and C and consequently when he was ready to fit patches over the leaks, he had lost track of them and had to test the tube again to relocate the leaks B and C. The second test developed a small leak at D, and the workman surely had his hands full keeping track of the three leaks and in cutting patches of the right size and shape for them.

Used An Analine Pencil.

The workman sought patiently for the very faint lines which had been traced around the leaky places, then reached for his pencil to mark the breaks more plainly. But the stub of a pencil had disappeared. Before it could be sought for an expressman entered with a package and extended the book and inevitable analine pencil.

The workman had just relocated one of the leaks, and, taking book and pencil, he marked a rough circle on the tube, around the leak, with the analine pencil, dropped the tube and receipted for the package. When he took up the tube again, there was the plainest mark around that leak that could be imagined. The moisture on the tube had transformed the pencil marking into ink, which was found not to wash off easily upon subsequent immersions of the tube.

Here was something worth while; the workman gave it considerable thought, then procured an analine pencil of his own and a couple of clean wipe-cloths from the store room. Upon finding a leak, the workman roughly wiped off the superfluous water, then marked the tube, passing the pencil around the leak, so as to mark exactly the outlines of the patch required by that leak.

It was then a very easy matter to cut each patch to the shape marked out, and the workman found it very easy indeed, after that, to mark the leaks, and at the same time to draw an exact "map" of the patch required. This also made it easy, when putting on the patches, to tell "which one went where!"

It required a third test, with all the air pressure the workman dared use inside the tube, to find two more leaks at E and F. After these had been repaired, the tube held its air perfectly. This workman now wastes very little time in testing tubes the second time; he inflates them about up to the limit, so that if there be any slight leaks, they will make themselves evident. Then, with the "ink-pencil" the tube is marked for patches, in a manner which cannot be mistaken, and which has proved a time saver of many hours in the course of daily garage practice.

Fine Pre-Heating Hearth.

One garage—"Somewhere in Indiana"—which had put in oxy-acetylene welding apparatus a few years ago, so its manager said to the writer, had been greatly troubled to find some simple and ade-

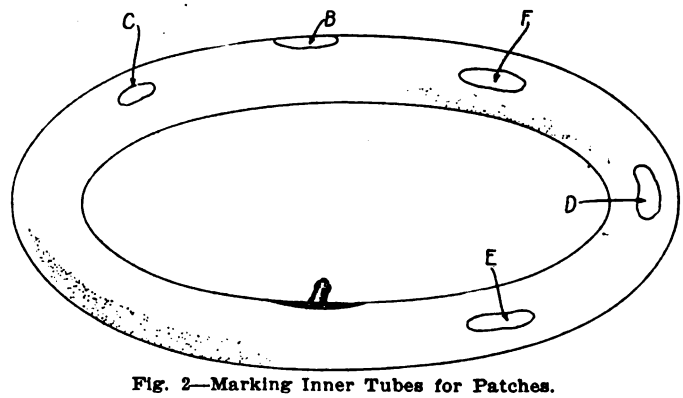

Fig. 2—Marking Inner Tubes for Patches.

quate way of preheating the hundred and one shapes and sizes of broken machine parts, which came in to be repaired. "In cold weather," the manager remarked, "small parts are preheated in the shop heating stove, being placed right on top of the fire and allowed to remain until sufficiently heated.

"But with large pieces it was different. The forge fire is the usual resort in such cases, and proves efficient but awkward, especially when, after being tied up for a job of heating requiring several hours, a rush order comes along for some forgings!

"In order to get rid of that inconvenience and delay, we put in the heating hearth shown herewith by Fig. 3. We took out the shop floor, filled in underneath with earth, spread six inches of sand on top of the earth filler, then paved with fire brick, leaving the latter so they projected about an inch above the wooden floor. In fact, we filled and rammed in sand just level with the underside of the double board floor of the shop. The fire-brick paving then projected as shown at G, H."

Floor Hearth for Preheating.

"The pieces to be heated were laid directly upon the paved hearth, blocked up thereupon as was found necessary, then rough brick walls were laid around the parts as shown at I, J and K, where three separate jobs are being heated at the same time. The bricks are laid up as closely as possible without any mortar or other substance for filling between them, then the walls are roughly levelled off on top and covered with pieces of sheet iron as shown at L, M and N.

"In laying up the bricks, which are merely for confining heat around the parts, openings are left in the walls as at P, P, Q, Q, through which are introduced the blast nozzles of oil heating torches, the hot blast from which eventually brings the broken parts to the required degree of heat.

"When placing the parts previous to heating them, they are so arranged that the welding may be commenced without removing the parts from their po-

Digitized by Google

sitions upon the hearth. As soon as the heating has been completed, a few bricks would be removed, or the sheet iron cover slipped aside a bit and the welding commenced, keeping the blast on if necessary.

"Yes, we made the heating hearth large enough for several jobs, and large enough also for the biggest job which is ever likely to come to us. We made the hearth twelve feet square, and it is none too large. In fact, if business keeps on increasing, and I don't see why it should not, as the number of cars in use is daily increasing, we shall put in another section of heating hearth of same size, and located directly adjoining the present hearth.

"Cutting with the oxy-acetylene torch? Sure, we do lots of it. We do a good deal of brazing with the torch, too. But for this purpose we often use the torch with air and acetylene instead of with oxygen and acetylene. It gives plenty of heat for brazing and is not as expensive as the oxygen."

An Automobile "Merry-go-'round!"

Here is a chance for some enterprising "Yankee" who may be on the lookout for a means of making a few dollars. The writer has often seen on the streets of the larger cities small "Merry-go-'rounds" which were built right into horse-drawn vehicles and the revolving seats operated by a man-driven crank. The music was supplied by a barrel organ, which in turn was worked by a boy. The operator of the outfit did the cranking of the revolving seats, took tickets and saw to it that no child got in the way of danger. He also drove the horse while the outfit was under way to new places, during which time the organ boy "fended-off" such enterprising urchins as tried to steal rides or to "hitch behind."

The writer looked the outfit over a bit carefully, with the idea that it could be profitably attached to a Ford or other low-priced car. There were seats for twelve children, the running time was one-half minute in one direction, then the motion was reversed and the seats revolved another half-minute in the other direction. After timing the outfit for nearly half an hour, it was found—the cost of the ride was

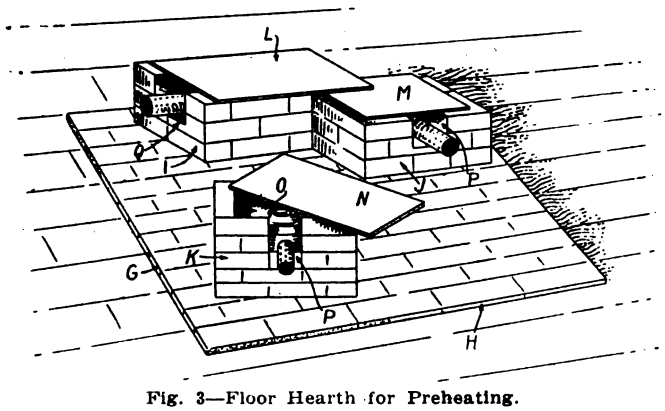

Fig. 3—Floor Hearth for Preheating.

one cent—that during the half hour of observation ten "trips" were made, and only once or twice were the seats not all filled; one "ride" carrying eleven children, another trip ten, all the others, eight of them, having every seat filled.

This averaged a trip each three minutes, and the proceeds of the half hour amounted to $1.17, with a possible $1.20. Pretty good revenue for a horse, a man, a boy and $100 worth of old wagon and revolving seats? Many a good car is rented out for $2.00 per hour and often stands at the curb idle half the time, waiting for passengers. Therefore, it seems to the writer that a very profitable investment for a man inclined to the show business would be to build upon a Ford car a merry-go-'round which would seat 20 children. The engine of the vehicle being made to do the work of propelling the vehicle. driving the revolving seats, operating the organ—though a piano or "hurdy-gurdy" would be better—thus leaving the man free from the crank work and able to give his undivided attention to collecting fares, watching for "Safety First," and properly "Barking" the show. He would be relieved of the expense of the horse and of the boy, and would also be relieved from the crank work, which in itself is no small task.

He could, by selling tickets while a "ride" was going on, have another load all ready for a trip, twenty of them, when business was good, and he might possibly lengthen the ride to two minutes and still make ten trips per half hour, using one minute for unloading and loading again. This would give a possible $2.00 per half hour, $4.00 per hour as a maximum possibility in the earning power of the outfit, with only one man and a Ford engine to keep in operation, and, by introducing an innovation and double-decking the ring of 20 seats, the earning capacity of the outfit could be increased to a maximum possibility of $8.00 per hour! Worth looking into, isn't it?

Stuck in the Snow.

The writer chanced to be in Memphis, Tenn., about the first of December, 1917. Was there when the mercury dropped clear to zero, and ten inches of snow dropped with it in a single night, and if ever anything was paralyzed by snow and cold, it was the automobile business of Memphis. They don't have such weather there very often, and when it does come they don't know what to do with it, so it "does them!"

Within radius of a block from my room on Court Street the morning after the storm I counted thirty abandoned cars. I enjoyed many a quiet laugh while watching little converted service cars trying to pull big automobiles out of alleys and along the slippery, snow-clogged streets.

The converted cars didn't know how to do it, and the drivers were equally "green." The number of tow-ropes broken that day in Memphis must have been something large. One little converted Universal Motor Runabout in particular buzzed around like a veritable wasp. The driver would make a hitch to an abandoned, frozen car and try to pull it. Instead of going somewhere and loading the body of his car with pig-iron or sand, so as to get some traction power, the driver made a hitch and pulled time after time while the chains on his car wheels as they spun around cut the snow like buzz-saws. Then the driver tried backing away and "jerking" on the rope. This resulted, as it must have done. in breaking the rope as fast as he could tie it.

Then he tried pushing the dead car, with no better results, and then went away after a heavier car to pull with. Just after he left, a friend of the "abandoned" owner came along with a heavy car, took the dead car in tow and vanished. There was quite a tableau when the driver of the little "wasp" returned with a heavy truck and there was no abandoned car to be found!

Difficulties Encountered in Using Present Day Gasoline and Heavy Fuels

A Non-Technical Analysis of Troubles Arising From the Use of Fuels With High Vaporizing Points in Gasoline Engines of the Older Types

Though the average automobilist realizes that a lot of his engine troubles are due to heavy fuel, he does not know just why present-day gasoline will not give as great mileage as did that liquid, with the same name, in days gone by. It is the purpose of this article to make the matter clear to the reader.

It is a well-known fact that kerosene contains more heat units per measured quantity than does an equal amount of gasoline, and heat units may be considered in this case as being power units. As gasoline grows heavier it contains more of the kerosene element, and present day fuel contains a large percentage of kerosene with a very small percentage of actual gasoline.

Greater Mileage.

We may assume, then, that the present fuel should give greater car mileage per gallon than gasoline, a fact that does not seem to be true from actual experience. The answer to this peculiar question is that the carburetor cannot take care of all the fuel and bring it to its vaporizing point.

Engine power is greatly dependent upon the force and speed of the explosions in the cylinders. If the gas in the cylinders burns slowly, the expansion takes place gradually and the engine will have no "pep," to use a universally accepted expression.

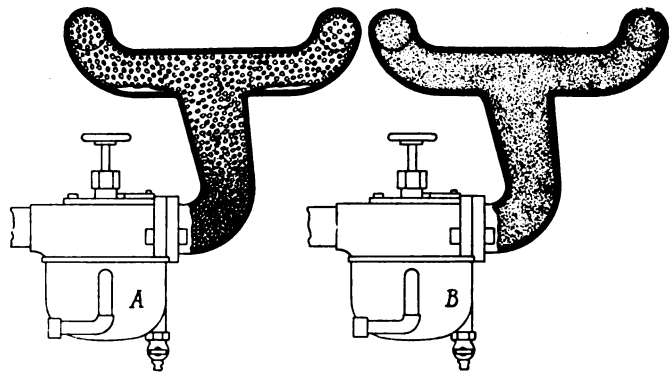
The mixture of gasoline and air in the cylinders may be likened to a mixture of gunpowder and sand. If one were to mix some very fine sand with a quantity of very fine gunpowder and touch a match to the mixture, chances are that the whole mass would explode quickly, for the fire would leap from one granule of the powder to another. If the powder were extremely fine, the action would be quicker, for the mixture would be better.

Suppose, however, that instead of using fine gunpowder, one were to try the same experiment with extremely large pieces. Perhaps one of the pieces could be lighted, and would burn briskly, but the flame would not pass to all of the other fragments, and so much of the powder would remain unconsumed. In any event there would be no explosion.

The fine gunpowder and sand mixture may be likened to a well gasified fuel, while the second mixture could be compared with a poorly carbureted gasoline. Engineers term such mixtures, dry and wet respectively.

At A, in the accompanying illustration, is shown the intake manifold through which a wet mixture is passing. One will note that the fuel is in the form of drops and that all of it is not mixed with the air. The gasoline at the center of the drops will not have time to explode in the engine and will be driven out of the exhaust or condense upon the cylinder walls, resulting in a great loss of efficiency.

Another point to note in this illustration at A, is that the wet mixture has a tendency to condense in the manifold, particularly at the inside of the bends where the velocity of the passing gas is not great. This fuel will gradually "load up" until it overflows, so to speak, and when the engine is speeded up quickly it will be drawn into the cylinders in its liquid state, quenching the explosion flame, and decreasing the engine power.



The Dry Mixture.

At B is shown a dry mixture passing through the manifold. In this case the fuel and air are properly mixed and the explosion will be sharp and quick. Each little molecule of the liquid carries its proportion of air, and in itself is explosive. Being in a finely divided state, it will not condense upon the manifold or cylinder walls so quickly as would a wet mixture, and so it may be said to be efficient.

Now gasoline is very much like water in one respect, when heated it gives off a wet vapor; as the heat increases the vapor expands and, like superheated steam, is dry and resists condensation. Working upon this fact, engineers have arrived at the conclusion that the real solution of the heavy fuel problem lies in the proper application of heat to the fuel.

To secure any degree of efficiency from his engine, every operator should look to the carburetor hot air connection and be sure that it is not obstructed with dirt or carbon. If he is using one of the combination exhaust and intake manifolds which are obtainable in many designs, he will probably find that he is getting good mileage, for in this case the fuel drops are superheated before entering the cylinders.

The second problem that often arises when one is using the present heavy fuel is the high compression factor. As everyone knows, any liquid is compressible only to a very limited degree; it is one

Illustrating at A, Wet Mixture; at B, Dry Mixture, in Manifold.

of the reasons why water is used in the hydraulic press, and why oil is used in the well-known door-check.

As vapors or gases increase in liquid content, their compressibility decreases. In the old grade of gasoline the vapor was compressible to a great extent and engines were designed to have cylinder compression of from 65 to 100 pounds per square inch, and in many cases higher.

With the heavier fuel, however, the gas could not

Digitized by Google

be put under such pressure with satisfactory results and the average cylinder compression is below 65 pounds.

Bearing these facts in mind, one can see just what will happen when one of the old type engines, a 1910 model for instance, is used. In many cases the firing chamber will be too small to hold the volume of gas taken in on the suction stroke, and the piston will come up against what might be almost a solid body of liquid fuel, resulting in a decided knock.

Should the piston rings be poorly or loosely fitted, the fuel will be forced past the piston and into the lubricant in the base. This is why an old, overhauled engine causes trouble in many instances from burned out bearings due to diluted lubricating oil.

Should an overhauled engine of old design evidence any of these troubles, it should be inspected carefully, the compression taken, and if too high the piston heads turned off slightly, the firing chamber enlarged, or the cylinder head gasketed a little higher than normal.

One should observe the utmost care and keep the lubricant in the base to its maximum efficiency and as soon as it begins to show dilution it should be drained and new oil put in.

ADJUSTING PINION GEARS.

Correct Methods to Be Used in Re-assembling the Differential.

BY GEORGE A. LUERS.

Many owners are surprised, after re-assembling the rear axle, in which worn bushings are replaced and possibly new gears installed, that after two or three hundred miles of running, broken edges of gear teeth are found in the grease. The first evidence of trouble is an unusual thump in the rear axle when the car is started. The lubricant, being stiff, picks up the gear particles, and these revolve between the teeth of the meshed gears.

This trouble is the result of improperly meshed gears, which is the direct cause of the most trouble in an overhauled axle. A brief outline of the construction of the gears will give the amateur repairman an idea as to the reason for the correct meshing of these parts, in order for them to transmit the engine power, without crumbling and breaking at the edges.

Gear Construction.

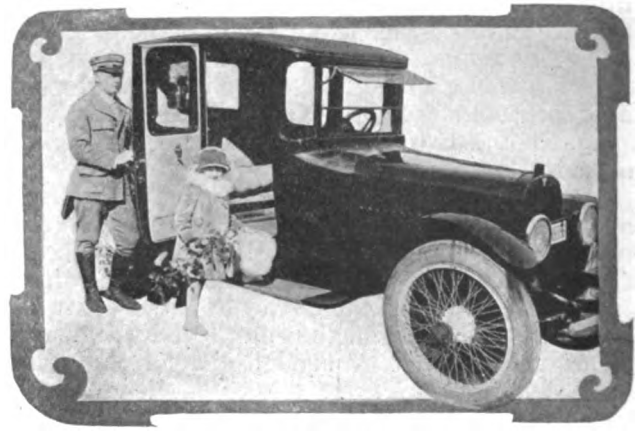
A gear tooth of the straight bevel, or spiral bevel type, is of a different width at every point of its length, tapering so that the sides of the tooth, if extended to that point, would meet at the exact center of the shaft. The teeth of the large and small gears are of the same size at the extreme outside of the tooth. They are measured off at this place on the uncut gear blank and shaped on the gear cutter so that the tooth sides of the meshing gears will intersect at the point where the centers of the shafts on which the gears are fastened cross.

Considering the accurate machinery necessary to shape the teeth, with the extreme outside ends as a guide, the gears can only be correctly meshed when these outside ends of the teeth on the two gears are flush, since this gives a contact area, as intended, extending the whole length of the tooth side.

If the tooth ends overlap, as they frequently do, the engine power is transmitted by the extreme outside ends of the teeth at one point of contact only, and this condition results in the breaking of the tooth edges. The teeth are case hardened and the surfaces will not give as would softer metal, for the hardened surface is brittle and crumbles when the pressure is not evenly distributed.

Making the Adjustment.

A differential housing with a removable plate at the rear permits making the adjustment of the gears, either by placing the hand inside the case to feel if the tooth ends are flush, or inspection, using a small dentist's mirror and a flash lamp. On a housing, not fitted with a detachable plate, such as the Ford, the gears should be adjusted to mesh properly, by bolting the driving shaft housing to the left axle housing, with the gears in place, leaving the right side of the housing off. This permits close inspection to see that the gear teeth are flush. Adjustment of the bearing can be made with washers or shims to bring the gear teeth even.



The next procedure is to obtain proper working clearance between the teeth, which should be from .001 to .0015 of an inch apart to allow for expansion, due to slight heating of the parts in operation and for an oil film between the surfaces. The clearance may be found simply by using thin tissue paper or cigarette paper. When the gears can just be revolved by hand, with the paper between the engaging faces of the gear teeth, the gears are the proper distance apart.

Test the large or ring gear at several points and be certain that it does not bind at any place. If the gears mesh deeper at one place than at another the bolting face of the large gear is not true, or the end of the drive shaft is sprung. Either fault should be corrected.

The short time required to make this adjustment is well spent, for, properly made, the axle gears will give good service only if properly adjusted.

Cars Increase in Wisconsin.

Wisconsin dealers are not downhearted and anticipate a big season despite war conditions. The registration figures show that the Wisconsin dealers sold nearly 49,000 cars in 1917, or a gain of nearly 42 per cent. over the previous year. In 1917 there were 164,531 cars registered against 112,637 of the previous year. It is estimated that there is a car to about every 17 persons. There are 2,167 dealers.

Interesting and Time Saving Devices Seen at the Boston Automobile Show

The Boston Show, this year, opened in what might be well termed "a blaze of glory" and though the exhibits were, as a general rule, very similar to those of last year, there were many that attracted much attention.

The general layout of the floors was similar to that of last year, the main floor being devoted to passenger car exhibits, the basement to motor trucks, and the second floor and balconies to accessories.

"Conservation" seemed to be the keynote of the whole show; the salesmen of cars talked high car mileage, truck manufacturers talked low upkeep costs, while the accessories for increasing car mileage and obtaining maximum efficiency were great in number.

Despite the fact that this year promises to be one wherein the "Used Car" will be in its glory, because of the decreased car production, there was little or no apparent falling off of the new car exhibits. The main floor was attractively trimmed and the exhibits were well arranged in harmony with the decorations.

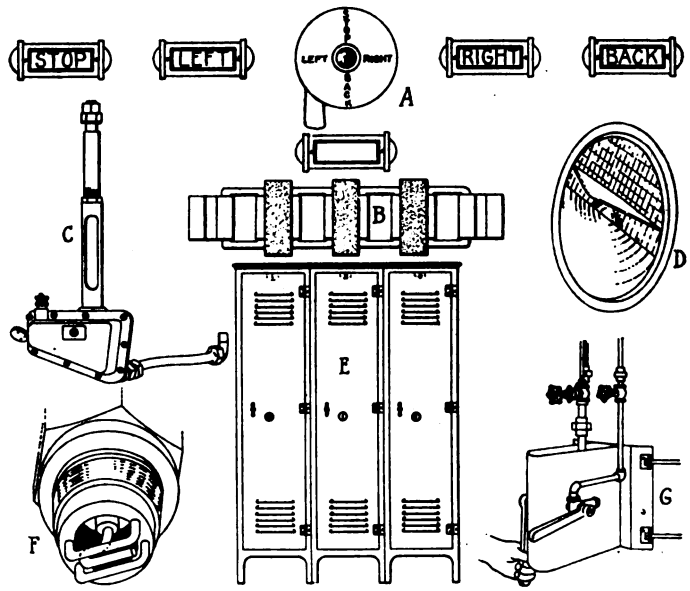
Due to the fact that there will be many old cars kept in service, interest seemed to center around the accessory displays on the second floor. Every accessory that one might imagine had its place and one might, with judicious buying, equip his car with devices enough to put it into the same class with a new car.

In the accessory department might be found many handy tools for the repair man; devices which would enable him to do better work in less time than he might with old equipment or by hand. A trip to the show might well have been considered as an educational tour.

It would be manifestly impossible to check up with detail the interesting accessories shown and it is our intention to give a brief description of those which seem to attract the most interest and make for most efficiency.

The Roedding Signal.

One of the exhibits which might be said to be interesting, from a humanitarian standpoint, was that of the Roedding signal, shown by K. G. Barkoot of Detroit, Mich. This device, illustrated at A, was designed first to prevent rear-end collisions and second to facilitate traffic. Upon the steering wheel was mounted the control dial having the four marks, stop, left, right and back.



At the rear of the car was provided a tail light, one end of which was fitted with a white glass for illuminating the number, the other end with a green lens. The driver had only to turn the disk to the desired location and press the button when the proper signal would be shown upon the red glass at the rear. Being wholly operated from the seat, the device is simple and should prove of great value to the present day automobile owner doing more or less traveling through the cities.

Crowe Fan Belt.

Considerable interest centered around the exhibit of E. L. Thompson Co., 817 Boylston street, Boston, Mass., who represented the Crowe mechanical fan belt. This product is applicable to practically any engine device requiring a light belt drive and consists primarily of but three pieces, a solid steel link, a wire link and a leather friction block. With these three units, the belt may be built to practically any length as shown at B.

Mack Safety Oil Gauge.

Ford owners who had been troubled during the past by engine lubrication were particularly pleased by the exhibit of the Mack Safety Oil Gauge Co., 14 State street, Boston, Mass. This oil gauge is designed to attach to the lowest portion of the Ford oiling system, beneath the flywheel, and consists of a glass indicator and a special electrical device connected with the ignition circuit. If for any reason

Interesting Accessories at the Boston Show. A, The Roedding Signal Outfit; B, Crowe Fan Belt; C, Mack Automatic Safety Oil Gauge; D, Holophane Headlight Lens; E, Hart & Hutchinson Locker; F, National Spark Plug; G, Pneumatic Garage Door Control.

the lubricant should fall below its proper level, the engine immediately becomes inoperative.

Holophane Lens.

There were scores of various headlight lenses in evidence at the different booths, but none attracted more attention than did the Holophane, which was exhibited by the distributors, Wetmore-Savage Co., 76 Pearl street, Boston, Mass. By referring to sketch D one will get a general idea as to the design of this lens. The upper portion is made up of a number of prisms in a checker board effect. At the center is a bull's-eye arrangement, while the lower part is cut by a number of semi-circular corrugations. Projecting from a line slightly above the center is a translucent fin, which is designed to filter the direct rays of light and prevent them from dazzling the eyes of an approaching driver. It is claimed that this lens complies with the various headlight laws throughout the country.

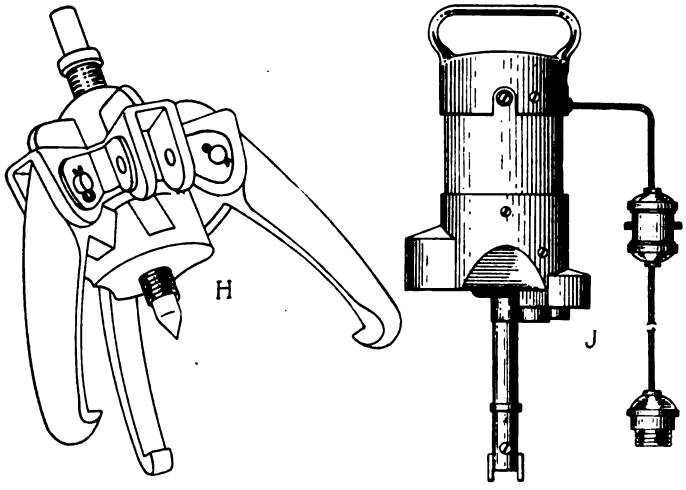
All Steel Lockers.

Garage owners are beginning to realize that in order to keep their men satisfied with the work

Digitized by Google

they must provide suitable accommodations for the workman's clothes. All-steel lockers exhibited by the Hart & Hutchinson Co., New Britain, Conn., were attractive, and from the garage man's standpoint the type B-C single-tier locker was perhaps the most practical. This locker is made of heavy steel reinforced and so designed that it may be used singly or combined with any number of units. Each locker is provided with a heavy door which may be had ventilated at the top or bottom, or fully ventilated throughout its length. Each door is provided also with a special key. A three-locker combination is illustrated in our sketch at E.

National Spark Plug.



Something distinctly new in the line of spark plugs was exhibited by the Bergie National Spark Plug Co., Rockford, Ill. This plug has two large electrodes connected with the base casting. Between the two electrodes is the third or center insulated terminal, so arranged as to present approximately one inch of firing surface in the cylinder. The firing end is illustrated at F.

Pneumatic Door Control.

Among the exhibits which might be said to make for comfort was that of the Foss-Hughes Company, Market street, Philadelphia, and called the pneumatic control for garage doors. This control is a device for operating any type or size of swinging, folding or rolling doors and may be placed at practically any part of the building. Through the control box compressed air is released from and injected into a cylinder, which then automatically opens or closes the doors. The main control may be augmented by as many other controls as desired. One of the many advantages claimed for this sort of device is the conservation of the heating through the quick opening and closing of doors, thereby preventing drafts and permitting the building to be kept heated uniformly.

Beach Grip Puller.

The Greb Company, 172 State street, Boston, Mass., drew the attention of many repairmen by their Beach automatic grip puller. This device consisted mainly of a large heavy body casting, fitted with four lugs into which might be placed large hooked jaws. Sliding in the large casting was the center member which carried the pressure screw. The center member was slotted to receive projections on the jaws. In operation, pressure upon the screw presses the center sliding member in the casing and automatically brings the jaws toward their common center. The greater the pressure the tighter the jaws hug the piece. The device is arranged to take either three or four jaws. A locking lever at the top is arranged to hold the center sliding member in place. A good idea of how this device looked may be obtained from glancing at sketch H.

Two New Tools at the Show. H, Beach Automatic Grip Puller; J, Stenman Electric Valve Grinder.

Stenman Electric Valve Grinder.

Garage owners who were on the lookout for time-saving devices, were attracted to the booth of C. W. Frohock, 493 Park avenue, Boston, who represented the Stenman Electric Valve Grinder. This machine is designed to operate from the lighting circuit and is so made that the grinding shaft, upon which the valve tool is mounted, has an oscillating motion, rather than purely rotary.

With this device, illustrated at J, it is claimed a mechanic may grind valves in one-quarter of the time ordinarily taken by the old hand method. The shaft is designed with removable valve tool heads, and any type of valve may be ground with the outfit.

THE THIRD LIBERTY LOAN.

Perhaps no industry should be more grateful to the Government at this time than that of the automobile. This branch of work has been benefited by war contracts, and it is only natural that the Government should look to the automobile industry to do their part in the third Liberty Loan campaign which will open on or about April 6th, the first anniversary of our entry into the war.

The large cities will follow out the same general lines of canvassing this year as were pursued in both the previous loans. That is, the Liberty Loan committees in each metropolis will appoint a committee chairman for each industrial committee. This chairman will choose several associates. Bond salesmen and speakers will be furnished by a central speakers' bureau. Then, as a separate and individual working unit, the industry will solicit subscriptions from members of the trade.

Last fall, nearly $5,500,000 was raised in this way among automobile men in the Second Federal Reserve District with headquarters in New York. Other large cities made correspondingly good returns.

The ever-increasing expenses of financing the war make it imperative that the Third Liberty Loan shall be oversubscribed by many millions of dollars. The war budget has increased at the rate of $100,000,000 a month for the past three months.

With a second draft army to be clothed, fed and equipped, more and more money will be needed constantly. This money must be provided by the people. Our total outlay in money during the first ten months of the war was $7,100,000,000. Of this sum $4,000,000,000 went to England and France in loans. Announcement of further loans to our allies is expected daily.

Strange to say, figures show that, in spite of this seemingly heavy drain, we have not as yet scratched the surface of our national resources. Two and eight-tenths per cent. represents all that we have spent at war so far. Germany's total war costs to date are estimated to have consumed 33 1/3 per

Digitized by Google

cent. of her total resources. These figures indicate the distinct advantage that we would hold over our adversary in the event of a long, drawn out struggle.

One important reason for piling up vast stores of money now is to have a reserve on hand to meet Germany's spring and summer drives. All during the winter she kept rolling up her heavy caliber guns to the western front. At the same time, hundreds of thousands of men were released from the Russian frontier. They were hurried across the continent. Hindenburg, Ludendorf and the other German war lords realize that they have got to "show the German people something" if they expect further sacrifices in blood and money. A big gain over the French and English would cheer up the discontented army of workers at home. A setback would so arouse antagonism among the masses that further fighting would be impossible. The Socialist influence, alone, would compel the Kaiser to sue for peace.

So that is why the coming loan must "go over," and go over big. It is not an exaggeration to say that the success of the war hinges upon this loan. Banks and employers will again make easy the purchase of bonds by men and women of moderate means. Only a small initial payment is necessary to secure a $100 or $200 bond. Weekly instalments will do the rest.

Many men and women, who ordinarily bank a stipulated sum each month, are now laying away half the amount for Liberty Bonds. All sorts and manners of sacrifices by loyal Americans have been reported.

A feature of the coming campaign is the vast amount of advertising matter that has been prepared. Every city and town throughout the nation will be painted red, white and blue by April 6 next. Over 9,000,000 posters by some of the most famous artists in the land have been scattered broadcast. Thousands of folders, circulars and pamphlets have already been mailed. Painted signs will appear over night on house tops, offices and sub-treasury buildings. Banks, too, will glisten with enormous signs.

NEW BOOKS RECEIVED.

Acknowledgment is made of the following books and house publications:

The Gas Motor. By Max Kushlan, B. S., Assoc. M. W. S. E. A well written book dealing with the principles of gasoline engines and automobiles. Very non-technical and written so that the layman should have but little trouble in understanding it. Published by The Branch Publishing Co., of Chicago, Ill.

Upholstery and Top Materials. Du Pont Fabrikoid Co., Inc., Wilmington, Del. A booklet dealing with the three grades of Fabrikoid used on passenger and commercial cars. Interesting facts in connection with the manufacture and uses of the products, Motor Quality, Truck Special, and Rayntite, are given. Copies may be had by writing the office of the company.

Concrete Highway Magazine. Published by Portland Cement Association, 111 West Washington St., Chicago. An interesting book devoted to concrete roads, well illustrated and containing much information. Price 50 cents the year.

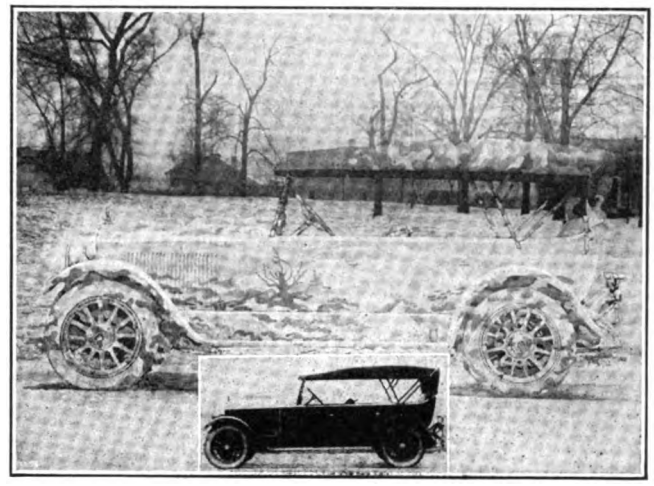
Aviation Engines. By Lieut. Victor W. Page. A very exhaustive treatise on aviation engines and covering the various types in use. As a source of information this book should be valuable to anyone interested in airplane work. Published by The Norman W. Henley Publishing Co., Putnam Building, New York. Price, $3.00.

Location of Aviation Power Plant Troubles Made Easy. By Lieut. Victor W. Page. This is a large wall chart, showing a typical airplane power plant in part section and all important components. Tables giving an outline of possible troubles are printed upon the chart. Published by The Norman W. Henley Publishing Co., Putnam Building, New York. Price, 50 cents.

Reo Truck News. House organ published by the Reo Motor Car Co. of Lansing, Mich. Sent upon application.

The Truck-Smith. House organ published by the Smith Motor Truck Corporation, Chicago, Ill. Price, $1.00 a year.

Drill Chips. A booklet containing many well put facts about present day business. Published by The Cleveland Twist Drill Co., Cleveland, Ohio, and distributed upon request to the trade.



Milestones. House organ of the Firestone Tire and Rubber Co., of Akron, Ohio. 50 cents a year.

CAR CAMOUFLAGE.

An Interesting Instance of Deceptive Automobile Painting.

The deceptive coloration of the implements of war has become one of the most vital elements of the present great conflict. All manner of illusions have been practiced to deceive the eyes of the enemy.

Motor trucks, tanks, machine guns, bridges, roads —even the soldiers themselves—have been camou-

An Interesting Instance of Automobile Camouflage.

flaged, as they call it, to say nothing of the battleships and airplanes that without exception are so decorated as to render detection next to impossible.

Wondering how far this new art might be carried, several of the men in the paint shop of the Cole Motor Car Company at Indianapolis secured the permission of J. J. Cole, president of the company, to camouflage one of the new Cole Aero-Eights.

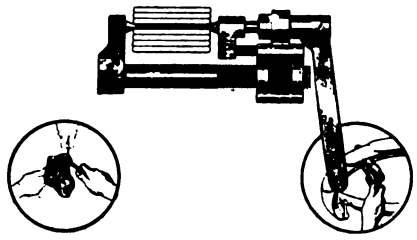
The result is shown herewith. In the small panel at the bottom is a photograph of the car before being camouflaged. The larger picture shows the car after receiving its coat of protective coloring.

The task was rendered exceedingly difficult because of the fact that the Aero-Eight had to be camouflaged against a landscape of snow. However, the result appears to have been very successful.

Motor Car an Essential.

The Montreal Automobile Trade Association has offered prizes to public school children under the age of 15 for essays on the subject, "Why the Motor Car Is an Essential." It is expected that the contest, which is being carried into all of the schools, will cause the children to ask questions of their parents, thereby bringing their attention to the fact that the motor car is one of Canada's most essential articles.

Manning, Splitdorf Sales Manager.



F. C. Manning, well and favorably known in the automobile industry and prominently identified in the electrical ignition business, has been appointed general sales manager of the Splitdorf Electrical Co., Newark, N. J. He will make his headquarters at the main office and will retain his presidency of the Sumter Electrical Co., a subsidiary of the Splitdorf Co.

Digitized by Google

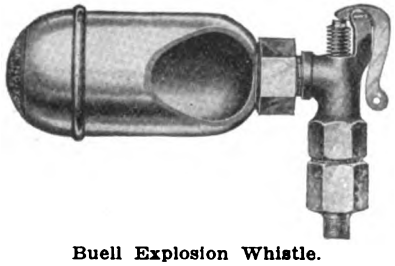
NEW AND INTERESTING THINGS IN MOTORDOM

Weise Leaf Spring Spreader.

Every motorist knows, or should know, the value of spring lubrication. Perfectly lubricated springs give that resilient action characteristic of high class cars; poor lubricated, they often rust into a mass of solid iron and do not function at all. The Weise Leaf Spring Spreader, manufactured by A. F. Weise, 133 W. Washington street, Chicago, Ill., is a handy little tool designed to be used for spreading apart the spring leaves. It is provided with two adjustments, a slow feed for ordinary purposes, and a rapid lever action. The device is made to take in springs varying from 1½ to 2¾ inches in width. The device is used as follows: The slow speed knurled nut is turned until the two jaws can be slipped over the spring with the lever

Weise Leaf Spring Spreader Applied.

extended. With the jaws against the groove between the leaves, the lever is pressed downward, driving the jaws between the leaves and permitting the insertion of graphite or other spring lubricant.



Buell Explosion Whistle.

The need for an effective warning device for motor cars and trucks was never so apparent as to-day. Daily accounts of accidents to pedestrians and property emphasize this fact and has resulted in a great number of warning signals being offered to the public.

One of the most effective devices so far presented is the Buell Explosion Whistle, manufactured by the Buell Manufacturing Company, 1610 Michigan avenue, Chicago.

This whistle is the invention of Mr. Buell and is claimed by him to be without an equal in certainty of service and long life. The Buell Explosion Whistle is first of all not a horn, but an actual whistle which screws on the motor in place of priming cap and is blown by the direct explosion, pressure of which ranges from 250 to 300 pounds to the square inch, thus securing certain and efficient operation at all times.

Being constructed of strong metal the

Buell Explosion Whistle.

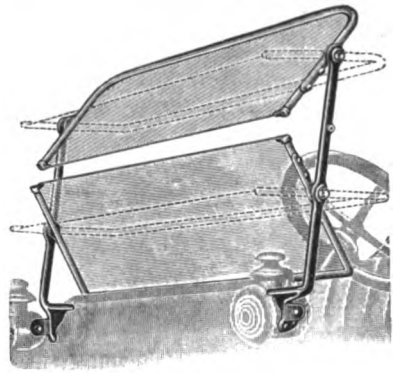
Buell Explosion Whistle is practically indestructible and will outlive any car. It never requires cleaning or attention of any kind.

Mr. Buell reports that at the present time 25 of America's largest manufacturers of automobiles and motor trucks are utilizing the Buell as standard or optional equipment on their cars.

One Minute Swivel Repair Link.

A combined swivel and chin repair link (patented) is the unique invention re-

One Minute Swivel Repair Link.



cently placed on the market by the Cleveland Galvanizing Works Co., of Cleveland, Ohio.

Although it has been on the market but a short time, the One-Minute Swivel Repair Link, as it is called, has found considerable favor among chain users because of its versatility, strength and simplicity, being constructed of but three parts, which can be put in place in the chain with a hammer, pair of pliers or a vise. It may be used with welded, weldless, or flat link chain and is furnished in three sizes for use with the different sizes of chain.

An interesting folder has been issued, describing and illustrating the repair link, copy of which can be had by writing the manufacturers.

Ospeco Ventilating Windshield.

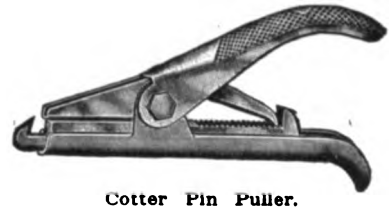
Now that summer is at hand the regular Ford windshield does not fully an-

Application of Ospeco Windshield Parts.

swer the purpose, for it does not permit sufficient ventilation for keeping the lower part of the automobile body cool.

The Michigan Auto Products Co., Department F, Ford Bldg., Detroit, Mich., manufacture what they term as Ospeco windshield parts, consisting of two heavy brackets which attach to the front section of the Ford body and carry the regular Ford windshield in such a way that the two halves may be tipped in practically any direction as shown in the accompanying illustration.

Krom-Nik Gears.



For many purposes the present Ford Gear Ratio is not entirely suitable. This is especially true of Ford cars used for heavy duty service where a lower ratio is desirable.

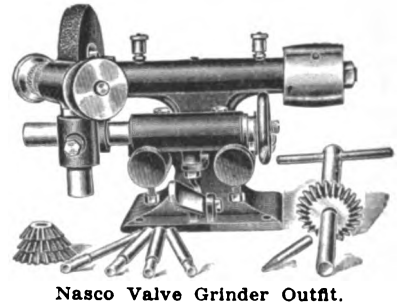
The Krom-Nik Gear Company, 910 Michigan avenue, Chicago, Ill., manufacture a pinion and Master Gear outfit applicable to the Ford differential which gives a ratio of 4.2 to 1, which is said to be the lowest gear reduction possible in a Ford axle.

Should one desire a racing gear the same company manufacture a 3 to 1 ratio outfit.

Cotter Pin Puller.

The average mechanic realizes the great loss of time in removing cotter pins from inaccessible places and knows that the screwdriver or bent nail method is far from efficient. A device has recently been put on the market by the Brewer-Titchener Corporation of Cortland, N. Y., which is designed for removing cotter pins. In general appear-

Cotter Pin Puller.



ance it resembles the ordinary conductor's punch, but upon the jaw end is a small hook which is inserted in the cotter pin eye. The pressure upon the handle pulls the cotter pin from its place.

Double Service Tires.

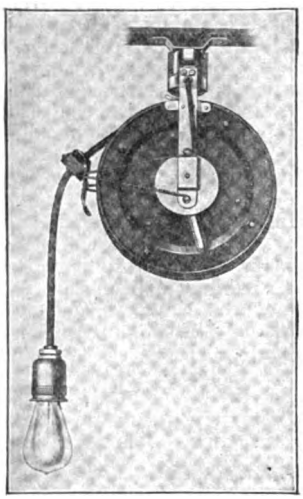
I. Jaffess, with stores at 1319A Fifth avenue and 241 West 54th street, New York City, announces a double service tire consisting of two standard make tires bound together in such a manner that each adds strength to the other. These tires are said to give at least 6,500 miles of wear and are being introduced to many automobile owners throughout the country.

Nasco Valve Grinder.

To give satisfactory results, engine valves must be kept in condition, and so require frequent grinding. Every machinist who has had occasion to reface hard steel valves realizes that this work cannot be done satisfactorily on a lathe, but requires a grinding wheel. The Nasco Valve Grinder, made by the National Auto Specialty Mfg. Co., of Tama, Iowa, is designed in such a way that valves of practically any size may be resurfaced. This machine is driven by belt and fitted with a fine emery wheel, set at right angles to the valve holding device. With the refacing tool may be

Nasco Valve Grinder Outfit.

had four reseating cutters and suitable guides for repairing the valve seats.



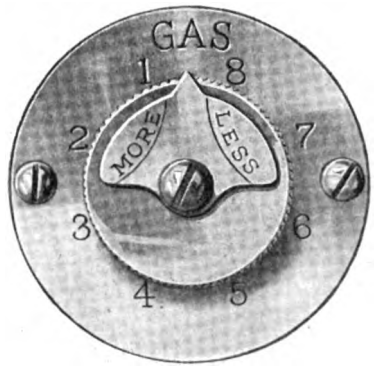
Digitized by Google

Gill Piston Rings.

The Government's action in restricting the production of automobiles and the utilization of some of the factories for war work, means that many old cars, which formerly would have been sent to the scrap heap, will this year be overhauled and used again. Nearly all repairmen realize that the so-termed "leak-proof" ring is superior to the diagonal cut one, and are installing such rings in all overhauled cars. The Gill piston ring is one of the leak-proof type and is a simple self-fitting, one-piece ring of sturdy construction. The unique construction of the joint is said to double compression, thereby saving gasoline and oil and adding power to the engine. This ring is made by the Gill Manufacturing Co. of 350 West 59th street, Chicago, Ill., in sizes to fit practically any standard engine, and in oversizes for rebored cylinders.

Automatic Extension Reel.

This device should be of great interest to the machinist or garageman who has occasion to use an extension lamp for work on machines. It consists of a nine-inch drum upon which is wound 25 feet



Automatic Extension Reel.

of reinforced cord with suitable connections. The reel is mounted upon a swivel ceiling bracket and can be turned in any direction. In order to operate the device, the lamp is grasped and pulled out in any direction to the desired distance. When this point has been reached, the lamp is slowly dropped back a few inches, when a ratchet on the drum catches and prevents further rewinding. The whole action is comparable with the ordinary window shade attachment, and is desirable because it keeps the flexible lamp cord away from the floor and prevents the attendant wear of the insulation. The device is manufactured by the Cincinnati Specialty Mfg. Co., of Cincinnati, Ohio.

Standard Carburetor Control.

Every driver of an automobile realizes the importance of the gasoline control, for he knows that if properly controlled his carburetor will give its maximum mileage.

The Ford needle valve adjustment on the dash is not very accessible and is often neglected. The Standard Carburetor Control manufactured by the Standard Thermometer Company, 65 Shirley street, Boston, is a device consisting of an instrument board indicator and a shaft connection. The indicator dial is divided into a number of points and fitted with a knurled knob. For starting the engine, the knob is

Standard Carburetor Control Indicator.

turned toward the left, giving more fuel. As the engine warms up the knob may be turned toward the right, cutting down on the gasoline and allowing the engine to be operated at its maximum efficiency.

Yankee Tap Wrench.

No branch of mechanics presents so many extraordinary and difficult jobs, in "hard-to-get-at" places, as automobile repairing. For this reason automobile tools must be "ingenious," and it is said that the "Yankee" tap wrench is of this kind. This device is manufactured by North Bros. Mfg. Co., of Philadelphia, Pa., and is designed to enable the largest possible number of movements or adaptations, with the fewest possible interruptions or removals from the work. The upper end is fitted with a sliding cross-bar, which is held central or at either end by a friction device. This feature, together with the right and left ratchet and rigid attachment, makes almost any job possible. The sliding ratchet shifter on the barrel is controlled at a finger touch, while the knurled thumb-piece at the top makes tap-starting easy, and also enables rapid backing out at the finish. The countersunk top of the thumb-piece permits the tool to be accurately centered on a lathe for tapping, or even for holding small drills. The Yankee tap wrench comes in three sizes.

Tire Doh.

The average motorist has begun to realize that tire mileage can be increased greatly by careful attention to the tires. Oil and water, two liquids which do more

The Tire Doh Outfit.

damage than actual wear, must be kept from the tire fabric or disintegration will be rapid. Tire Doh, a product sold by Atlas Auto Supply Co., 616 W. Austin avenue, Chicago, Ill., can be used for tire or tube repairs and comes in an attractive box with full directions. To promote sales and co-operate with dealers, the manufacturers furnish an attractive display for trimming sales windows.

Wells Self-Opening Die.

The Greenfield Tap & Die Corporation, of Greenfield, Mass., have just published a non-technical book dealing with the many uses and advantages of their product, the Wells Self-Opening Die, a device made in a number of sizes and styles, both for lathes and automatic screw machines.

Every repairman or machinist interested in this product should write for one of these interesting little books.

Saturday Evening Cash Register.

The Metallurgical Laboratories of Paul G. Niehoff & Co., formerly located at 350 N. Clark street, Chicago, have been removed to 232-242 E. Ohio street, Chicago, the change being rendered necessary by the large increase in business. This company announces the publication of an interesting little booklet entitled

A Bright Little Booklet.

the Saturday Evening Cash Register, a little paper designed to promote the interest of their organization and give valuable little pointers on the manufacture of their products. The articles are "up to the minute" and should be of great interest to every reader.

Little Giant Starter.

A device which should be of great interest to every Ford car driver is sold by the Little Giant Starter Co., of Canton, Ohio, and known as the Little Giant Starter. It consists of a foot pedal and a length of chain which is fastened through suitable adjusting device to the engine crank shaft. Pressure upon the foot pedal turns the engine over, enabling one to start the machine without leaving the driver's seat. When not in use the foot pedal locks against the dash out of the way. The whole installation is very simple and can be performed in a very short time.

Maco Accessories.

The Motor Accessories Corp., of 170 Broadway, New York City, announce that they are putting out an interesting line of accessories and request live dealers to correspond with them.

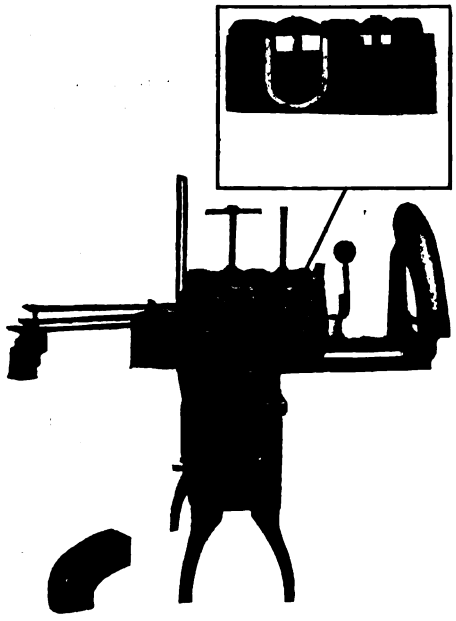
New-Type-F Equipment.

A noteworthy improvement has been made this year in the New-Type-F Equipment of the Akron Rubber Mold & Machine Co., makers of the well-known line of Tip-Top Ti-Re-Pair Outfits.



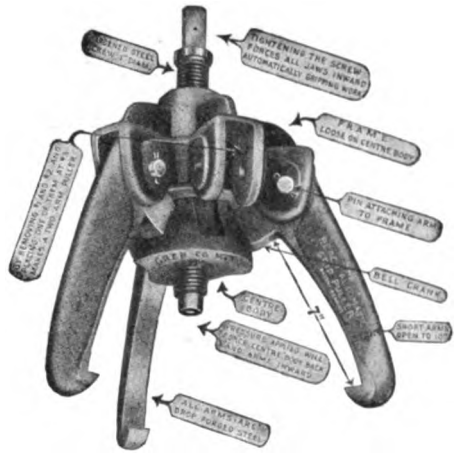
One of the cavities has been increased in size from 2½-3" to 3½-4", and provided with a reducing shell to take the 2½-3" size. The other cavity remains the same as last year—4½-5". It will be seen that this permits two popular size tires to be cured at the same time, doubling the capacity of the equipment on this particular class of work on which every tire repair shop always has a large amount. At the same time the less-called-for smaller work can also be handled so that the outfit shop does not have to turn down any work that comes in.

The New-Type-F Equipment is also fitted with Inside Patch Attachment 3½-4", on which practically all sizes of inside work can be handled. Each outfit is equipped with set of Bead Molds 2½-3", 3½-4", 4½-5", either Straight Side or Quick Detachable made in one-fifth circle only. Outfit also equipped with self-contained source of steam supply, so that the purchase of separate boiler is not necessary.

The New-Type-F Equipment is now offered for $180, and is without question splendid value for the money. Regularly furnished with gas burner; gasoline or coal oil burner furnished at slight additional cost.

The Akron Rubber Mold & Machine Company manufacture a complete line of tire repair equipment covering various requirements of output and service at corresponding prices, and are also large makers of molds and tire builders' equipment.

Full particulars regarding the New-Type-F outfit or equipment for any requirements may be obtained by addressing the Akron Rubber Mold & Machine Company, 917 Sweitzer avenue, Akron, Ohio. This company issues a booklet,



New Type F Vulcanizer Equipment.

"Tire Repairing, The Business of the Times," which should be of interest to anyone investigating the possibilities of the tire repair to-day, a copy of which will be sent on application.

Beach Automatic Grip Puller.

A good wheel or gear puller is as indispensable in a garage as a hammer. It may be used in a great many ways. It is practically the only tool with which a flywheel may be removed without the attendant danger of breaking the crankshaft.

The Beach Automatic Grip Puller,

Beach Automatic Grip Puller.

manufactured by The Greb Co., 197 State street, Boston, Mass., is built mechanically right, and when once the jaws are closed on the work and the screw is set against the shaft, it is impossible for them to unhook. Tightening the screw forces the jaws inward, automatically gripping the work, throwing pressure toward shaft or axle, making it more positive and requiring less pressure than the ordinary puller.

Positively removes wheels, gears, flanges, couplings, universal joints, wrist pins, and any number of other things. Quick, strong, durable, efficient and simple. It is complete with two sets of jaws; three 7½" jaws (open to ten inches), and three 12" jaws (open to eighteen inches).

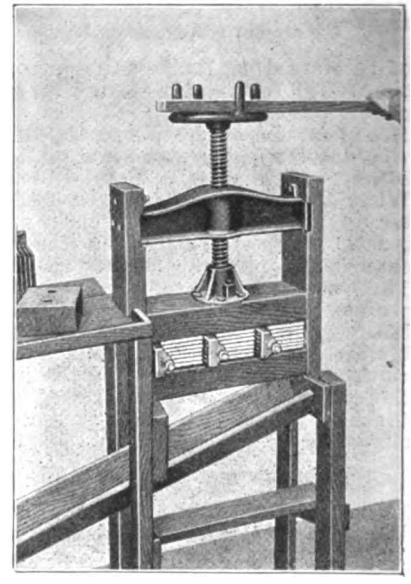
Either a two or three jaw combination may be used, as there is an extra jaw socket directly opposite one of the other jaws. It is also made with a locking device by which the jaws may be set and locked in any position, which makes it a one-man puller.

Panvar Car Refinishing Liquid.

When an automobile is new, the owner takes great pride in the finish, but as time goes on he neglects more and more the care of the varnish, until finally his car begins to look old. All at once he may decide to have it refinished, but finds the cost too great, and is forced to let it remain in its shabby condition. For such owners, The Panvar Co., 608 Bulletin Bldg., Philadelphia, Pa., manufacture a refinishing liquid which is said to bring back all the luster of the original varnish. Panvar, as it is called, may be applied with a brush, but, unlike varnish, it does not harden immediately, but flows evenly, covering all brush marks. It is said that Panvar is weatherproof in all respects, and dries within eight hours.

The Plate Press.

Every battery repair shop must have some means of pressing plates, especially the negative plates. In "pressing" plates, transite boards of the proper thickness are placed in each space between successive plates, with two boards on the outside of the end plates. The group of plates is then put under pressure, either to strengthen the plates or to force the active materials back into the grid, flush with the surfaces of the grids. A large majority of negative plates require such pressing, as the most common fault with negative plates is the bulging out of the active material, thus causing a poor contact with the grids and consequently resulting in a loss of battery capacity.



Never put negative plates into service if the active material is bulged. Such plates will never give good service, and will cause the battery to be sluggish. Always press the active materials of such plates back into place. This will give the battery its approximate normal capacity, and will lengthen its life.

Many garagemen press battery plates in an ordinary bench vise. This is hard on the vise, as acid drops from the plates on the iron parts of the vise, which in time become badly corroded and rusted. Such a vise is weak, breaks easily, and grows very stiff and hard to operate. The vise is therefore not well suited for this work because it is made of metal.

The AMBU Battery Plate Press, as illustrated, is specially designed for pressing battery plates and is so constructed that there is no metallic part which can be reached by acid dropping from the plate. A trough is so arranged that the acid which is squeezed from the plates is carried off into a drain, and there is consequently no rotting of the floor beneath the press by dripping acid, and no wet, acid covered floor to ruin your shoes and clothes.

A further advantage of the AMBU Battery Plate Press is that there are no iron parts near the plates from which bits of iron may fall on the plates. Iron is one of the greatest enemies of storage battery plates, as it ruins them in a short time.

Three groups of plates may be pressed at once in the AMBU Battery Plate Press, thus resulting in a considerable saving of time. The illustration shows

The Plate Press in Use.

clearly the construction of this press, and complete presses may be purchased from the American Bureau of Engineering, Inc., 1018-24 So. Wabash avenue, Chicago, Illinois.

"Have used
set of Cork Insert Transmission Linings on my Ford for

10,000 miles

and they are

good as new"

—so writes Edward P. Schafer of Millvale, Pa., and his is a typical Ford owner experience with Cork Insert Transmission Linings. Outwearing two to three sets of ordinary linings, they end the nuisance and expense of frequent replacements. Throughout their long wear they give wonderfully efficient service. They stop the grab, slip and chatter — replace it with velvety smooth transmission action. They eliminate the heavy vibration and strain on mechanism and the Ford rear end. They make the Ford brake *brake*. They require less pressure on the pedal. They permit the hauling of a heavier load. Service considered, Cork Inserts are by far the most economical linings you can buy. Your dealer has them or can easily get them for you.

Dealers: Cork Insert Transmission Linings and Fan Belts give you a line of *good profits* in place of a small margin staple. Sales have jumped ahead every month the past year. Order Cork Inserts from your jobber and cash in on this winner.

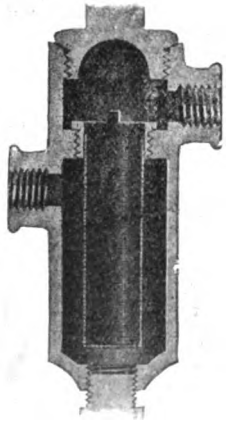
Tire Announcement.

The Jandorf Auto Company, 1769 Broadway, N. Y., announce that they have a large stock of standard make tires on hand which they are selling with big discounts. Bona fide dealers are requested to send for their list of prices and discounts.

Peck's Super-Heat Manifold.

To meet the demand for fuel service and gasoline economy Peck's Super-Heat Co., of 640 Middlebury street, Elkhart, Indiana, manufacture a manifold for Ford cars which consists of a dual manifold casting. Cast integrally with the intake manifold is a large exhaust passage which is designed to transmit the heat from exhausted gas to the ingoing vapor. This system is said to result in perfect gasification of the fuel, thereby reducing carbon and prolonging the life of the engine.

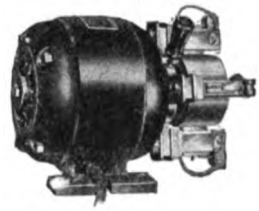
The manufacturers also claim greater flexibility for the engine when the device is used. The installation of this device calls for no changes in the engine beyond the removal of the present manifolds.



Peck's Super-Heat Manifold.

Sasco Strainer.

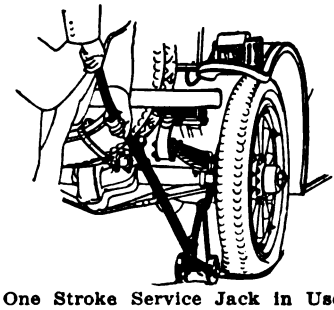
Many carburetor troubles may be traced to foreign substances in the gasoline. Dirt, dust and water, despite all precautions, sometimes find their way into the fuel tank, and to prevent the substances from going through into the carburetor the Sasco Strainer has been designed. This product is manufactured by Sage Bros., Inc., 780 Union street, Brooklyn, N. Y., and consists of an aluminum casting in which is fitted a fine mesh basket. The lower chamber of the body is connected with the fuel line while the upper part is connected to the carburetor.



To pass from one connection to the other, the gasoline filters through the mesh basket, which has a very large surface. The basket can be removed for cleaning and replaced in a very short time. Both chambers are fitted with removable caps for cleaning.

Sasco Strainer.

Breco Converters.



Perhaps no field related to the automobile industry is growing faster than that of the storage battery recharging stations. No matter whether a car is fitted with a generator or not, if it has a storage battery, the battery should be charged frequently from an outside source. The Breco Electric Co., 206 Huron street, Toledo, Ohio, manufacture a big line of alternating current rectifying devices in all sizes and designed for charging from one battery up. Individuals owning cars, as well as the large garage owner, who does a big battery recharging business, should investigate this line and write for catalogue.

One Type of Breco Converter.

Gemco One Stroke Service Jack.

"Quick service" is the motto of to-day and upon that principle the Gemco one stroke service jack has been designed. This device is made by the Gemco Mfg. Co., 742 South Pierce street, Milwaukee, Wis., and is designed in such a way that downward pressure upon the long handle gives sufficient leverage to lift practically any car from the ground. For different heights, a handle adjustment is provided. The whole device is strongly and substantially made and mounted on two wheels. The accompanying illustration gives an idea as to the utility of the device.

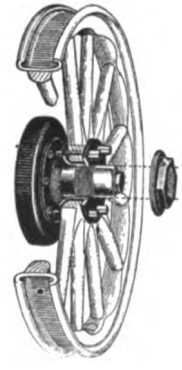
One Stroke Service Jack in Use.

The Hotel Winton.

What is described as the newest and finest hotel in Cleveland was opened December 20, 1917. We refer to the Hotel Winton, which is centrally located at Prospect avenue and Ninth street and has every conceivable modern convenience. No doubt a great many of our readers will be glad, when stopping in Cleveland, to look up the Winton and engage rooms there.

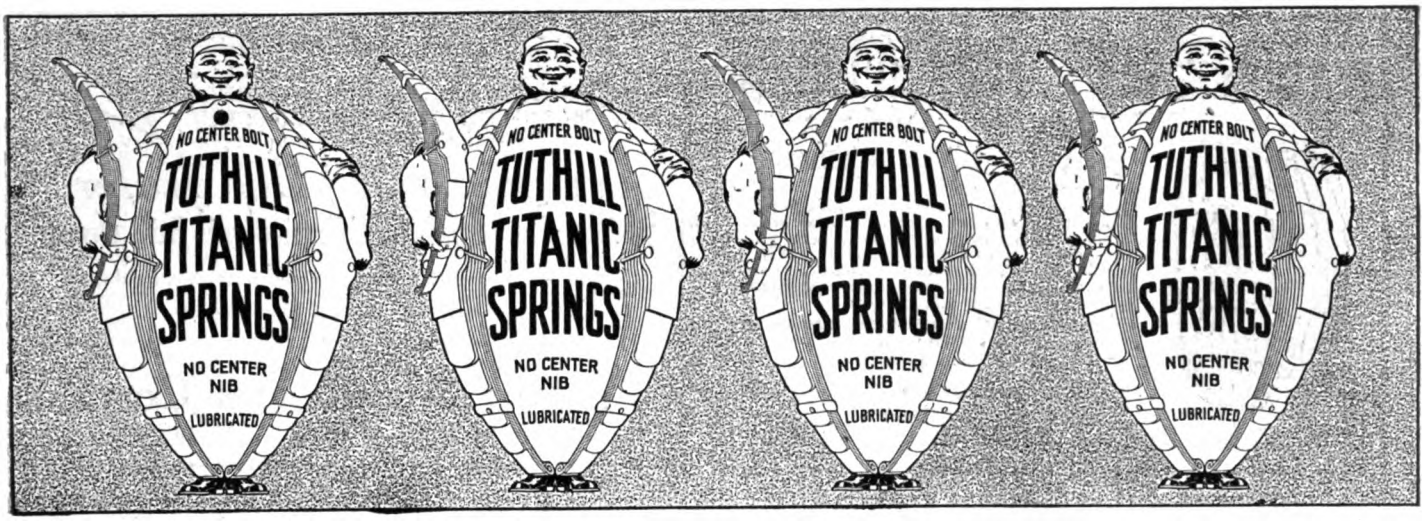
The Aero-Starter.

Mr. W. G. Farnsworth, formerly Secretary and Treasurer of the Dearborn Motor Truck Co., has recently taken a position of Vice-President of the Newstarter Mfg. Co., 1901 S. Western avenue, Chicago, Ill. This company manufacture a new and novel device known as the Aero Starter and Tire Inflator and designed for Ford cars. The complete outfit consists of a starting motor, an air compressor and a storage tank. The starting motor is a powerful four-cylinder, ball-bearing air engine, which is used only at the time of starting and takes compressed air from the storage tank. The compressor is of the automatic type and driven by a chain from the camshaft. It maintains a pressure of 200 pounds in the storage tank and operates only when the pressure drops below that figure. The manufacturers claim that the time required for installation is from two to four hours and that no alterations in the present Ford design are necessary.



Tell-Tale Piston Ring.

Something new in the piston ring field is introduced by the Vulcan Machine & Tool Co., of St. Louis, under the name Tell-Tale. This ring is of the step-cut pattern, individually cast and made of the best quality iron. The patented feature of this ring is the unique arrangement of oil groove or channel with vents on the wearing surface. The manufacturers claim that such is the design that oil is distributed to every section of the cylinder walls. Another important feature is the turned wearing surface which soon wears in conformity with the cylinder shape



The Minute Demountable Wheel.

Changing tires on the road is at best a tiresome job and few motorists care for this sort of work. This is the reason for demountable wheels or rims with which most of the high priced cars are equipped. The Ford car is one of the few not fitted with such a convenience and to meet the popular demand the Hill-Smith Metal Goods Co. of Boston, Mass., manufacture a hub device, with which the Ford car wheel equipment can be made into those of the demountable type. A set of minute wheels consists of four main hubs which fit the Ford axles, together with all the auxiliary parts for five wheels, an extra wheel and the Minute wrench. The regular Ford wheels are retained. The time required for making a tire change is short; one has only to jack up the car, pull out the locking slide on the minute hub, place the wrench on the large nut, holding the wheel and spin the wheel, which may then be removed. The new wheel with fully inflated tire is put in place of the old, and the process reversed.

Application of Minute Demountable Wheel.

STOP REAR AXLE TROUBLES

BY INSTALLING THE

BAILEY BALL THRUST

The bearing that replaces flat thrust washers at gear side of Ford and Chevrolet 490 differential, the common cause of all axle breakdowns. The Bailey keeps drive and pinion gears in proper mesh, makes them run smoothly and last indefinitely. Prevents axle trouble. Has six times the maximum thrust and is guaranteed to "stand up" under all conditions.

See your dealer today and forestall expense and axle repairs for 1918.

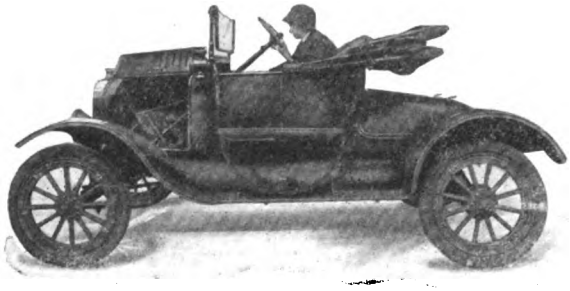
Perry Auto Lock.

Locking the car to prevent it from being stolen is a big problem to-day, for motor thieves are daily improving in their methods.

The Perry Auto Lock, manufactured by the Perry Auto Lock Co., Department A, 2210-14 Michigan avenue, Chicago, is an ingenious arrangement which can be attached to the steering wheel of practically any automobile.

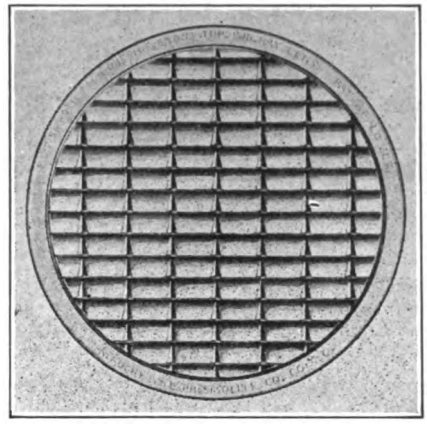


With the device in use, the machine may be locked so that the steering wheel is entirely disengaged from the rest of the mechanism and rotates independently. A turn of the key allows the wheel to drop back into place so that the car may be guided by the operator.

Du Pont Announcement.

Perhaps the largest publicity and advertising campaign ever carried on will be started by the Du Pont Sales Promotion Division, Dupont, Wilmington, Del. The purpose of this is to find jobbers and dealers throughout the country prepared to handle the Du Pont line. Anyone interested in this should correspond with the sales division.

Pres-Toe Starter.



The new Pres-Toe starting device, made by the W. Robertson Machine & Foundry Co., of Buffalo, N. Y., is said to be greatly improved in design, over the one put out last year. The latest model is made with a compound leverage which is said to increase the power application more than 100 per cent. over an equal amount applied at the hand crank. The device is operated from the seat, and the manufacturers claim there is absolutely no chance of a "back-kick" injuring the operator. In connection with the starting device is a butterfly valve, which is operated automatically and makes engine starting easy. With the Pres-Toe installed, the hand crank is still available for emergencies.

Illustrating the Pres-Toe Starter.

Sun Ray Lens.

The headlight problem and proper light diffusion is admittedly one of the biggest confronting the drivers of to-day. Engineers spent much time upon headlight lenses, and as a solution the Prismolite Company, of Columbus, Ohio, offer their product under the name of Sun Ray Lens. This device consists of a number of horizontal prisms designed to deflect the light from the headlight bulb parallel with the road surface at a distance to conform with various State laws and downward so as to give maximum illumination upon the road bed. A unique arrangement of triangular vertical prisms diffuse the light to the sides of the road, lighting the curbs and ditches and enabling the driver to pass other machines without blinding the average driver with a brilliant glare.

The Sun-Ray Lens.

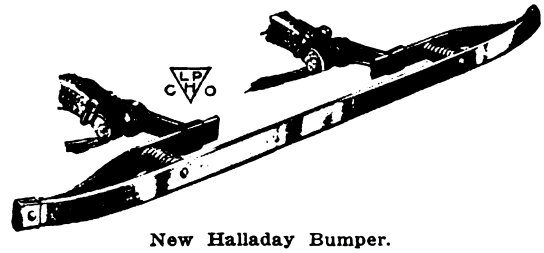
Guaranteed Magneto Parts.

The Guaranteed Magneto Parts Co., of 1765 Broadway, N. Y., market a complete line of replacement parts for magnetos, coils, starters and generators of standard makes.

Automobile Painting System.

Now that spring is here, the motorist begins to think of "sprucing up" his car and giving it a coat of paint for the coming season. The F. O. Pierce Company of 12 West Broadway, New York City, market a painting outfit with which it is said the car owner can paint and varnish his machine in three days. Any one interested in this system should write the manufacturers for their descriptive booklet, which contains a sample list of colors.

New Halladay Bumpers.



L. P. Halladay Company, Streator, Ill., offers a number of new bumper designs for the 1918 trade. The two that are attracting the most attention are the Multiple Spring Bar, and the Standardized Unit.

The Multiple Spring Bar is, as its name implies, a combination of the usual type of spring bar and two auxiliary buffer springs. The front member is a continuous spring bar made in two sizes, 2x⅜" and 1¾x5/16". Joined to this bar at ends by flexible connections are two inwardly extending spring members as the front bars. These form the supporting members and are secured to the various patterns of the Halladay support.

The Buffer springs are located between the outer and inner bars, with the result that on meeting an obstruction, no matter at what point of the bar the impact is received, the shock is distributed throughout the entire length of the bar, each part of the bar construction absorbing a part, and the least possible portion of the shock is transmitted to the car frame.

By making the rear or supporting members separate pieces and secured to the main bar by flexible connections, breakage at that point is eliminated.

Should, in the event of extremely violent accidents, any of the several pieces of the bar construction be broken, that particular piece can be quickly replaced at comparatively small cost.

New Halladay Bumper.

A Court Decision.

The United States District Court, Northern District of Ohio, Eastern Division, has sustained the validity of patent 1,215,904 on Brown spring oilers and has held the Diamond Spring Oiler Co. an infringer. The Brown spring oiler, as most of our readers know, is manufactured by the Brown Spring Oiler Co., of Cleveland, O.

Made from Oil-Tempered Spring Steel Wire

They Remove Carbon Where Others Will Not
PATENTED MARCH 28, 1916

Cut out experimenting—get down to business. Why not own a set of FLEXIBLE CARBON SCRAPERS? They are the only scraper on the market that will do a satisfactory job without taking the motor to pieces. Compounds are dangerous. All good mechanics advise scraping carbon. Over 100,000 sets now in use by Auto Mechanics.
Ask Your Dealer or Write
Flexible Carbon Scraper Co. 1421 W. Washington St. Los Angeles, California

The Magnet

Digitized by Google

That Draws Trade

Big business follows this visible pump. The owner *sees* the gas measured in a glass reservoir. He will travel far to buy gas from the visible pump. So would you. So will any man. Nothing else so quickly builds trade and profits. Realize how this pump can increase your own sales. A modern, logical, human answer to economy which everyone seeks. The longer you delay installing the *visible* pump, the more you delay development of your business. This device is actually a magnet which brings customers to your door.

Does away with hand-pumping
Automatic and self-measuring
Positive filter—easily cleaned
Impervious to weather conditions
Handles any grade of gas
No adjustments
Handles one or more grades
No gasoline above ground

All good features without any imperfections, makes this the logical pump.

Let us send you complete proposition and illustrated booklet. Dealers everywhere are enthusiastic over this remarkable pump. Write today!

BROTHER—Accidentally discovered pleasant root, chewed like gum, quickly, easily, overcomes both tobacco habit and indigestion. Gladly send particulars. G. A. Stokes, Mohawk, Florida.

A Large Order.

A very large order in the accessory line was taken at the Boston Automobile Show by Mr. J. J. Kelleher, Sales Manager of the Stenman Electric Valve Grinder Co., of Worcester, Mass This was an order taken from the Linscott Auto Supply Co. of Boston for the well-known Stenman valve grinder. The amount represented was $17,500 and called for immediate delivery of the goods. The Linscott Auto Supply Co. reported that they had sold over their counter at the show more than 125 Stenman grinders. Perhaps the above facts are a sufficient attestation of the practical value of the Stenman electric valve grinder.

Firestone Seconds.

For those who desire a high quality cord tire but do not feel like purchasing a new product, Frank W. McAllister, 1761 Broadway, New York City, are offering Firestone Super Cord Tires at very interesting prices.

These tires are said to be only slightly blemished and are claimed to give their full original mileage. Other high-grade makes of seconds are also carried in stock.

Macbeth Lens.

The alarming increase in the number of automobile accidents caused by glaring headlights had definitely established the need for a device which will prevent direct glare, but at the same time furnish light enough for illumination. After four years of experimenting, the engineers of the Macbeth-Evans Glass Co., of Pittsburgh, Pa., produced a headlight lens which is claimed to be efficient as well as pleasing. This lens consists of five horizontal prisms, each of which is inclined at an angle determined with scientific accuracy. These prisms direct the light rays below the horizontal upon the road a distance ahead of the car. At the back of the lens a concave recess is provided which results in the deflection of light beams to the side of the car. A visor-like, green shade, extending from the top of the lens, prevents any stray beams from blinding an approaching driver.

New Spery Radiator.

In the Spery radiator, manufactured by the Hooven Radiator Company of Chicago, the makers contend that a great addition in radiator construction has been achieved.

A front view of this radiator would give one the impression that it was of the honeycomb type. The cross-section, however, shows it to be a combination of the honeycomb and tubular principles. The sections are made of zigzag stampings carefully fitted together and stoutly braced from top to bottom. Running vertically are a series of cores pressed into the zigzag sections. These cores not only act as water channels and prevent the clogging of the small sections, but also serve to strengthen the sections.

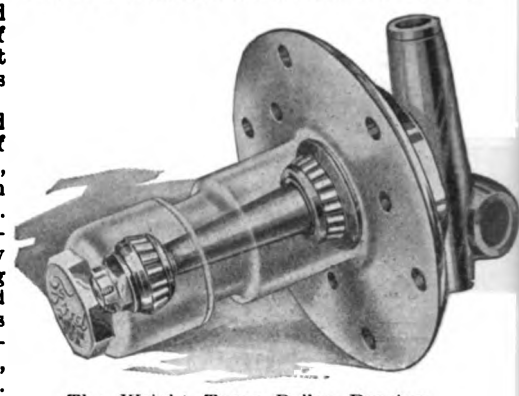
Johnson's Radiator Cement.

Frequently a radiator springs a leak at some point within, and to repair the break in the tube or section by the soldering method would mean considerable time. A method that is gaining favor among owners is the application of cement in the radiator liquid. A radiator

Radiator Repair Cement.

cement of this kind is manufactured by S. C. Johnson & Son, Racine, Wis., and is simply dissolved in the cooling water, the engine run for a few minutes until the leak is stopped, and the cement allowed to harden. The manufacturers claim a permanent repair can be made in this manner.

Carleton Generator.



For those Ford drivers who are not satisfied with the Ford magneto as a source of lighting current, the Carleton Mfg. Co., 170 Summer street, Boston, Mass., manufacture a lighting outfit which has many interesting points.

The generator is designed to be applied to the left side of the Ford engine and is operated either by a special belt which also operates the Ford fan, or if desired by a special silent chain and sprocket arrangement. With the generator is furnished an automatic governor and cut-out which controls the current passing to the battery.

The system provides an independent lighting system which is comparable with lighting systems installed on high-grade machines. In addition to the Ford system, equipments are made by this company for Saxon and Metz cars and for motorcycles or motor boats.

Wright Taper Roller Bearings.

Many Ford owners do not care for the standard ball bearings furnished for the front wheel spindles, and to satisfy a demand, the National Bearings Service Co., of Philadelphia, Pa., manufacture a

The Wright Taper Roller Bearing.

special type of taper roller bearings which may be used to replace the present Ford bearings. The accompanying illustration clearly shows the construction and application of this device.

Tops and Body Equipment.

George W. Copp Co., Inc., of 351-355 West 52d street, New York City, and formerly known as the New York Auto Equipment Co., Inc., announce that they are prepared to supply automobile tops of all standard styles as well as upholstery, tire covers and seat fabrics. This firm also make a specialty of custom body work as well as painting, and are well known throughout the country for their excellent work.

Workrite Combination Outfit.

Absolute cleanliness is one of the essentials which makes for long storage battery life. Only by keeping the filler bulb and hydrometer away from the dust and dirt can cleanliness be preserved. The Workrite combination outfit, made by The Workrite Mfg. Co., of Cleveland, Ohio, is a combination hydrometer, battery filler, and water bottle. The battery filler, which contains the hydrometer, is fitted with a rubber filler tube and a large bulb, both the tube and the bulb being provided with large washers or flanges to prevent breakage, should the device be dropped upon the floor. The filler fits into the distilled water bottle, upon which is pasted full directions for storage battery upkeep. The filler and hydrometer may be purchased separately if desired.

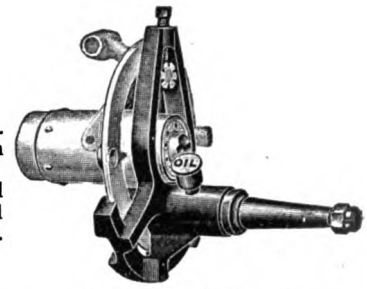
EMERGENCY AXLE STUBS FOR FORD CARS AND OTHER CARS

Emergency Axle No. 1

Emergency Axle No. 2



These devices are for bringing in cars with broken axles. With either type of axle, a car can be placed on its own wheels within a few minutes time.

The No. 1 and No. 2 axles require an extra front Ford wheel and cones, while the No. 3 uses the rear wheel and has a compression grease cup to prevent it from getting hot.

Nos. 1 and 3 are for Ford cars.

No. 2 is for all other makes of cars.

List Prices: No. 1, $5.00; No. 2, $10.00; No. 3, $6.00

Emergency Axle No. 3

Portable Work Bench

PORTABLE WORK BENCH & ENGINE STAND

It is provided with two large trays, 22x24, for convenience, where the workman can place his tools, motor, and axle parts. The stand is mounted on three 4-inch diameter wheels. The rear castor wheel is so constructed that by pulling the plunger jim, the castor will swing up off of the floor and the stand will then rest firmly on its legs. By kicking the castor lever down, the stand will go back on its wheels and lock automatically.

A Ford assembly can be fastened to the stand the same as with our Motor Stand.

The Work Bench is also equipped with a machinist's vise, which has a 3-inch jaw with a 4-inch opening, which will handle any work required in overhauling a Ford motor or axle, also other kinds of work.

The Work Bench & Engine Stand is 36 inches high, 27x42 inches floor space.

Weight, 120 lbs. **List Price, $40.00**

MOTOR STAND

The handiest device of its kind for use in shops and garages doing Ford engine work. The Ford motor when taken from a car can be fastened to the stand by the two cap screws which screw into the side of the motor where water inlet connection is fastened. The stand is so constructed that the part screwed to the motor will revolve in the clamp on the stand and can be locked by tightening the lock-screw which will hold the motor in any position or angle desired to suit workman. It also has a tool tray where the workman can place his wrenches or parts of the motor, if so desired. It is mounted on wheels so it can be moved from place to place. It is 34 inches high; 32x30 inches floor space.

Weight, 50 pounds.

List Price, $20.00

Motor Stand

AXLE ATTACHMENT

Axle Attachment

The attachment is for use on either our Portable Work Bench & Engine Stand or our Motor Stand.

By merely bolting this Attachment to the revolving part of the stands, it quickly converts them into axle repairing stands for repairing nearly all makes of automobile axles.

Weight, 9 pounds. **List Price, $6.00**

Axle Attachment

PORTABLE GARAGE GREASE GUNS

Model B Grease Gun

Consists of a heavy seamless steel cylinder mounted on wheels, has five feet of hose attached to bottom with shut-off valve and nozzle at end of hose. Register measures accurately the amount of grease put into axle housing or transmission case and will work equally as well on liquid oil as on hard grease.

The cylinder is 20 inches long by 6 inches in diameter; capacity, 20 lbs. of grease or 2½ gallons of oil. The piston is covered with best quality cup shaped leather and is provided with an expansion ring in piston which eliminates grease and oil from leaking by the piston. The piston also has an automatic air vent to release the vacuum in the cylinder when cranking the piston up for refilling. The base is provided with a locking device which lifts the castors up from the floor when cranking.

TO OPERATE: Turn crank until piston comes out of cylinder, the head and piston can then be turned to one side and the cylinder filled with grease; set register by pressing indicator rod down to zero and turn crank until you get the amount of grease desired; register will show the exact amount of grease put into the gear case, the register can be reset any time desired by pressing indicator rod down to zero. The same indicator is used for grease and liquid oil. When grease is used it indicates pounds, and for liquid oil it indicates pints.

Models B and K provided with a set of quick return gears and can be refilled in one minute. Weigh-, 95 lbs.

List Price, each, $47.50

Model A is not equipped with return gears. Can be refilled in one minute. Weight, 90 lbs.

List Price, $45.00

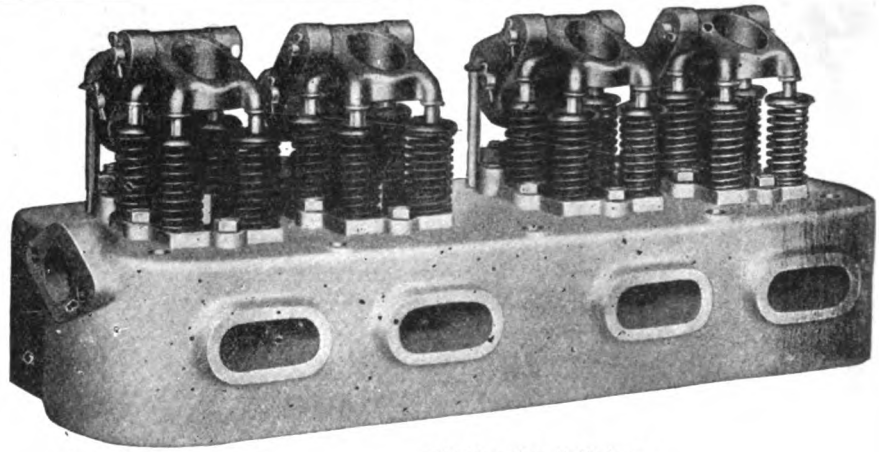
The chances are 4 to 1 that the bearings in your Ford front axle won't last 12 months. Why not anticipate the troubles bound to come through poor alignment and install Wright Taper Roller Bearings to prevent these troubles?

These unique roller bearings are identical in design with those used on the highest grade passenger and commercial vehicles. They'll outlast your Ford and will absolutely prevent misalignment of the front wheels and excessive tire wear. The use of demountable rims crushes the present Ford bearing. Wright Taper Roller bearings will carry this additional load.
There's no difficulty in installing them as they fit the Ford without any changes whatever.

Price, $10.00 per set
(4 Bearings)
In Canada, $15.00



Wright Taper Roller Bearings Installed on Ford Front Spindle.

WEAVER Auto Hoist

Raises Front or Rear of any Car—Open or Closed Body

Any car,—in any location in your garage,—
can be *quickly* and *safely* elevated.

THE Weaver Auto Hoist can be run astride of the desired car no matter where that car may be located in your garage. Isn't necessary to move three or four other cars in order that the one may be gotten out and into position under a block and tackle or some similar lifting device which can be used only in certain locations.

You only need fourteen inches space on either side of the car to permit this Hoist to be rolled into position over it.

SAFETY

The lifting mechanism is operated by WORM DRIVE;—no treacherous ratchets to slip or break.

The chains are heavy and are each tested INDIVIDUALLY far in excess of their required strength.

The bases are made very broad in order to prevent the Hoist turning over under any circumstances.

TELESCOPING FRAME

The height of the frame may be increased one foot by means of its own lifting mechanism. This is often a great convenience in raising the rear of a closed car.

SINGLE OR DOUBLE CHAIN

When so desired, the burden can be handled by a single suspension as shown in the small cut in the lower right hand corner. This is done by simply dropping the chain over the center roller.

CONSTRUCTION

Frame of heavy five inch channel steel; large ball and roller bearing casters; lifting leverage, 500 to 1; capacity, 3,000 lbs.; height, 8 to 9 ft.

WEAVER MANUFACTURING CO.,

THE WEAVER TIRE SPREADER will spread any casing for inspection and hold it open for buffing.

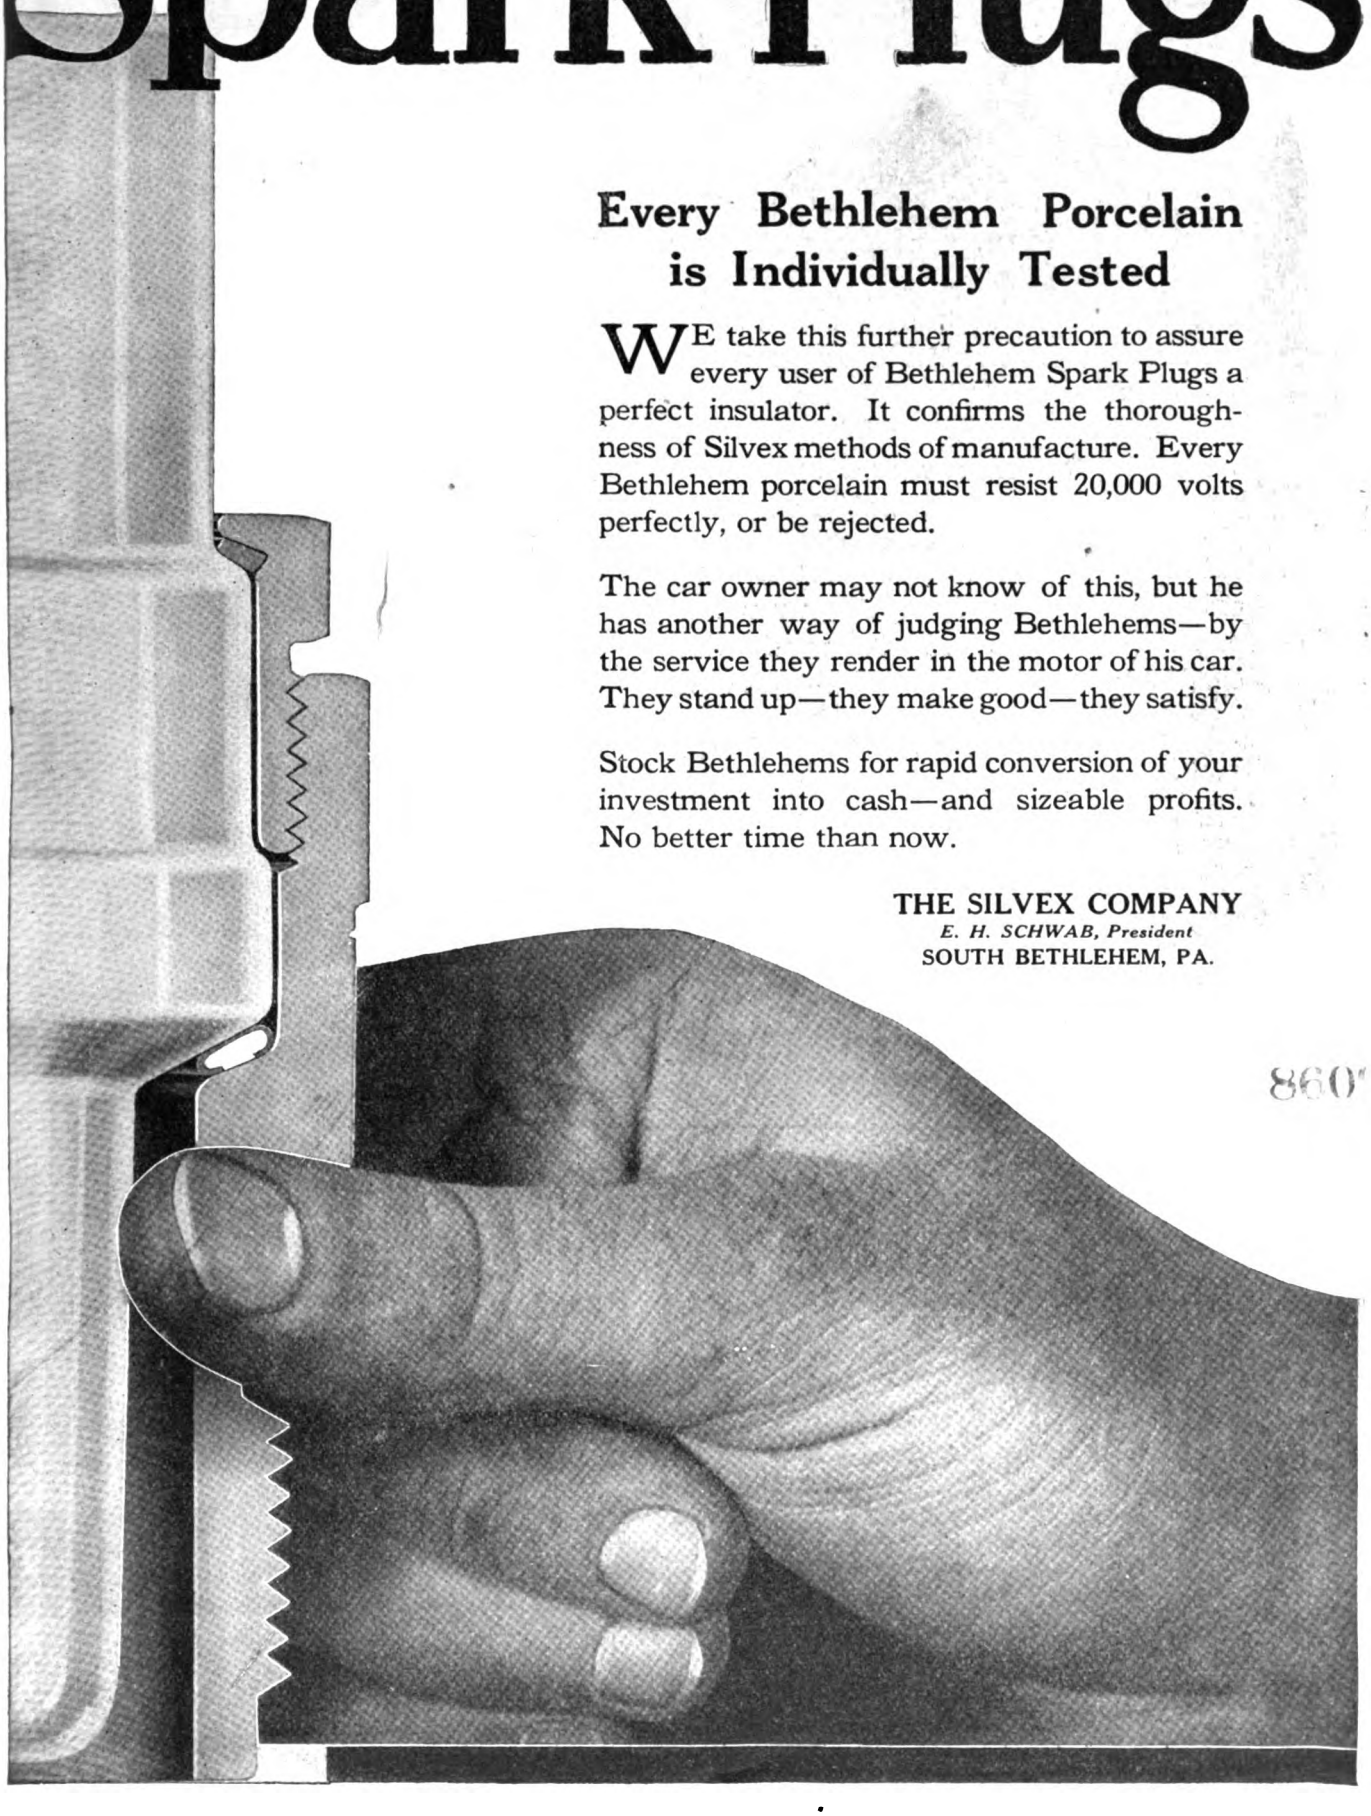
Bethlehem

Sound to the Core

BY far the most vital part of a spark plug is the insulator or core. When this gives way the plug is useless. In stringent government tests, Bethlehem porcelains have given undisputed proof of their greater insulating or dielectric properties. They have been proven three times stronger than the best of the other porcelains examined. In other tests for mechanical strength, they have been proven to offer nine times the resistance of other porcelains to physical fracture.



The Silvex Company does not claim to have replaced porcelain with a so-called new material. What it does claim is simply this: That it has brought the development of porcelain up to the very highest standard.

Please mention the Automobile Dealer and Repairer when writing to advertisers.

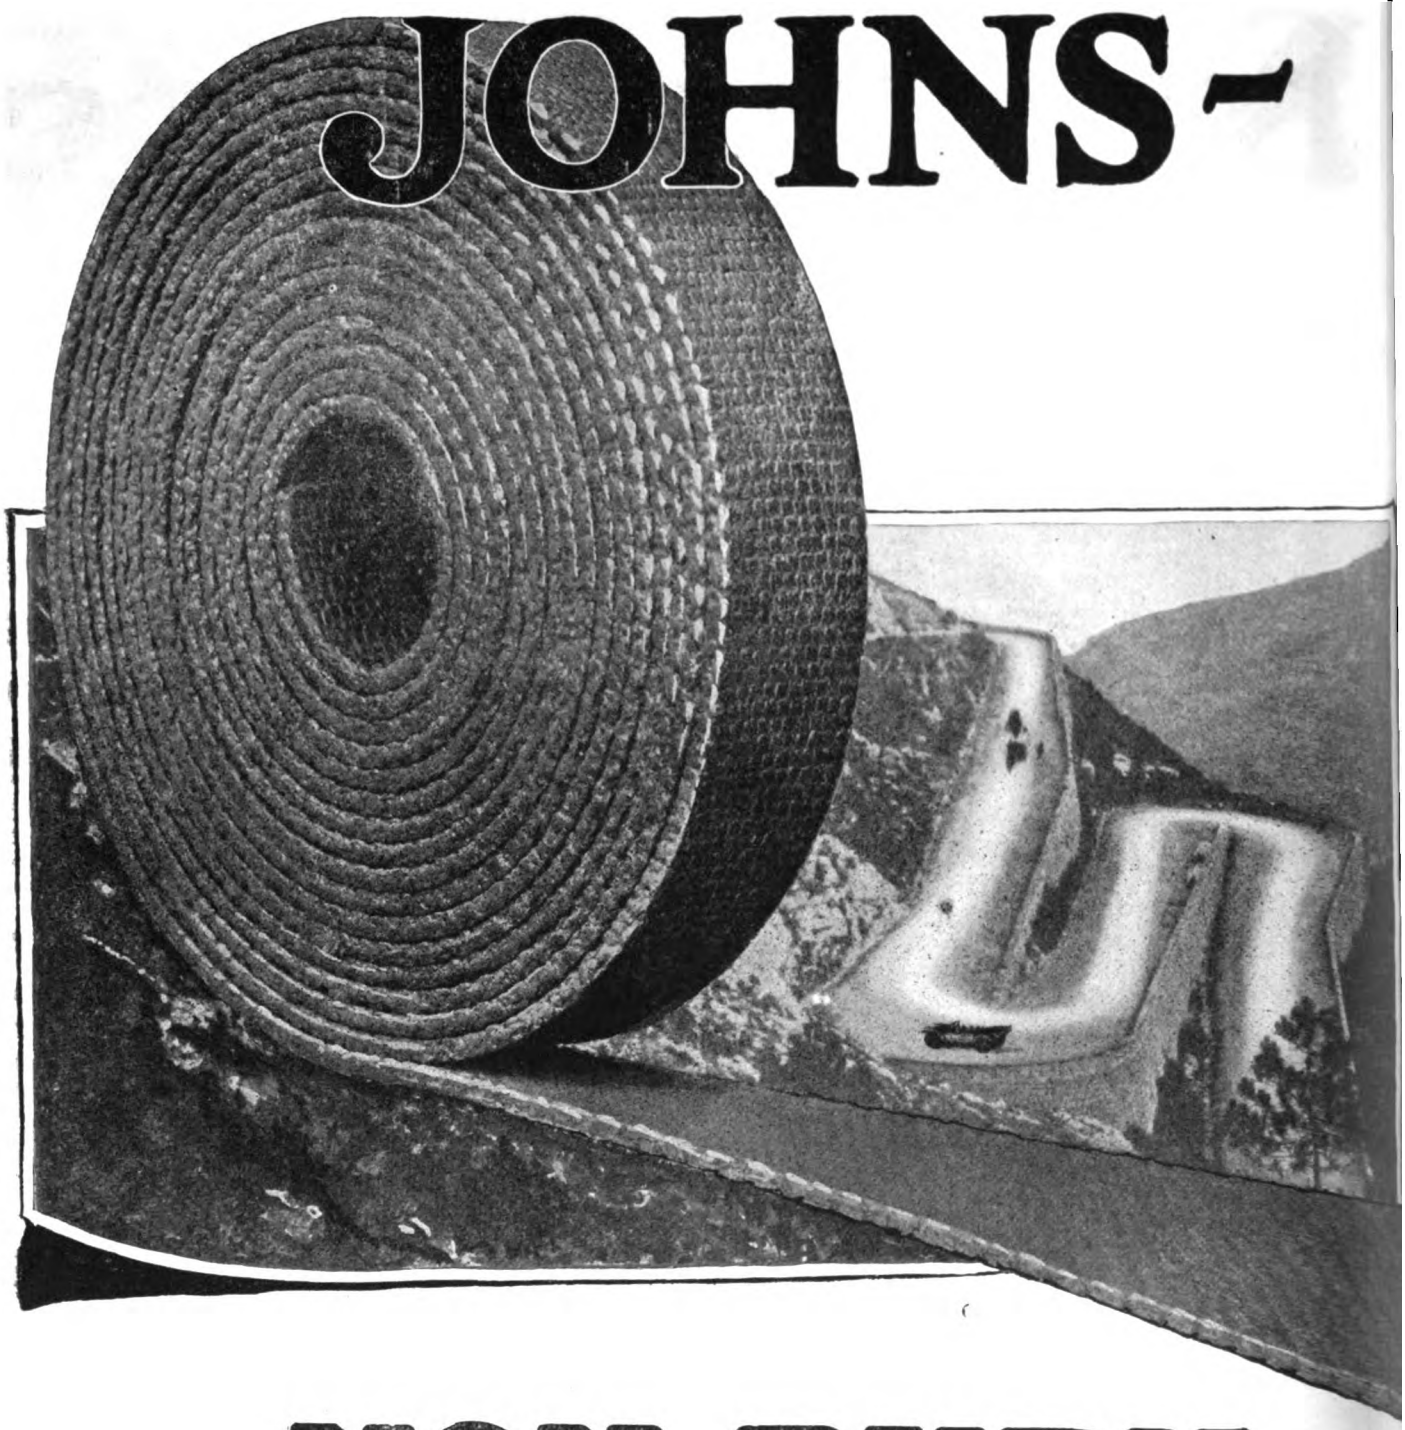
Digitized by Google

Spark Plugs

Every Bethlehem Porcelain is Individually Tested

WE take this further precaution to assure every user of Bethlehem Spark Plugs a perfect insulator. It confirms the thoroughness of Silvex methods of manufacture. Every Bethlehem porcelain must resist 20,000 volts perfectly, or be rejected.

The car owner may not know of this, but he has another way of judging Bethlehems—by the service they render in the motor of his car. They stand up—they make good—they satisfy.



Stock Bethlehems for rapid conversion of your investment into cash—and sizeable profits. No better time than now.

JOHNS-

NON-BURN
ASBESTOS
BRAKE LINING

Please mention the Automobile Dealer and Repairer when writir ; to advertisers.

Digitized by Google

MANVILLE

Brake lining like this is a repair man's good-will builder.

People bring their cars into your shop the first time because they are in trouble. And they come back or they don't, depending on the impression they get of you and your service. As a rule your customers are not mechanics—they can't inspect and recognize a good mechanical job—but they expect a job to last. And it is just like that when you reline brakes.

Perhaps you can put over *any* lining, but you don't want to because it is not good business. Non-Burn on a customer's bill flashes quality to him and he thinks a lot more of you as a service man because he knows about Johns-Manville and asbestos. He has read the asbestos pedigree of Non-Burn in hundreds of advertising stories and you capitalize on all this good-will when you sell this lining.

Now go a step farther—not only install Non-Burn but sell it by talking it—because there is a good profit in it. Perhaps it is natural that NON-BURN quality should be reflected in the policy under which it is sold—the fairest and most liberal sales plan we could devise. NON-BURN is distributed strictly through regular jobber-dealer channels. Discounts are generous, rigidly maintained and uniform, regardless of quantity—permitting rapid turn-overs and protecting your profits. Details on application

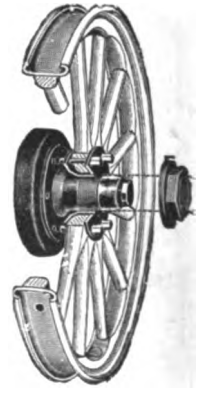
H-S

"MINUTE" DEMOUNTABLE WHEEL FOR FORD CARS

Licensed under patents of Wire Wheel Corp. of America.

"One Nut To Unscrew That's All You Do"

THE QUICKEST TIRE CHANGE IN THE WORLD



Who says it can't be done?—let some grouchy doubting Thomas who is sure "it can't be done" remove the large nut with the powerful Minute Wrench and make the change himself in a minute. This simple stunt never fails to convince.

Install a set on your own Ford and watch the interest created by the Minute Hubs.

Minute Wheels Are Easy To Install They Are Also Easy To Sell

H-S Minute Wheels are as great an improvement over demountable rims as demountables were an advance over the clincher rims of former days.

With this time-saving device, Ford owners can change tires in sixty seconds. Therefore, why waste fifteen to twenty minutes on a tire change?

Your Ford customers will welcome a chance to escape the drudgery and inconvenience of tire changing, especially during the rainy season of March and April.

It will pay you a substantial dividend to take advantage of our special direct-by-mail advertising proposition which we offer to dealers placing an initial order for four sets of Minute Wheels. We send a series of illustrated letters to your customers on your letter head at our expense. Send for complete story.

We can help you build up a profitable business on Minute Wheels if you are ready and willing to do your part.

First, send for literature—it is important.

The Blacksmiths

NEED YOUR PRODUCT

DO YOU WANT THEIR TRADE?

Some automobile and motor accessory advertisers have been skeptical as to the importance of the blacksmith's trade.

We KNOW and can PROVE that a great majority, probably 90 per cent of the subscribers to the BLACKSMITH AND WHEELWRIGHT have taken up automobile repair work and the sale of automobile accessories and supplies.

We also know that our readers do not see the regular automobile publications at all. They are located in country towns and you cannot conveniently reach them by means of salesmen. These blacksmith shops are not large, but in the aggregate their trade is a very important one.

The way to get this trade is to use display space in the BLACKSMITH AND WHEELWRIGHT.

For proof that our readers are in the market for your line of goods, we call your attention to the group of facsimile reproductions of letter heads which have come in from our subscribers. These are only a few out of thousands received and they offer conclusive proof that the blacksmith is, AT YOUR DOOR, waiting to buy your product.

Will you let us quote you rates and give you full particulars? If we can only get your trial order for a display advertisement, our medium will talk to you more eloquently than any arguments we can possibly advance.

Please let us hear from you before you forget it.

Spring is the time to get results from our magazine. Don't Delay!

See That Groove Controlling the Oil?

900 Pages instead of 824 **1918—SIXTH EDITION** 3362 Illustrations instead of 2000

STILL $3.32 prepaid **Dyke's Auto Encyclopedia.** STILL $3.32 prepaid

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 **Instructions**—Simplified and practical.

3362 **Illustrations**—the kind you understand at a glance.

2 **Supplements**, parts printed in colors, treating on the construction operation, repairing and adjusting of the **FORD and PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc.

775 illustrations and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene Welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on **Tires** and **Tire Repairing.**

44 pages and 119 illustrations on **Carburetion.**

89 pages and 291 illustrations on **Engine** and **Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index** begins on **colored** paper, easy to refer to.

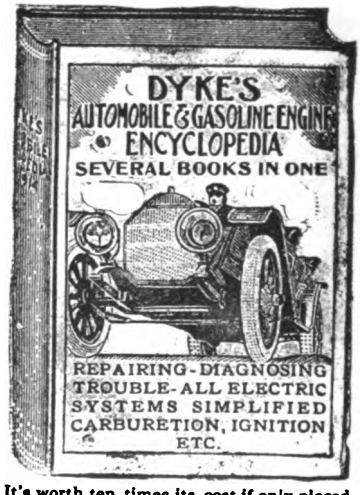
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

You must see this SIXTH Edition in order to appreciate just how complete a book it really is—Order N-O-W.

Price—Although a much larger and better book the price for the present remains **$3.00** (or **$3.28** prepaid, express).

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

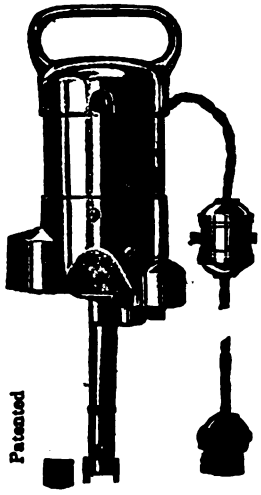
You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?



Mr. Dyke published the first practical Automobile Book in America.

Stenman Electric Valve Grinder

The machine that will save at least $1 labor cost on every set of car, truck, tractor, aeroplane, marine or stationary internal combustion engine valves reground. ***This is one of the sale guarantees.***

The Stenman Electric Valve Grinder is designed for either direct or alternating current and can be operated from any standard lighting circuit.

Any type valve can be reground, either L, T or I-head construction.

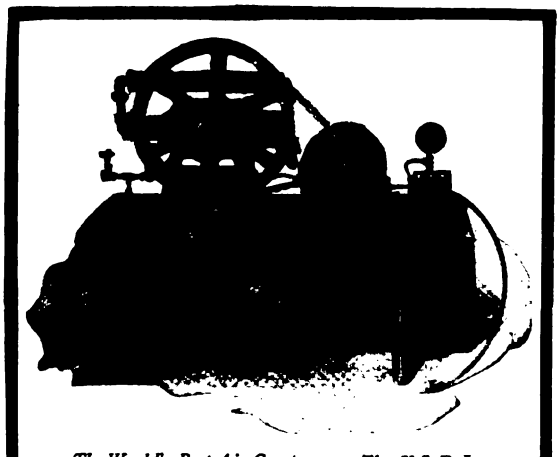
It will renew a valve seat perfectly, doing the work in from three to five minutes as compared with from 15 to 20 or longer with hand tools.

Repair Shop Profit is On Labor

The Stenman machine will earn its cost on the first 25 sets of valves ground. After that all work is clear profit. Its earnings will be in ratio to the work done. Doing the finest and most accurate work it means satisfied and constant patronage for any repair shop or service station. It is practical for any shop. **It will pay 1000 per cent. on the investment, regardless of the size of the establishment.**

Splendidly built, a Stenman machine will afford service for years. It is sold with the guarantee that if defect in workmanship or material develops within six months the defective part will be replaced at the factory without charge.

Used By Those Who Demand Economy and Highest Grade Work



Stenman Electric Valve Grinding Machines are used by the United States Steel Corp., the Western Electric Co., by the Government at Camp Devens and at its aviation field stations, and in many garages throughout New England.

DEALERS AND JOBBERS: There are almost unlimited sales possibilities for Stenman machines. We make a very liberal sales contract and insure you exclusive selling rights. Write today for details of the proposition and state territory wanted.

Our Patents Are Basic. Prosecution will follow any infringement.

The World's Best Air Compressor—The U.S. DeLuxe Two Stage Automatic Air Unit. Contains 14 noteworthy refinements and improvements. The Ideal unit for free air stations, garages and tire shops. Capacity, 4 Cu. Ft. per Minute. Completely self contained.

Found in a majority of the best garages. Standard equipment with companies of national prominence.

Facts About The U. S. Two Stage Air Compressor

THE U. S. Two Stage Air Compressor represents the highest attainments from any standpoint one might judge it.

The efficiency is greatly increased, less power is required and the design furthermore answers the longest possible life with freedom from repair expense.

The noise of running has been so nearly eliminated that it can be truly said to be practically noiseless.

The definite tangible reasons for efficiency of the U. S. Two Stage Compressor are described in detail in our new catalog, just off the press. Every one interested in air compressors should be conversant with these facts.

THE U. S. SINGLE STAGE LINE

The best is always the cheapest in the long run, but nevertheless there exists a demand for comparatively low priced outfits.

To meet this demand we have developed a line of single stage air compressors including complete automatic, semi-automatic, and portable outfits of varying capacity which are recommended as the most efficient of this type in existence.

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	**Pennsylvania**	**Virginia**
New York	**Maryland**	**West Virginia**
New Jersey	**Delaware**	**District of Columbia**

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

Da-cote means an enamel which dries in one day. "Paint it this afternoon—run it out new tomorrow" is the Da-cote slogan.

This broad band is the exact color of the contents of the can. An aid to customer and salesman. A most attractive package. "The label shows the color."

Motor Car Enamel is your big opportunity for Spring. Three million cars need painting and most owners will paint their own cars in this war year.

Our New Product is ready

For months, our chemists and varnish experts have been perfecting Da-cote. Back of those months of special effort, is fifty-two years' experience in making the finest of materials for finishing coaches and automobiles.

Da-cote is designed for the amateur or professional painter. It flows on smoothly, leaving no brush marks, and dries over night. It produces a fine, hard, glossy, elastic finish which will withstand exposure, dust and washing. Da-cote is furnished in black, white and all standard colors.

Da-cote is being heavily advertised in the Saturday Evening Post, Literary Digest, and other magazines—two full pages and two half pages appeared in the Post in March and April. There is bound to be a big demand for it.

Prices, discounts, and terms competitive with other lines of motor enamels.

Write or wire collect for our 16-gallon standard assortment together with window display and Dealers' helps. The season is on—every day lost may mean lost sales.

There's a Harvey Jobber Near You

THE superiority of Harvey Springs has been so well proven by actual experience that there is no longer any question in the minds of garagemen and car owners as to their pre-eminence in strength, resiliency, endurance and all 'round dependability.

Service — Founded on Quality

Having built a Spring of such well established merit, a Spring that has won the respect and support of the entire motor world, it was for Harvey thoroughness to back up this Spring with a service as good as the Spring itself.

Over 900 Styles Always in Stock

In every state in the Union, there is a Harvey Jobber with a large stock of Harvey Springs always on hand. It is his business to see to it that your order is filled and shipped by the fastest route whenever you call on him for help.

THERE'S A HARVEY JOBBER NEAR YOU—Drop us a card and we will send you his name and our Spring Book giving measurements, weights, and sizes of over 900 different styles of Springs and other valuable information that you should have. Write today—you may need Harvey Help tomorrow.

SHALER

5 Minute Vulcanizer

Mends Tubes in 5 Minutes

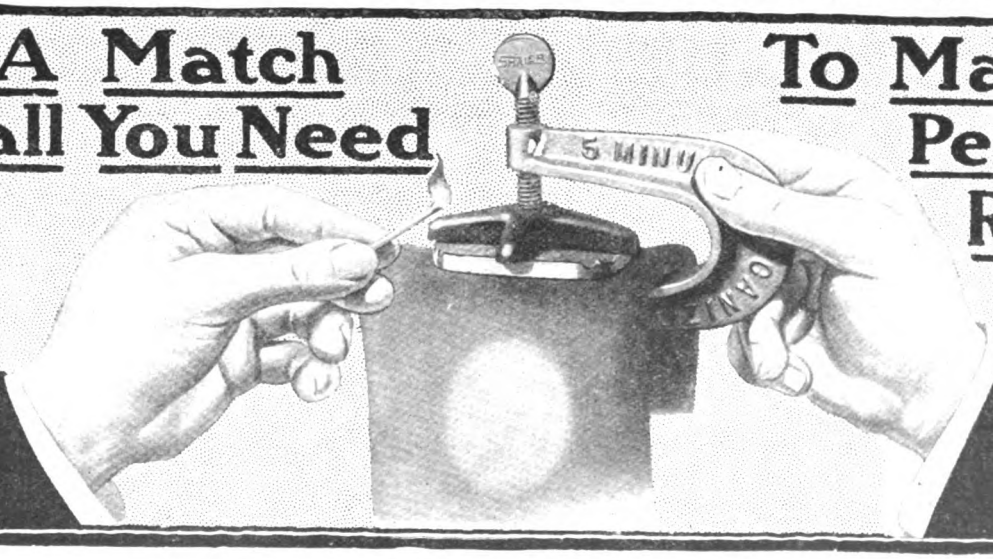
A Perfect Repair in 5 Minutes

Simply place the Patch & Heat Unit over the puncture—clamp the vulcanizer in position—and apply a match to the combustible disc. In 5 minutes you have a lasting, "feather-edge" repair—properly vulcanized with just the right amount of heat.

Over 500,000 motorists are now using this SHALER Vulcanizer. It should be in every car owner's tool box—ready for instant use—on the road or in the garage.

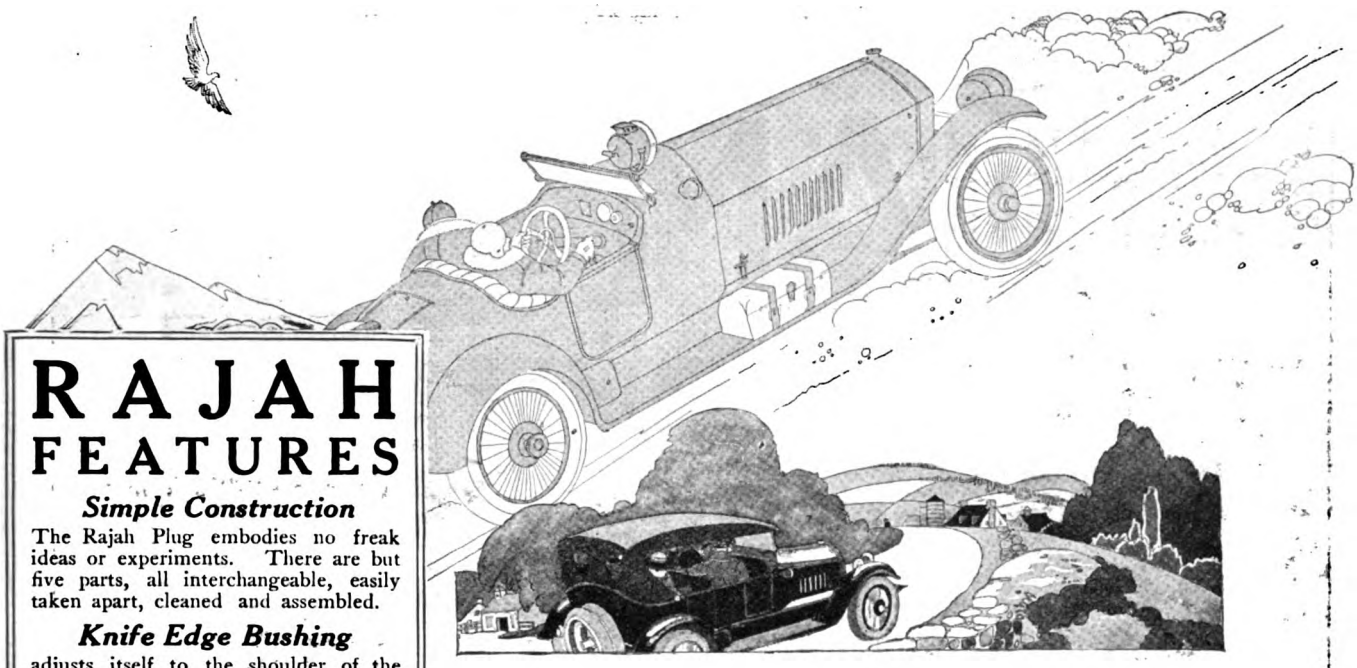
Complete Outfit, Only $1.50
With 12 Patch & Heat Units

The outfit includes the vulcanizer—six round patch & heat units for punctures and 6 oblong units for long cuts and tears. Each unit is completely assembled—a pure para rubber patch on one side and the chemically treated combustible disc on the other. No acid, gasoline, cement or flame required. Simple—easy to use—SAFE!



Sold by Accessory Dealers and Garages

Let your nearest accessory dealer show you how easily and quickly the SHALER 5-Minute Vulcanizer will mend your tubes *anywhere.*



Write for FREE BOOK, "The Care of Tires."

RAJAH FEATURES

Simple Construction

The Rajah Plug embodies no freak ideas or experiments. There are but five parts, all interchangeable, easily taken apart, cleaned and assembled.

Knife Edge Bushing

adjusts itself to the shoulder of the porcelain. All possibility of injuring the porcelain is thus eliminated when the bushing is tightened down to secure a gas-tight joint.

Insulation

consists of the highest grade, hardfire, heat-resisting porcelain, of special pattern, so assembled as to insure against firing through.

The Button Top and Rajah Clip Terminal

do away entirely with the necessity for either thumb screw, nut or other device for attaching the cable to the spark plug.

Rajah Terminals and Adapters

are furnished so that Rajah Plugs can be used on any car.

Rajah Regular Clip Terminal

Adjustable to any cable. With the extra collar supplied fits any make of plug.

Rajah Ferrule Clip Terminal

With any size ferrule required. Fits any make of plug with the extra collar supplied.

Rajah Thumb Nut Terminal

Adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman.

Rajah Stud Terminal

Adapter for Buick, Chevrolet and Oldsmobile.

Manufactured by

Rajah Auto-Supply Company
Bloomfield, N. J.

Sales Department
Edward A. Cassidy Co.
280 Madison Avenue, New York

Any old hill on high

THAT'S the proud boast of the car owner who can do it. But think of the thousands who can't! They blame the car but it's usually the spark plugs.

In every big hill climbing event Rajah Plugs have added to their reputation. They will put into any man's car a life and energy he never suspected.

Play up the hill climbing, racing and airplane records of Rajah Plugs in making sales. It is this kind of efficiency that car owners want.

Sell them in sets—a single Rajah doesn't help. It is limited by the efficiency of the others.

Your jobber can supply you with Rajah Plugs and Terminals if your stock is low.

ADAMSON

THE COMPLETE LINE OF
VULCANIZERS

Money Makers for the Dealer

Money Savers for the Motorist

MODEL "E" $1.00
5-Minute Vulcanizer
Uses Adamson Dry Fuel or gasoline. Repairs tube punctures permanently in 5-minutes.

MODEL "T" $1.50
For ordinary repairs on inner tubes.

MODEL "U" $2.00
Repairs tubes and cases. Mends tread cuts and small blow-outs.

Write for Adamson store displays and dealer helps

DEALERS:

There's an Adamson for every kind of tube and casing repair that a motorist can make. You needn't miss a single sale when you stock the Adamson line.

The high price of tires and tubes and the nation-wide demand for Conservation will practically double the number of Adamson users—now over a million.

To show Adamsons is to sell them. Every motorist knows they are easiest to use, quick and sure in results, and make the strongest possible repair.

Adamsons cost least to buy and operate; any model will use common gasoline—always dependable and easy to get.

STOP THAT LEAK

Tread cuts and surface injuries admit moisture and sand into the fabric to rot and weaken it, causing blow-outs and short mileage.

—Sell Adamsons to repair such injuries in a few minutes time, while the tire remains on the wheel.

Practically every motorist wants an outfit to vulcanize his own tube punctures and blow-outs.—Sell him the dependable Adamson to make quick and lasting repairs—at home or on the road—without the use of cement.

For quick sales and no dead stock carry Adamson Vulcanizers and Repair Gum.

Sold by all Jobbers

ADAMSON MANUFACTURING CO.

EAST PALESTINE, OHIO.

We also make Adamson Ford Brake Shoes, Lined and Unlined.

MODEL "S" 12.00
For private garages and repair shops. Mends cases and tubes.

ADAMSON REPAIR GUM
Essential for best results with any portable vulcanizer. Perfect adhesion without use of cement.

The MUNGER "ALWAYS TIGHT" PISTON RING OUTFIT—
8 Always Tight Rings (Regular Size)
4 Always Tight Rings (Overwidth)
1 Regrooving Tool
1 Ring Insertion Tool

MUNGER "Always Tight" Piston Rings

When piston grooves become slightly worn it is impossible to fit any rings in them gas-tight without first truing-up the grooves. With each complete outfit of Munger "Always Tight" Piston Rings is one *overwidth* ring for each piston (to be used in worn grooves) and a Munger Re-grooving Tool with which worn grooves can be straightened quickly and accurately without resorting to expensive lathe work, and without even disconnecting the piston from the connecting rod.

Every car owner and repair man will appreciate the great saving of time, labor and money effected by this simple method.

Ready to insert the Munger Re-grooving Tool to true-up a worn piston groove

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an over-width ring

A Munger "Always Tight" Piston Ring being slipped over the Munger Ring Insertion Tool

Showing how easily Munger "Always Tight" Piston Rings can be placed in the piston grooves with the Munger Ring Insertion Tool

The MUNGER "Always Tight" expansion joint

As soon as other rings begin to wear they begin to lose compression.

This is not true of MUNGER "Always-Tight" Piston Rings. They remain *"permanently"* gas-tight because the patent process of peening them makes them conform to the shape of the cylinder—and because the *"Always Tight" Expansion Joint compensates for wear as it occurs* without leaving any opening through which gas can escape. This wonderful expansion joint makes Munger Rings practically permanently air-tight.

"YANKEE" Ratchet Tap Wrench

Works Where Others Won't

"YANKEE" TOOLS
Make Better Mechanics

This Tap-wrench has the famous 'YANKEE' Ratchet Movements.

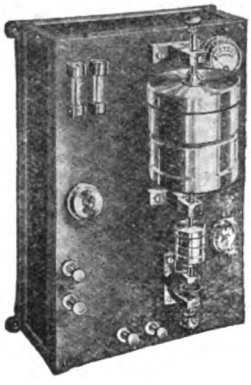
No. 250—Length, 3¼ in. Diameter of chuck, ¾ in. Holds up to 3/16 in. taps. **$1.60**

No. 251—Length, 5 in. Diameter of chuck, ⅜ in. Holds up to 5/16 in. taps. **2.20**

No. 1251—Length, 13 in.—for work requiring long reach. Same chuck as No. 251. **2.80**

Write us for the "'YANKEE' Tool Book," FREE. It illustrates and describes the many ingenious 'YANKEE' Tools for saving time and labor in the garage, in drilling and working in metal, boring in wood and driving screws.

Multiplies Man's Power



The "Ratchet" makes it easy to tap holes in close quarters and where interfering parts render it impossible to use ordinary tap-wrench without taking down the construction.

Three positions of Ratchet Shifter give Left-hand, Right-hand and Rigid adjustments, instantly adapting the tool to any situation and giving it a working efficiency unknown to other tap-wrenches.

The crossbar is held central, or at either end, by a friction device; and is entirely removable for close packing in tool chest. Knurled thumb-piece, at top, to start or back out taps quickly; provided with counter-sunk hole for using the tool on lathe center when desired.

Your dealer can supply you

NORTH BROS. MFG. COMPANY, PHILADELPHIA

GARAGES, SERVICE STATIONS, INDIVIDUAL OWNERS

For charging batteries, breaking down sulphation or for any other purpose where it is necessary to change alternating current to direct current,

The First of May Thrift Stamp Day In The U. S. A.

The Active Co-operation of Every Reader of AUTOMOBILE DEALER AND REPAIRER Is Urgently Requested To Make It A Success

May 1st, 1918, will be observed throughout the United States as Thrift Stamp Day! On that day retail stores everywhere in every line of business will ask customers to take **part of their change in Thrift Stamps!** It will be patriotic for every man, woman and child to accept at least one Thrift Stamp as change on every purchase made that day—and to make as many purchases as possible on May 1st.

Here is a big, practical way of getting millions of Thrift Stamps into the hands of the people of the United States, and of insuring the success of the Government's War Savings Stamps campaign. Thrift Stamp Day will **help everyone.** It will prove a tremendous boost to business. On May 1st, 1918, the nation should do the biggest total retail business of any single day in our history! The beneficial habit of Thrift will be sown broadcast among the citizens of the U. S. A.! Most important of all, Uncle Sam will be furnished with the sinews of War and Victory!

American business must go "over the top" **at once** in a quick drive to make Thrift Stamp Day an overwhelming success. You wholesalers, you jobbers, you salesmen, must **talk** Thrift Stamp Day among your trade, arouse the **enthusiasm** of the retailers, the storekeepers, the clerks behind the counters. Uncle Sam **needs your help.** A practical **plan** has been prepared showing how each one of you can "do your bit" to make Thrift Stamp Day a red letter day in American business annals. Write for this plan **today without fail.** Remember, in helping Uncle Sam you are helping business and helping yourselves. Address Mr. W. Ward Smith, National War Savings Committee, 51 Chambers Street, New York City.

George W. Copp Co., Inc., Formerly NEW YORK AUTO EQUIPMENT CO., Inc. Office and Factory, 351-355 West 52nd Street, **New York**

I EARNED $2200.00 IN FOUR MONTHS

THIS IS RICHARD A. OLDHAM

Mr. Oldham was telegraph operator for the Illinois Central Railroad for twenty years. He is fifty-eight years old. During all those twenty years he drew the customary monthly salary of a telegraph operator—no more—no less. One day he read one of my advertisements and the possibilities of making money in the Auto Tire Repair Business. In a few weeks he had purchased and installed a Haywood outfit, and was doing business for himself. He was **His Own Boss.** A short time ago he wrote us that his income in four months was as much as it had been in Two and One-Half years as Telegraph Operator. You men who have been left at home—who are beyond the draft age, can and must take up the burdens left behind by others. Oldham is a living example of what can be done. I have 500 places to be filled now. 500 stations where tire repairing is neglected, because there is no one to do it.

I Must Have 500 Men to fill these places within the next 60 days

I have a big interesting book to send you—a book about tires—it explains this business—gives inside figures and profit. Gives actual proof of success—letters of others who are now operating Haywood Shops and making big money. What these men have done you can do. $2500 to $4000 a year is conservative. One machine will give you a start. You can see all business around you—everywhere there are automobiles there are tires that need repairing. You know that. All you do is open a shop—put out a Haywood sign and auto owners will come to you, welcome you and the service you bring them.

Sign the coupon and mail it today, or send a post card or letter.

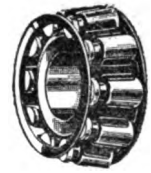
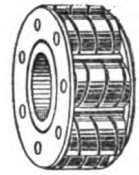
Bearings Service for *Any* Car



From the *Oldest* to the *Newest*

Can you remember the Globe Car, the Sphinx Car, the Dragon, the Chalfant, or the Great Smith?



Probably not. Yet, if an owner of one of these cars, or many others whose names have passed into oblivion should ask us for bearings service, we would be ready to supply his needs intelligently and immediately.

Manufacturers of Timken, Hyatt and New Departure bearings have provided us, their official national service representatives, with complete and authentic engineering data. With this unique information and with the complete stocks of these bearings on hand in all of our twenty-two branches, we are able to supply the bearing requirements of practically any make of motor car, motor truck or tractor.

In addition to our twenty-two direct branches situated in the most important automobile centers of America, there are several hundred agents representing us in smaller cities and towns. These agents are equipped to give you expert advice and supply bearings for repair and replacements in a prompt and reliable manner.

S-M-C

Trade Mark Registered U. S. Pat. Office

ASBESTOS BRAKE LINING

Silent Sturdy Slip-Proof

Master of Every Motoring Emergency
Cannot Burn, Glaze or Crumble

The letters **S-M-C** on a roll of brake lining protect the man who buys, the man who sells and the man who equips the car.

Look for those letters—**S-M-C**—insist on them.

S-M-C means **Safety Made Certain.**

Absolutely certain; because right materials, rightly treated and tightly woven make this the real asbestos brake lining.

Made in rolls, of all widths up to 6 inches.

In the Garage Business, Today, Reputations Are Built on Service, and the Very Foundation of Garage Service is a Dependable Air Compressor

INVESTIGATE THE BRUNNER AIR COMPRESSOR

Garagemen who investigate the air compressor field thoroughly before placing their order invariably select the Brunner because they find a predominance of Brunner Air Compressors in the successful neighboring garages and the users always gladly recommend the Brunner, which has rendered high-class service and helped them in building up their reputation.

Years of dependable and efficient service in the garage have built up an enviable reputation for the Brunner Air Compressor, which is being maintained by the continued dependability of Brunner Compressed Air Service.

Dependable Compressed Air Tanks and Fittings Are Just as Necessary as an Efficient Air Compressor

A leaky needle valve, tank or air hose will reduce the efficiency and shorten the life of a good air compressor as well as add to the operating cost—and an improperly constructed air tank, an inaccurate air gauge or an unreliable safety valve will render a compressed air plant absolutely dangerous.

Brunner Compressed Air Tanks and Fittings Are Both Safe and Reliable and will permanently increase the Efficiency of Any Imperfect Installation

A length or two of Brunner "Resistoil" Air Hose would permanently reduce this item of expense and convince any garageman that it is by far the best air hose obtainable.

Our new No. 15 Catalogue is the most complete and comprehensive book of its kind ever published. We will be glad to send you the catalogue and the name of the Brunner Jobber who covers your territory.

DEALERS: Get our distributing terms and quotations on the greatest selling specialty in America. Write today.

LAUREL MOTORS CORPORATION, ANDERSON, INDIANA

Made in the "Puncture Proof" City

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

BIG TIRE PROFITS
FOR DEALERS WHO SELL
KIMBALL TIRES

"Straight Side" Type shown above. Also made in Clincher Type.

Read This, Mr. Dealer:—

Don't you want to make some real tire money? Then stop handling a few high priced tires that sell slowly and tie up your capital. Meet the cut-rate tire dealers on their own ground. Sell new clean firsts at the prices others get for seconds. Do a big business and turn over your capital several times a year.

KIMBALL TIRES are built to meet the demand for *good* low priced tires. Big dealers in New York, Chicago and other large cities are making more money on this kind of tires than they can make on high priced goods. Why don't you do the same?

You can't compete with the factory branches, distributors and preferred dealers on high priced tires. You can't compete with the mail-order and cut-rate houses on seconds. SELL KIMBALL TIRES and you can beat them both.

There is room for a live KIMBALL dealer in every city and town in the United States. We allow only one dealer in each territory to sell KIMBALL TIRES. Many exclusive KIMBALL dealers are now doing a big business but there is still choice territory to be had. But it is going fast.

Get in touch with us. Send sample order at once. We guarantee our tires to be new firsts and will refund your money if tires are returned in five days in the condition in which they were received. Don't delay.

THE PRICES SPEAK FOR THEMSELVES

	Non-Skid	Tubes
30x3	$ 8.25	$1.90
30x3½	10.35	2.15
32x3½	12.45	2.25
32x4	16.45	3.05
33x4	17.55	3.10
34x4	18.25	3.20

Do you want Clincher or Straight Side?

The Kimball TIRE & RUBBER CO.

Dept. B **1467 Michigan Avenue CHICAGO**

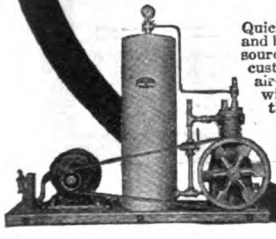
Don't delay. Mail your order today

WINTER BUSINESS—COLD WEATHER MADE PROFITABLE.

CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference



Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current

Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

STENMAN ELECTRIC VALVE GRINDER

The STENMAN ELECTRIC VALVE GRINDER bears the same relation to hand grinding that the vacuum cleaner does to the old corn broom method of carpet cleaning. Once tried it is indispensable. Ten days' usage and it has paid for itself.

Our Patents Are Basic and Will be Protected. Patented

Mull that over a moment—Visualize it—Don't you sense the possibilities of what this device means to you?

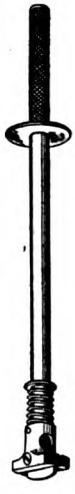
Repair Shop Profits Are Made on Labor

YOUR REPAIR SHOP REQUIRES IT EFFICIENCY CALLS FOR IT
YOUR CASH DRAWER DEMANDS IT

The STENMAN will grind a set of eight valves in 20 minutes. Whereas, it takes two hours or more to grind them by hand. And we guarantee the Stenman to do a better and more even job. Also—that a novice can operate it.

Plugs in on any lamp socket—A. or D. current. Regular stock 110, 130 volts. Made for higher voltage where required.

After the most severe tests and tryouts had been made by their engineers, these Grinders have been bought and are in use by the U. S. Army, Naval, Aviation and Postal Departments. Also, by the U. S. Steel Corp., Standard Oil, Gulf Refining, Western Electric and many up-to-date garages and shops on the East.



The universal use of the STENMAN ELECTRIC VALVE GRINDER is limited only to our ability to supply them.

An Interesting Distributing Proposition to High Class Jobbers Where We Are Not Already Represented

The Stenman Electric Valve Grinder Co., Inc., 42 Southbridge St., Worcester, Mass.

GET THESE MONEY MAKERS

Hudson Universal Jointed Valve Grinder

No more "botch work" or grinding cylinders only on one side.

This Valve Grinder does not keep you guessing—it goes straight to the mark!

It does such a thorough job of valve cleaning and grinding that you'll wonder how you ever got along without it.

Especially useful in grinding the valves on fourth cylinder of Ford engines or V type motors.

Price - - $1.50

Hudson Crank Case Repair Arm

FOR FORD CARS

The greatest time saver known!

Take the short cut to crank case repairs—eliminate the "long winded" route and put the extra profit in your pocket.

Don't remove the engine from the chassis—simply loosen four bolts, slip the "quick and easy" Hudson Repair Arm in place and tighten—thus in a few minutes you have made the repair.

Price - - $1.50

PATENT WILL BE OFFICIALLY ISSUED BY PATENT OFFICE APRIL 23, 1918.

Open your doors to the steady and profitable sale of

Temme

SPRINGS FOR ALL CARS

DO all the lame cars drive to *your* door for Temme Springs and other things?

In most good towns, Temme Springs and Temme's Triple Action Service are known to be *as good as gold.*

Hundreds of repairers, who have "banked" on Temme and never lost, are putting up Temme highway signs today.

These signs *will* bring in business. Temme has tried them, so he *knows.* And now he offers *you* what won for him.

Temme Springs *"for all cars"* means just what it says—for all cars *since 1902.* Test us by naming the spring you need. Temme Triple Action Service will have it on the way to you the same day.

"For all cars" means *designed* for all cars to factory specifications. And so good are Temme Springs—so prompt the service—so fair the prices—that dealers in *all* cars now buy from Temme in *preference* to the car maker.

You need these springs, this service, these signs. They will make you money, bring new business, help you build the good reputation you are after.

If you delay you may lose this exclusive proposition. Write or wire us now, saying: "Send Temme Spring Service Station proposition at once."

A PATCH

That Will Not Loosen, Leak Creep or Blow Out!

20th CENTURY
Self-Vulcanizing Patch

Makes Permanent Repairs Instantly, and Without the Use of Heat or Tools

It is a three-ply Patch, using a ply of raw Red Rubber next to the inner tube, which guarantees a quick, smooth job of vulcanizing; then a ply of semi-cured rubber next to the khaki cloth. This rubber is not affected by the heat and will not melt, making our Patch absolutely **Leak-Proof**; then comes the ply of best grade khaki cloth, which gives the Patch its strength and durability.

Leak-Proof

This Construction Makes a Patch We Guarantee Not to Loosen, Leak, Creep or Blow Out, and to Give Satisfaction in Every Respect.

Made in 4 sizes	2¼ x 16— 36 Square Inches	$0.50
	4 x 15— 60 Square Inches	.75
	6 x 18—108 Square Inches	1.50
	7 x 75—525 Square Inches (Garage Size)	4.00

"NORMA"

"NORMA" BALL BEARINGS

(Patented)

The "nerve centers" of the car and truck—so may be defined the ignition and lighting apparatus. Weakness, inadequacy, at these centers reacts throughout the machine. Failure at these points means a failure of all the nerve-controlled functions of the car or truck. Can a car, truck, or man show "stamina," with an inherent weakness at the nerve centers?

"NORMA" Ball Bearings, by their superlative speed qualities and proved serviceability, contribute mightily to the rugged strength and service capacity of those high-grade magnetos and lighting generators which are the "nerve centers" of all cars and trucks of proved dependability.

Be Sure—See that Your Electrical Accessories are "NORMA" Equipped

THE NORMA COMPANY OF AMERICA

1790 BROADWAY NEW YORK

Ball, Roller, Thrust and Combination Bearings.

"NORMA"

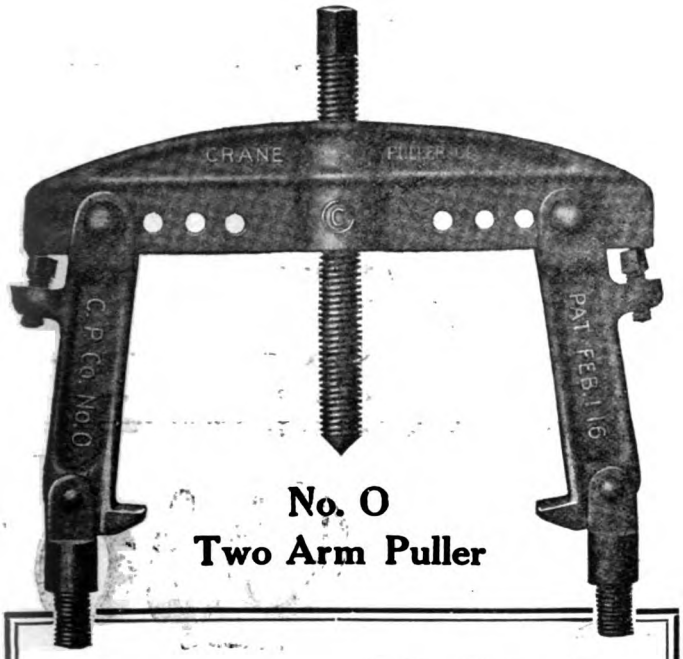
In emergency relief work—where life and death preclude "taking chances" on *any* part of the equipment — invariably Reflex Spark Plugs are used. And it is such facts that make sales for Reflex dealers.

REFLEX equipped White Truck fitted for Emergency Mine Rescue work. An example of REFLEX responsibility.

REFLEX SPARK PLUGS

KEEP THE CAR ON THE GO!

They "Keep the Car on the Go" because *every* Reflex you sell is just as reliable —has been subjected to the same rigid tests—as those used as standard equipment on the White Mine Rescue Truck shown above, and on the thousands of Whites at the war fronts and in industries, everywhere.



Chromite War-service Porcelain and Non-pit points are used in Reflex Spark Plugs. We authorize you to guarantee any type of the complete Reflex line on a money-back basis.

Write today for our exceptional dealer proposition. Sell the line of Spark Plugs that is based on actual performance.

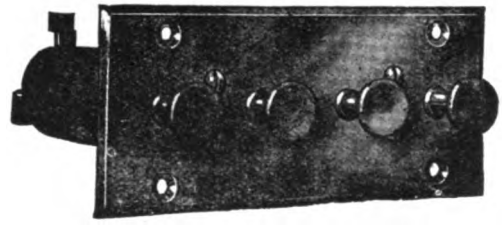
Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.



One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS
The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.

HEAD, SIDE AND TAIL LIGHTS
Head and tail lamps on and off together. Side and tail lamps on and off together.

DASH LAMP
Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

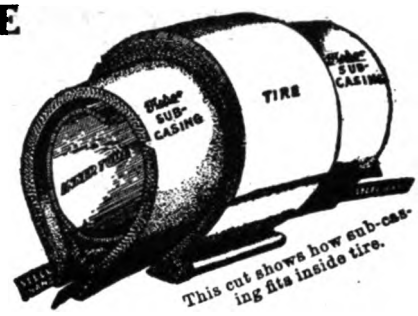
THE Fisher PATENTED "RIM-GRIP" SUB-CASING



MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

This cut shows how sub-casing fits inside tire.

A patch with selling arguments

THE progressive dealer sells Firestone Accessories because their quality gives him some very definite reasons why his customers should buy them. There is a special list of good things to say about

Firestone Cementless Tube Patches

They are easy to apply but you can't pull them off. For proof of this ask your customer to hold a tube patch which has been attached to another one in your hand. Now both together, pull. The patches will hold fast.

Ask the buyer to notice that these patches are hand-buffed and feather-edged; they will not pucker or creep. Ask him to notice, too, how easily he can remove the muslin by means of the small tab on the patch.

It's just this way all through the line of Firestone Accessories. It includes every emergency need, saving time and tire-money. Write for details.

Automobile Dealer AND Repairer

A JOURNAL OF PRACTICAL MOTORING

Registered in the U. S. Patent Office

VOL. XXV. No. 2. NEW YORK, APRIL, 1918. PRICE {10c. PER COPY / $1.00 PER YEAR

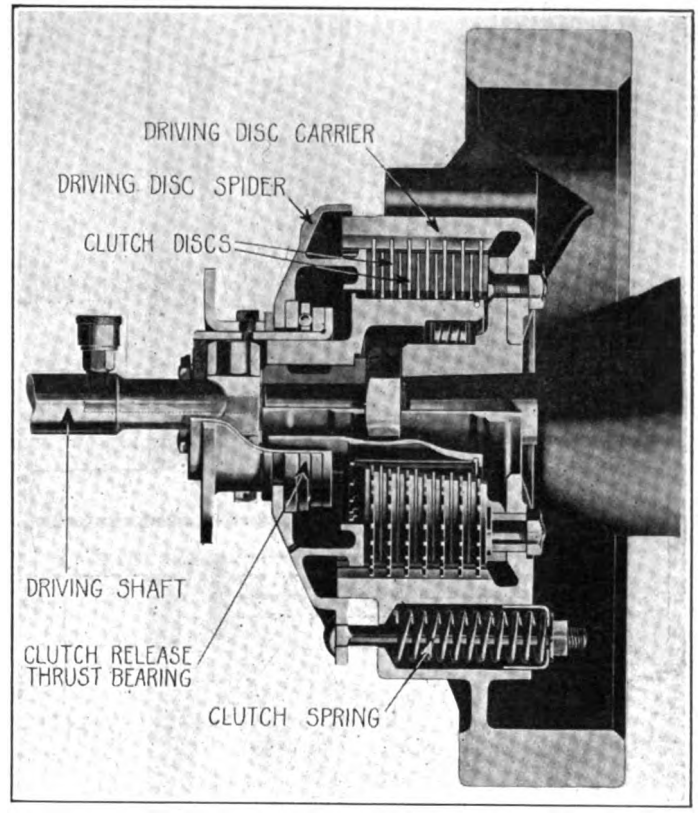
Overhauling the Automobile to Put It Into Condition for the Coming Season

Dealing with the Overhaul of the Electrical System, the Ignition Units, the Methods Used for Timing and the Disassembly of the Clutch

In our March number we took up the removal of the engine and its overhaul, giving special attention to the pistons, cylinders, and the lubricating system and covered much of the overhaul as far as the engine units were concerned. The amateur repair man should not try to overhaul the electrical system in so far as the generator and motor starter are concerned. He should try to remove these units without disturbing them and if there are any regulating devices such as voltage regulators, or generator cut-outs, he should remove these very carefully, so as not to disturb the setting. All repairs to the electrical system should be made by experienced electricians or those accustomed to this sort of work. The magneto in some cases may be repaired by the amateur, but as a general rule this unit should be repaired at the factory, or by an experienced man. Practically the only part of the magneto that ordinarily requires repair work are the breaker points. These often wear into rough ridges, or are burned so that they do not make proper contact. Wherever possible the breaker points should be flattened with a very fine piece of emery cloth or a file, so that they contact across their full face.

After they are replaced they should be so arranged as to separate about .002 when the arm rides on the hill of the cam. In putting the magneto back on the engine, the breaker points must be timed so that they will snap apart at the proper moment, or the engine will not function properly.

Magneto Setting.



A good rule to follow in setting a magneto, which is fitted with a fixed spark, is to mesh the magneto gears so that the spark will occur at dead top center of the explosion stroke. This setting gives the maximum possible advance and does not result in a back fire or kick of the engine. In setting a magneto which has a spark advancing mechanism, the spark advance should be fully retarded and the breaker points set so as to separate at dead top center of the explosion stroke. This gives one the opportunity for advancing the spark the full range of the mechanism.

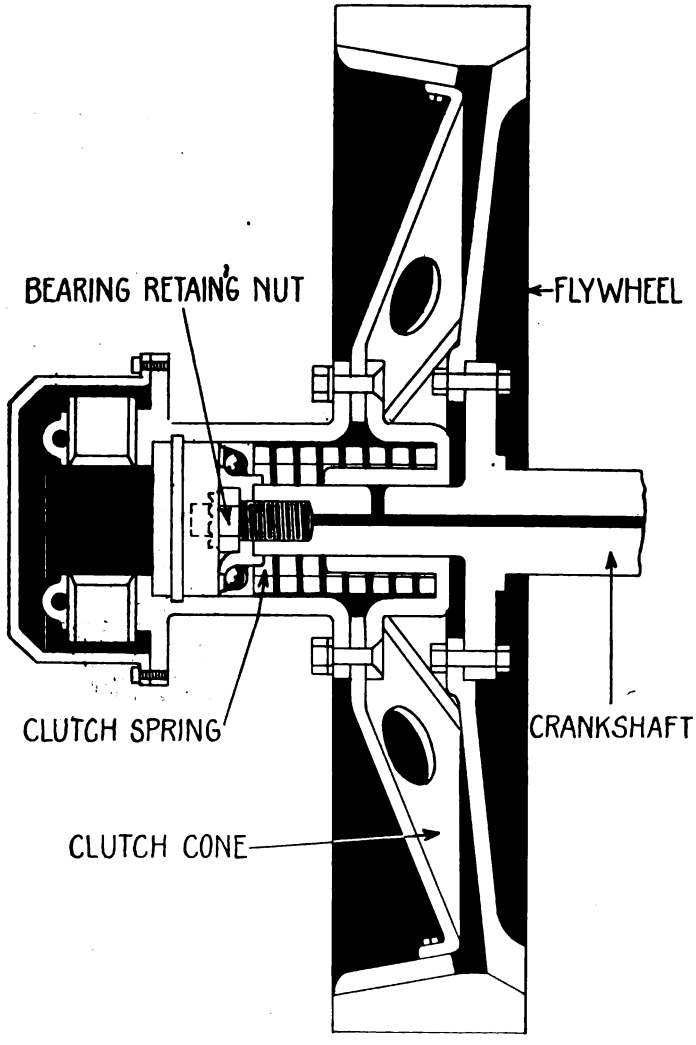
Battery Systems.

Cars equipped with battery ignition systems or coil systems, but not magnetos, are usually fitted with some sort of a combined breaker and distributor box, which very much resemble the magneto parts with the same name.

Systems of this type as a general rule are set in the same way that the magneto is timed, as regards spark advance and retardation. That is, the breaker points should separate at, or very shortly after, top center, with the spark fully retarded.

Most of these devices are so arranged that the gears may be meshed and the timing altered, either through a coupling between the driving gear and the timer, or in the breaker box cam itself.

Sectional View of Reo Disc Clutch Showing Principal Parts Referred to in Text.



In caring for magneto or battery breaker boxes and distributor units, one should use only the best lubricating oil and very little of it. The oil should be smeared upon the breaker cam with the fingers, in a very thin coating. The distributor should never be oiled, but greased, unless otherwise directed, with an extremely small amount of pure vaseline. The vaseline should be rubbed on the metal bars and all surplus wiped off with a clean cloth.

There are two general classes of carburetors on

Digitized by Google

the market, the first having a fuel and air inlet controlled by outside setting and the second having a set fuel nozzle, which cannot be altered by any hand adjustment. In either case when overhauling the engine the carburetor should be taken from the car and thoroughly cleaned. The float bowl or cover should be taken off and all of the small passages cleaned with a fine wire, being very careful not to scratch any of the valve seats. In cases where a carburetor is fitted with outside adjusting devices, one should carefully make note of the adjustment positions, just how many turns are given the gasoline needle valve and just how many turns the air adjustment is opened or closed. If this is done one will have very little trouble in readjusting the carburetor.

In readjusting the carburetor, if one does not remember just how the outside adjustments were set, one should cut off most of the air entering, and open the needle valve about one and one-half turns, then try to start the engine. If the engine will not start under this adjustment the carburetor should be examined and if there are evidences of an oversupply of gasoline, the air adjustment should be opened so as to allow more entering air, or the needle valve closed to one turn. The action of the engine when starting

Sectional View of Typical Cone Clutch. The Removal of the Bearing Retaining Nut Permits the Disassembling of the Unit.

is an indication of the proper carburetor setting. If the engine acts "logy" or sluggish it is an evidence of an oversupply of gasoline, and the gasoline should be turned off very slightly until the engine accelerates readily with the opening of the throttle.

Adjusting the Carburetor.

In making an adjustment of this kind, the spark advance, that is, if the engine is fitted with such a device, should be advanced about half way on the quadrant. If the carburetor is fitted with two adjustments, a low speed and a high speed, the low speed adjustment should be made first and the engine should run at 200 turns per minute or less without missing fire.

In every case adjustment should be made as closely as possible, that is, the engine should be run at a certain speed and the gasoline turned off slowly until the engine speed decreases. This is the only way to get maximum efficiency.

After the tentative, or first adjustment has been made, the engine should be run until it is warmed thoroughly and the adjustments all made over again, for a cold engine cannot be adjusted to give any degree of satisfaction.

The Transmission.

We now come to the second most important part of the car, the transmission section, consisting of the clutch, the gear-set and the rear axle. The methods of overhaul of these three units vary greatly according to the type of units used. Where a garage is fitted with a device for lifting, or where one may obtain sufficient assistance, the engine clutch and gear-set, if in unit, may be removed from the chassis at the same time. Most of the cars on the market are so designed that the engine and clutch, which is usually located in the flywheel, may be removed as one unit, leaving the heavy gear-set separate in the car itself, or supported on a box or block.

Clutch Types.

There are two general types of clutches, the disc and cone. Of the two types, the cone is perhaps the simplest and is removed the easiest, and so we will consider this type first. In the cone, the flywheel usually forms the outside of the unit, while the inside or cone forms a second part, and is firmly attached or keyed to the driving shaft or gear which drives the gear-set.

Cone clutches may be divided into two classes, those which are operated by a large coil spring at the center and those which are operated by small coil springs placed upon the circumference or web of the clutch itself. Those which are fitted with a large spring at the center are, as a rule, retained on the crank shaft by a lock ring or a large nut. In the former case the lock ring may be detached from the crank shaft and the clutch arm slipped out, taking with it the large coil spring which must be removed under a heavy press or in a large vise. Under no condition should the clutch unit be disassembled on an open bench, for in this case the many hundreds of pounds pressure contained in the compressed spring would result in injury to the repair man, were he to release it suddenly. Should one find that the clutch spider is retained on the crank shaft by a large nut, he should observe great care before removing the nut for he will be apt to release the spring and be badly injured. Clutches of this type can only be disassembled with proper tools.

Clutches of the Second Type.

Where the clutch pressure is obtained by small springs placed on the periphery or web the smaller

Digitized by Google

springs may be removed one at a time, by the use of a Y bar, using a piece of bent iron or a rope as a fulcrum. The smaller springs do not have the expansive power that the larger one does and can be removed easily by the amateur. After the spring or springs are removed the clutch may be entirely disassembled and the fabric facing examined.

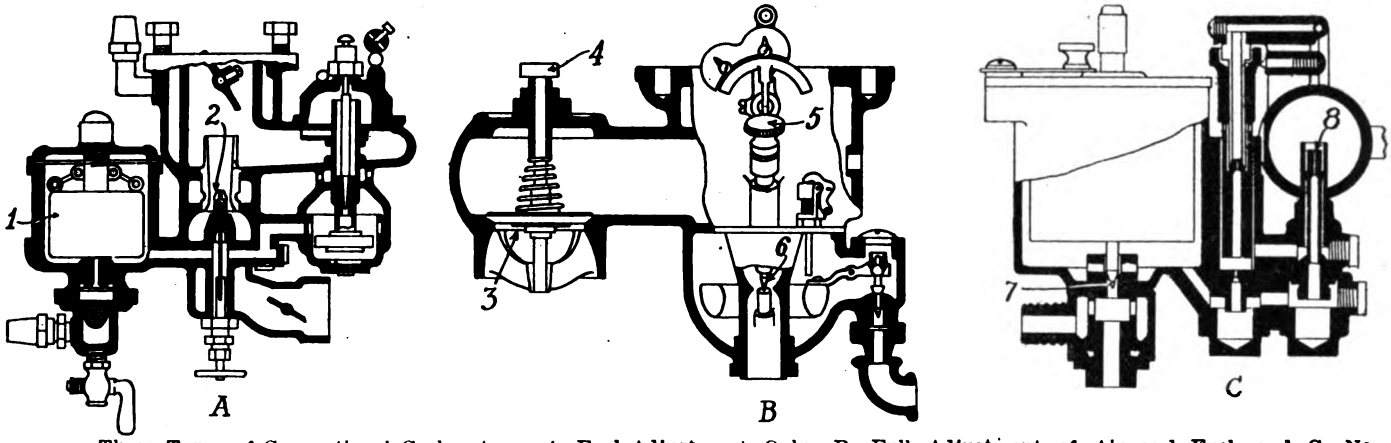
Clean the Fabric.

This fabric should first be cleaned thoroughly by the application of kerosene and the liberal use of a stiff scrubbing brush. This will remove all of the oil which may have accumulated, and one may then be able to see the condition of the fabric. Should the fabric appear worn, it should be replaced with new. New fabrics may usually be obtained at the service station and in replacing fabrics one should be extremely careful to sink the rivet heads below the surface of the fabric, or uneven clutch action will be the result. If the old fabric is to be used again, it should be cleaned as above directed, and if it is leather, softened by the application of neatsfoot oil, not lubricating oil.

With the clutch removed from the flywheel a careful examination should be made of the flywheel fastenings and if this member is riveted to the crank shaft flange, the rivets should be tightened if necessary for it is vitally essential that the flywheel be fastened firmly to the crank shaft.

Disc Clutches.

Clutches of the second-class, that is of the disc type, are divided into the same two classes as those of the cone type in so far as the coil springs are concerned. The clutch used on the Reo car is illustrated herewith, and has the springs placed at equal distances in the clutch drum. As a general rule disc clutches may be removed as an assembly from the flywheel by the removal of the large nut on the end of the crank shaft. The clutch assembly may then be disassembled by the removal of the smaller retaining nuts, which hold the springs, and the nuts on the ends of the studs which hold the so-called clutch spider into place. As cautioned in the cone clutch type directions, one should never remove the large center coil springs except beneath an arbor press. Disc clutches are usually faced with some sort of fabric which may be cleaned in the same manner as directed for the cleaning of cone fabrics and the same directions apply.



An important part of the clutch is the release thrust bearing usually of the ball type having two heavy thrust washers. This bearing should always be examined for wear and in event of excess wearing of the thrust washers, should be replaced with new, for unless this is done, sooner or later one will have considerable trouble in releasing the clutch. Wherever any grease or oil channels occur, they should be cleaned carefully with fine wire and liberal applications of kerosene oil.

Before assembling the clutch unit, all of the bearings should be tried in their respective places and the fit noted. It is essential that there is but very little play in the clutch, for if there is, the continued racking of loose parts will very shortly damage the mechanism. Bearing side play may be remedied by the replacement of the sleeves with new or the fitting of new bearings. End play may be compensated for by the insertion of bronze or steel washers of the required thickness.

A common cause for trouble in a multiple disc clutch can be traced to the sticking or catching of the disc in the slots or on the keys which transmit the power to the discs. Each clutch disc should be tried in its place before assembling the whole and the clearance between the keyways and keys noted. If the slots are all smooth and the fit is true, the clutch will probably give satisfaction. If, however, there is too much play between the discs and the carriers, at every clutch engagement the plates will receive considerable wracking, and will soon wear out.

The bolts, with which the assembly is bolted to the flywheel should be absolutely tight and permit no play between the parts. In event of any play, the bolts should be replaced with those of a size larger and the holes reamed to fit.

Where clutch members are keyed to the shafts, keyways and keys should be examined for wear and new or larger keys put into the clutch in place of those worn.

Three Types of Conventional Carburetors. A, Fuel Adjustment Only; B, Full Adjustment of Air and Fuel, and C, No Adjustments. Number of Parts as Follows—1, Float; 2, Needle Valve; 3, Auxiliary Air Valve; 4, Air Valve Adjustment; 5, Needle Valve Adjustment; 6, Needle Valve; 7, Float Valve; 8, Fuel Nozzle.

Baker Electric Advances in Price.

The Baker R. & L. Company announces an advance in price of their Brougham type of car of $150 and their Coach type $200, making a total cost of the first of $3,150 and the second $3,400.

In making this advance the Baker R. & L. manufacturers call attention to the fact that despite the increase in the cost of materials and the increased prices of labor, they have kept their prices uniform for the past ten months.

Billions of Barrels of Oil Locked Up In Oil Shale

A Discovery Which Has Disclosed One of the Country's Greatest Mineral Resources of Crude Oil, Gasoline and Ammonia

BY GUY ELLIOTT MITCHELL
Of the United States Geological Survey

Unfortunately the discovery of the immense oil resources of America, contained in its oil shale deposits, will doubtless be attended by misfortune for the unwary—those who invest carelessly in the stock of fake "wild-cat" oil companies, organized by get-rich-quick schemers who are intent upon exploiting the gullible public rather than the development of oil-shale properties. Such schemers, like camp-followers, appear in the wake of every great discovery of mineral wealth, and they have always found the "oil fields" a particularly lucrative one for their operations.

Is the United States facing a gasoline famine? Shall we be required to forego automobiling except to meet the stern necessities of war and of utilitarian traffic? Are our petroleum fields showing signs of exhaustion?

The output of petroleum has not yet begun to diminish; statistics show that it is still increasing; yet the downward trend of production from the present oil fields is plainly in sight.

The war has made a sudden and enormously increasing demand on the oil fields of America, and though the industry has never been so feverishly active as it is now and the output never so large, the truth is that the demand has not been entirely met. And during the next year and as long as the war lasts, the demand will be ever increasing, ever more pressing.

Many of the host of larger vessels that we are now building will be equipped with oil burning furnaces, and the vast swarm of airplanes that we are building, as well as the thousands of war automobiles and trucks that we are turning out, will consume an enormous quantity of gasoline. Yet no great new oil regions comparable with the mid-continent or California fields are being discovered, and it is questionable whether any will be, for our oil geologists have pretty thoroughly combed the accessible oil areas. What, then, is the answer?

It is just at this juncture that we have made a discovery that has disclosed what is, undoubtedly, one of our greatest mineral resources—one that should supply the needs of the war, and that for generations to come will enable the United States to maintain its supremacy over the rest of the world as a producer of crude oil and gasoline and incidentally of ammonia as a highly valuable by-product. We have discovered that we possess mountain ranges of rock that will yield billions of barrels of oil.

For many years travelers going west through the Grand River Valley of Colorado and into the great Uinta Basin of eastern Utah have looked from the windows of their Pullman cars on the farstretching miles and miles of the Book Cliff Mountains, little realizing that in these and adjoining mountains, plainly exposed to view, lay the greatest oil reservoir in the country—the oil shales of Colorado, Utah, Wyoming and Nevada.

Rocks That Burn Freely.

These shales, it is true, were known to yield oil. Campers and hunters in building fires against pieces of the rock had been surprised to find that they ignited and burned. This fact was looked upon, however, as only another of the natural curiosities of the great West, and investigation showed that little or no attention was paid to it because of the seemingly inexhaustible pools of crude petroleum found elsewhere under great areas.

In connection with its investigations of the undeveloped mineral resources of the country the United States Geological Survey has recently made special studies and tests of these oil rocks and has brought to light two important facts: First, that our western shales are phenomenally rich in oil; and, second, that in foreign countries, particularly Scotland, much inferior shales are today successfully mined and worked as a source of oil and other commercial products. The industry in Scotland is 70 years old and is still in a highly flourishing condition.

Oil Profitably Distilled From Shale in Scotland.

The Scotch shales run only about 25 gallons of oil to the ton; yet the principal operating companies competing with the petroleum industry pay annual dividends, averaging 18 per cent. Rock producing even as low as 20 gallons of oil a ton is yielding good dividends. The shales in the western United States are far richer in oil than those of Scotland. Many tests made by the Geological Survey show that the American rocks contain 40 to 50 gallons to the ton and those in one deposit tested 90 gallons, or more than two barrels to the ton.

To extract the oil, the rock is distilled at a low temperature. So simple is the process that the geologists who surveyed the fields carried small testing retorts around from place to place to determine the oil content of various specimens.

In the Scotch plants the rock is heated in retorts arranged in banks of four over a single fire-box, and a unique feature of the process is that the gas derived from the shale is the fuel, used for obtaining the oil and other products. The retorts are grouped in benches of 64 and each retort reduces 4 tons of rock a day. Some 3,000,000 tons are treated annually. The vapors pass from the retorts into condensers in which the crude oil is deposited, and then on into a chamber in which the ammonia is collected.

Quantity of Oil in American Shales Enormous.

The total production of petroleum in the United States up to 1918 has been 4,255,000,000 barrels, and the possible future production, or the total reserve in the ground—and some of it lies very deep—is estimated by the Federal Government at about 7,000,000,000 barrels.

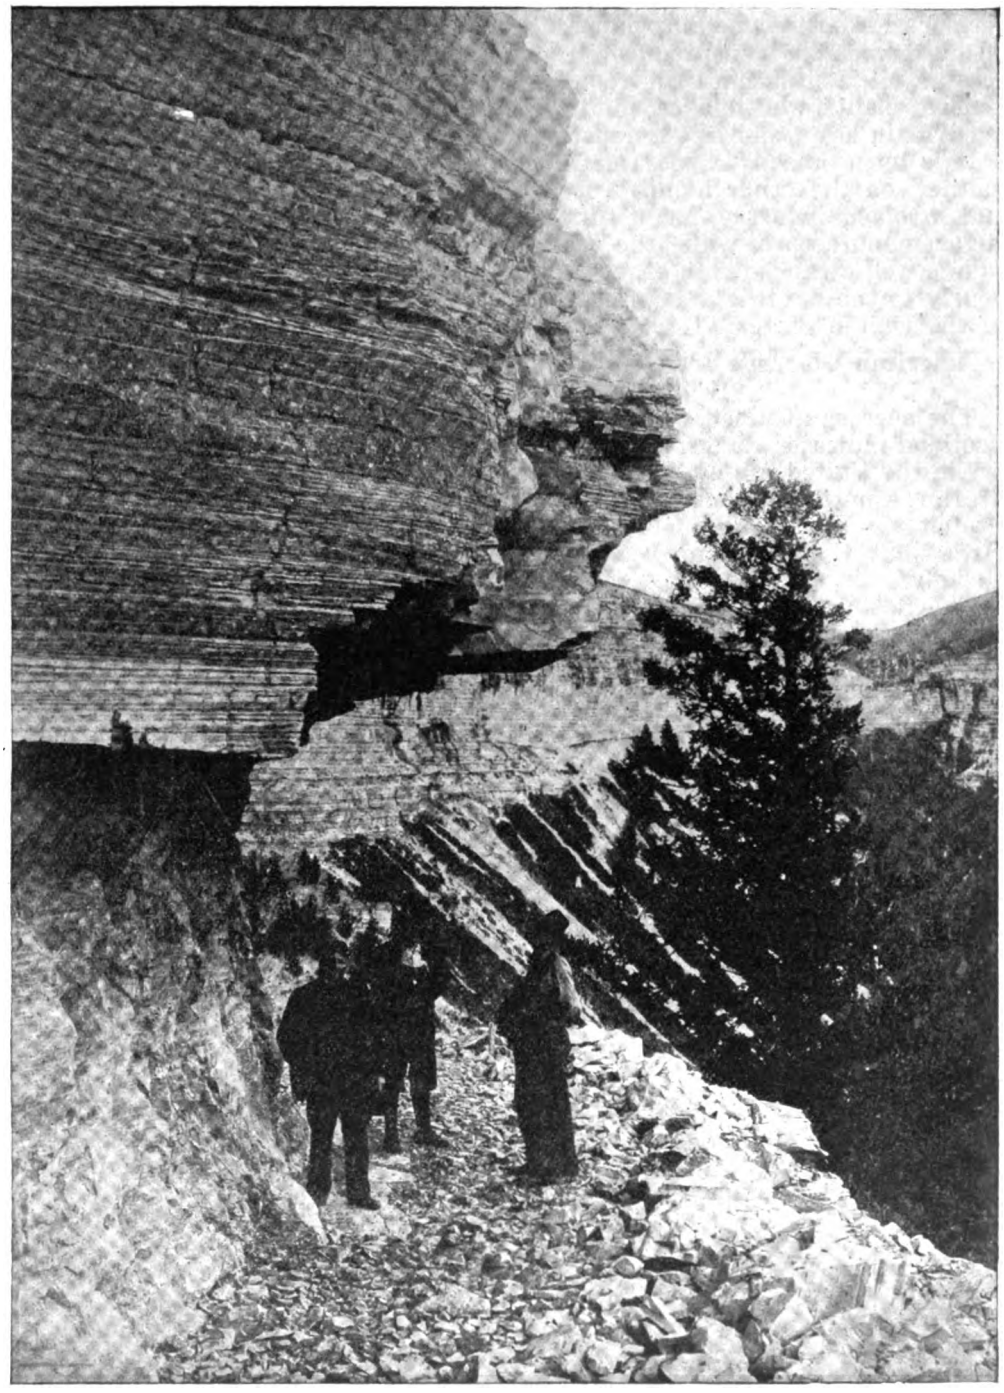
How does this petroleum compare with the known

Digitized by Google

oil-shale reserve? The quantity of oil that can be extracted from the shale is so huge that the petroleum reserve becomes almost insignificant by comparison. As a result of only a partial investigation, it is estimated that the oil in the shale ranges of Colorado alone amounts to 20,000,000,000 barrels. There are mountains—indeed, ranges of mountains—which for many miles carry thick beds of rock that yield 30 to 50 barrels of oil to the ton.

More recently the state geologist of Colorado has reported that in northwestern Colorado beds of commercially workable rock that average more than 20 feet in thickness and that will yield at least 36 gallons of oil to the ton are found in an area extending over 1,500 square miles. These figures show a content of 24,000,000 barrels of oil to the square mile or a total of 36,000,000,000 barrels for the area. Either twenty billion or thirty-six billion is sufficiently impressive.

The Geological Survey also estimates that 300,000,000 tons of sulphate of ammonia, worth, at before-the-war-prices, about $60 a ton, could be recovered as a by-product in the extraction of the oil. This by-product would be sufficient to enrich most of the farms in the great Mississippi Valley.



In addition to the oil rock in Colorado, that of Utah must be considered. The Government is now investigating these deposits in detail and has already stated that they are probably as extensive as those in Colorado and are equally rich in oil. Oil shales have been examined also in Nevada, Wyoming, California, Montana, and other States. Tests of specimens from Wyoming show from 30 to 50 gallons to the ton, and samples from Nevada have produced from 40 to 100 gallons of oil to the ton. One 10-ft. bed in Nevada yielded oil at the rate of 13,000,000 barrels to the square mile.

But the West has no monopoly of the oil-shale resources. Deposits have been examined by the government in Illinois, Kentucky, Ohio, Pennsylvania, Tennessee, West Virginia, and Indiana, some of them testing out with a high oil content. An examination of the black shale of southwestern Indiana shows that it underlies about 16,000 square miles, and although the oil content of much of it is less than that of the western shales, and some of it is too low in oil to be worked commercially, the actual content for the area in Indiana alone would be 100,000,000,000 barrels.

Some of the eastern shale that is very rich in oil overlies extensive coal beds, which are being mined by the "stripping" method, so that the oil rock must be removed in any event to get out the coal. This shale could, therefore, be mined by steam-shovels without additional cost, as it is a necessary preliminary to the coal-mining.

The potential value of this immense oil resource of America is almost beyond comprehension. Enough oil is held in these natural reservoirs to fill many times over every tank, cask, barrel, can, and other container of every kind in the world.

Until recently the oil shales of the United States,

Rich Oil Shale Ledge Outcropping near Grand Valley, Colo

Digitized by Google

particularly those of the Western States, have been referred to by the government geologists as a reserve available for extraction whenever the demand and the price shall become great enough to warrant the establishment of a new industry to supplement the supply of petroleum from the oil fields. This time is now at hand.

The extraordinary demands of the war are already indicating the approaching insufficiency of the output from our petroleum fields, and experiments in the utilization of oil shale are already being made in Colorado. Plants are being erected, oil is being distilled, processes are being tested and a steadily increasing output is soon to be expected. So substantial is this resource considered that the government has set aside as a special reserve for the American Navy 132,000 acres of the richest oil-shale land in the West.

It is not to be understood, of course, that any farmer or rancher who may happen to have oil shale on his homestead can produce oil at a profit. Successful oil distillation will require large and expensive plants well financed and scientifically managed, as in any other large industry.

It is by no means a poor man's proposition; but neither, on the other hand, is it a highly complex and involved industry, such, for instance, as beet-sugar manufacture, while the fact that oil distillation is well established in other countries is tremendously to the advantage of prospective development in the United States.

American Oil-Shale Industry Will Far Outstrip Scotland.

The success attained by the oil-shale industry in Scotland indicates far greater success for the industry in the United States. Not only is the oil content of the American deposit larger than that of the Scotch—in some cases more than three times as large—but the American rock can be mined more cheaply.

The Scotch shales lie far below the surface and must be mined by hand and hoisted through shafts like coal or hauled up inclines. Most of the Rocky Mountain shale lies from a few feet to 2,500 feet above the valley floors, and much of it can be mined in a wholesale manner by steam-shovels and lowered by gravity to the reducing plants.

Oil Formerly Distilled From Shale in Pennsylvania and Utah.

The Scotch shales occur in irregular beds which here and there thin out and have been thrown into geological faults and folds that greatly increase the cost of mining. The western shales, on the other hand, are more uniform in thickness and lie in a horizontal position. Despite their handicaps, the Scotch deposits are worked at a large profit, yet their average content of oil is only about 25 gallons to the ton, whereas vast quantities of easily mined American shales that lie in benches 6 to 10 feet thick will average perhaps a hundred per cent. more oil.

Oil-shale distillation is not new in the United States; yet it is doubtful if there are many people alive who remember anything about the earlier industry. Before petroleum was discovered in Pennsylvania, about 50 small companies in the eastern United States were crudely distilling oil from shales; but after subterranean pools were discovered these companies went out of business.

Long ago the Mormons also distilled oil from shale near Juab, Utah, where the ruins of an old still can yet be seen. We are now about to return to this discarded industry and produce hundreds of millions of barrels of oil where formerly the output was comparable to the production of oil from sperm whales.

America's Immense Mineral Wealth.

The discovery of these vast deposits of oil-bearing rock in the United States, the petroleum content of which can be estimated in nothing less than hundreds of billions of barrels, is one more evidence of the abounding wealth of the North American Continent. No sooner does one of our resources show limitations in production and the pessimists begin to cry, "What shall we do when our reserve is gone?" than immense additional deposits or satisfactory substitutes are discovered.

During the last few years petroleum, with its most valuable constituent, gasoline, has become one of our most vital resources, so that even the most cheerful optimist might well begin to question the immediate future prospects of the industry; but with thousands of square miles of rock lying above ground, within sight of trunk-line railroads and constituting an unfailing oil reservoir, we can feel assured of a supply of gasoline for many generations to come.

The United States is indeed a country blessed by a generous Providence. Germany, to supplement its stock of petroleum and gasoline, laboriously raises potatoes from which to distil fuel alcohol; but here in America there are mountains of oil rock which can be blasted and steam-shoveled and transported by gravity to great retorts, which will turn out oil and fertilizer in limitless quantities.

The production of oil in this country, instead of decreasing, will continue to grow; it will even, because of the shale resource, greatly increase its present immense output of 340,000,000 barrels a year and will keep pace with the enormously increasing demand. No one may be bold enough to foretell what tremendous figure of production may be reached within the next ten years.

From National Geographic Magazine, Washington, D. C.—Copyright 1918—By Special Permission.

The discovery of this new source of oil will doubtless result in the formation of many "fake" oil companies, organized for the purpose of robbing the public. For this reason our readers are warned against such fraudulent organizations. Anyone who intends investing funds in oil-shale corporations should investigate fully the companies and their promoters. —Ed.

Long Distance Haulage.

A new enterprise has just been inaugurated by the New York and Philadelphia Auto Trucking Company which bids fair to be an excellent business proposition. We speak of the truck service between New York and Philadelphia.

At the present time this company is running a fleet of five-ton Pierce Arrow motor trucks between the two cities mentioned, the trucks leaving at both ends every day, and carrying goods of practically any size, shape and weight. Freight received at any of the truck company's receiving stations before five p. m. is delivered the following day, under ordinary conditions.

Unquestionably such service will be of great value to merchants at both of these cities, who are at present troubled by the existing freight conditions.

How to Place and Distribute Advertising So That It Will Give Results

1—The Reason for Advertising and Its Relation to Successful Business as Contrasted With Dust and Cobwebs in a Side Street Garage

BY FRANK A. FARRINGTON

There used to be considerable debating over the question of whether it pays to advertise but there has ceased to be any such question among well informed business men in any line of business and the question is no longer, "Does it pay to advertise?" but "How can I make it pay?"

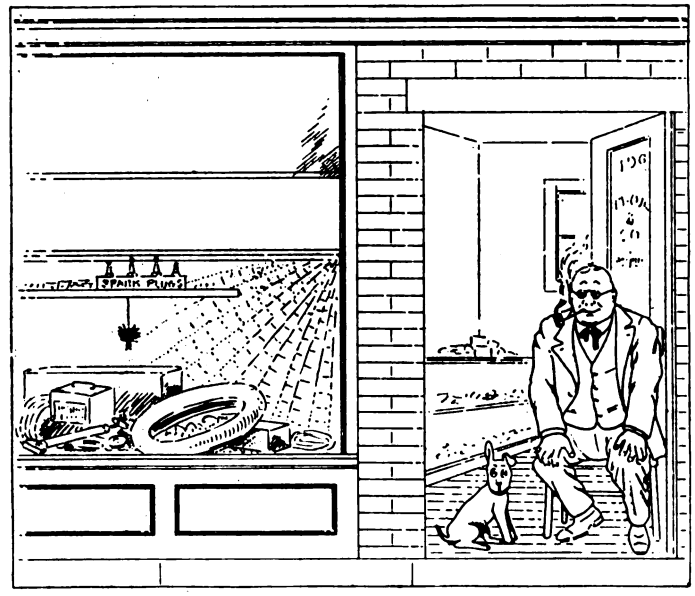
When you find a merchant who does not believe in advertising, you find an old fogy with windows filled with junk, with cobwebs along the tops of the shelves, and it is more than likely you find this man sitting back at a mussy desk in an idle store, kicking about the hard times and lack of trade.

The automobile business, especially the garage business, is comparatively new. Many men have developed garages, without any advertising. We all know of remarkable successes in the garage line, successes not coupled with any appreciable amount of advertising.

Success Without Advertising.

There are two reasons why garages have been largely successful without advertising. One is that the majority of men going into this business have been men totally without merchandising or retail selling experience. Some have been salesmen and have thus drifted into representing certain automobile manufacturers locally. Many have been mechanics who have seen a chance to develop into employers instead of remaining employees. Owing to this condition there has been a large percentage of garage proprietors who did not know how to go about advertising and so they have not tried it themselves and they have not been forced into it by lively advertising on the part of competitors.

The other reason why garages have not advertised largely, is that the demand for garage work and service has increased so rapidly that a great proportion of garages have had no trouble in getting all they could do, most of the year, without having to hustle for the business.



But the man who looks to the past of this business for rules to govern the future will make a fatal mistake if he assumes that advertising is going to remain a negligible factor in the making of success. There begins to be competition in repair work. In some localities too many have opened garages. In other places, capital has financed large garage enterprises with men at the heads of them who know something of the value of advertising. Lack of help may make it possible for shops to run to full capacity during the war, but the war is not going to last forever and the man who succeeds best after the war will be he who begins now to build for that time by giving his business plenty of publicity and extending as much as possible his territory.

In the Accessory Field.

Then, in the accessory field, the situation already has become acute in plenty of places. Accessories are being taken on by stores in the hardware and other fields, stores operated by men who do advertise and who are going to apply to automobile accessories the same advertising methods they have been applying so successfully to other lines.

It amounts to this. If the repair man wants to get the most desirable class of patrons, he will have to advertise, or the advertising garage will get the best class of trade and the non-advertiser will have to take what is left. There may be enough left to keep business good now, but the condition will not last, and anyway, who wants to be the man to get along with what is left over, after the other fellows have taken their choice?

And it amounts to this. The garage owners must

Dust and Spiders Find Good Homes in the Shops of the Men Who Do Not Believe in Advertising.

advertise in the accessory field or the first thing they know, the accessory business will be in the hands of merchants of one class and another.

All this is with refernce to the necessity for advertising. It is saying nothing about the advantage of advertising, even when it is not necessary to the actual life and continuance of the business.

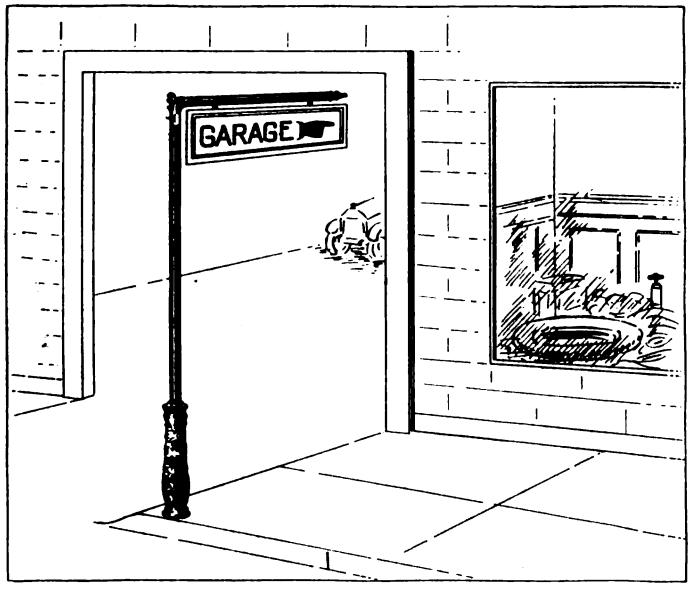
One Should Advertise.

You should advertise, not only to protect your business against the encroachments of others who do advertise, but you should advertise in order to make your business a real success. You may be satisfied as long as you do enough business to make a living. I don't call that being successful. Unless you are able to improve your financial condition materially year by year, you may be getting along but,—you are not succeeding.

You cannot develop your business to anything like its maximum capacity and you cannot come anywhere near taking full advantage of your busi-

Digitized by Google

ness opportunities unless you advertise intelligently and persistently.



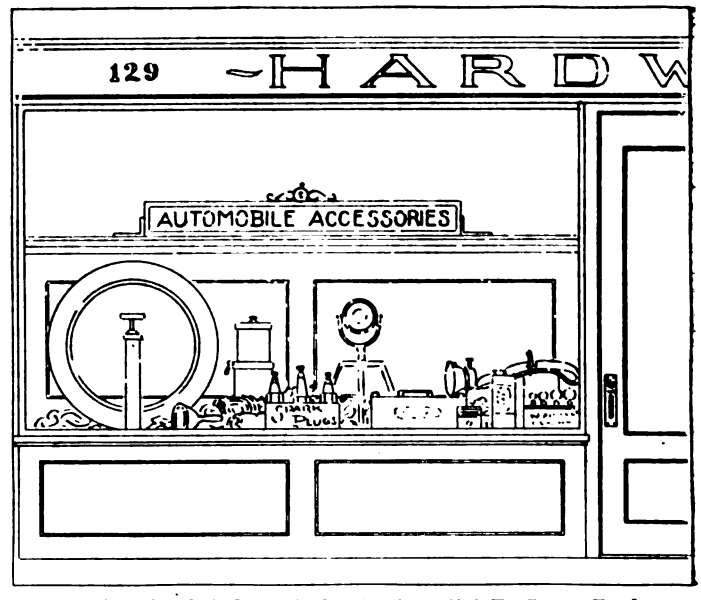
The trouble with doing just enough business to get along comfortably is that as soon as anything happens; sickness, dull times, fire or any of half a dozen business-smashing events; you are up against it. In order to carry on, in spite of reverses, you must have resources. It will take advertising to put your business where it will have enough momentum to take it over the rough spots without coming to a stop.

Obtain Your Share.

If you are going to get your share of the best business in your locality, you must advertise. If you are going to get more than your share and develop a business bigger than some of the others, you must advertise. If you are going to hold your own in the face of competition, that is going to advertise whether you do or not, you must advertise.

It resolves itself into this. If you succeed from now on, without the help of advertising, it will be in spite of that lack, not on account of it. Advertising will produce success when success would otherwise be lacking. Advertising will make of the least success, a success worth while.

So my suggestion is that no more opportunity for growth be wasted by failing to advertise, and that no more time be wasted in considering whether



The Sign in Front of Your Garage Shows That You Believe in Advertising.

or not it is worth while to advertise. Let's make up our minds at once that we can't afford not to advertise and let's begin right away to do something along that line.

Whatever you may say you think about advertising, I know you believe in it because you have put a sign out on the street to call attention to your garage, thereby admitting that you don't trust to everybody knowing you are there without being reminded. And you like to see an announcement in the paper saying that you have sold So-and-so a car, or that you have overhauled Somebody's car. You know that such notices bring your garage to the minds of the public and remind them of your business. You have all along believed in advertising that did not cost anything, whether you have admitted a belief in other advertising or not.

In times when it becomes desirable to reduce operating expenses, the man who is not a very firm believer in the value of advertising and who has advertised just because somebody told him it was

An Attractive Window Display Is Essential To Draw Trade.

the thing to do, generally thinks of his advertising expense as the first one to be eliminated. He does not trace definite business to individual advertisements, so he does not see as his advertising pays. He quits advertising to save money. That is just about the same as to cease feeding a child when it gets hungry. Advertising is not a cause of expense, it is a cause of growth.

Very rarely can a dealer see wherein a single advertisement has brought enough returns to pay its cost. Plenty of men have decided that advertising did not pay because, as they have said, "I tried it once and it didn't bring any business." Occasional advertising will not even bring occasional business.

Progressive Advertising.

How far would you get if you went out on the road with a car and tried to proceed on the plan of starting the motor for three or four revolutions at a time and then stopping it each time. You would use up power enough and it would cost enough to have produced results, but would it get you anywhere? On the other hand, if you turn on the motor and let it run, using the power intelligently, you roll along nicely at less cost than the other way which accomplished nothing.

Advertising is like that. It must be kept going regularly and then its effect is cumulative. That is each succeeding advertisement has a greater influence because of those that have appeared before. Certain medicines are cumulative. Arsenic, for example. The longer you take it, the more it accumulates in your system. Every little bit you take, added to what remains in your system, makes a little bit more. Advertising is like that. The longer you advertise, the more value each advertisement has.

Plenty of men have started in to advertise, having made good resolutions, only to lose faith gradually

Digitized by Google

in the work because they did not get early results. Well, it is not much of a trick to get discouraged and quit. Anybody can be a quitter in advertising as in other things. Advertising is one of those things that calls for "sticktoitiveness," for hanging right on and trying one's very best all the time.

Human Interest Stuff.

I don't care how little you may know about advertising, you can advertise. Some of the best advertisements ever written have been written by men so inexperienced in that sort of thing that they just went ahead and wrote out in a perfectly natural, human way just what they wanted to say to the public, and the public saw it was not merely stuff made up to fill advertising space, but real messages, and they sat up and took notice.

The good advertisement is not the one with the flossiest language or the most sensational headline or the fanciest type arrangement. It is the one that gets its message over to the reader. Good advertising is merely having something to say and saying it so that people will understand it, and feel an interest in it, if it applies to them in any way.

I would not recommend an advertisement so crude as to be ill spelled or grammatically incorrect, because it might create a distrust of the business behind it, but any man, who can put his message on paper without violating rules of spelling or mixing his grammar too badly, can make up advertisements. And the man who doubts his ability to make his ad correct in those particulars, will find that the printer will correct his mistakes if he asks it.

If you positively cannot say on paper what you want to say and say it so people will understand you easily, then you will do well to ask assistance and perhaps even to engage someone to write your advertisements for you, but in any event, advertise!

Be Original.

No one knows as well as you what you have to offer the public in the way of goods or service. No one knows as well what your patrons want. Therefore you should not take to using ready made advertisements supplied from the outside. You may be able to buy advertisements with more rhetorical flourishes than you could give them, but the value of your advertisement lies in its ability to get business. Get up your own copy, even if it is not very good at first. Stick to it, writing and rewriting each advertisement, gaining in experience all the time, studying the advertising of men whom you know are good advertisers and adopting their ideas. You will be a better advertiser each year and your advertising will have the individuality that belongs to it, because it is your own.

One question that many garage proprietors feel unable to answer satisfactorily is how much money to spend in advertising. An off-hand answer made to fit all cases would fit none. Each individual case requires a different answer. Still there are certain things to be said that are applicable to all cases.

How Much to Spend.

The merchant, advertising a store, considers that two per cent of his gross sales is not excessive as an advertising appropriation. That is not a rule that can be applied to garages in just that way. A garage should, I think, plan to use such an amount of advertising as will be effective in producing a gain in business.

If your receipts last year were $20,000 and you feel that you could take care of a $25,000 business this year and that the extra $5,000 is there for you to get, I would suggest that you consider the advisability of spending on advertising a sum equal to the larger portion of the net profit on that increase. The intelligent use of a few hundred dollars in advertising should bring in some thousands of dollars worth of business.

The man who is just starting a garage must use advertising without reference to his receipts, because at the outset, he has no receipts to serve as a basis. He must spend what is necessary to get the business or he must quit. The man with a going business must use as much advertising as will at least maintain a slight growth, because the business that stands still will fail. Put aside for advertising enough money to do creditable advertising. If you use the newspapers, and nothing is better, take space enough to make it look as if your business amounted to something. A shoe repair

The First Week's Advertising Brings But Few Customers; The Long Line of "Regulars" Can Only Be Obtained by Constant Advertising.

Digitized by Google

shop might well enough use a small newspaper space and it would not look out of place, but a garage and automobile business is thought of in a large way and to use a small space in a newspaper, unless it is a metropolitan daily, would have a tendency to make people think your business insignificant.

Advertising Pays.

Within any reasonable limits any sum you spend in good advertising, in judicious advertising, well placed, will repay you for the investment, so you need not worry about its being a loss. Consider each bit of advertising you plan and consider it well to determine whether or not it is worth the cost. If it is a standard kind of advertising, not a freak stunt, you are pretty safe in going ahead with it. If it is something out of the usual run, something in the nature of an experiment, it is probably better to play it safe and leave it alone.

If you do not trust your own judgment in the matter of advertising, go to some successful advertising merchant in your town and ask his advice. Spend more time in planning how to get up good advertising and less in seeking to get out of spending money on advertising. Advertising should be the life of your business and the source of its growth.

COAL HAULAGE BY TRUCKS.

Recent Coal Famine Demonstrates the Need For Coal Trucks Throughout the Country.

BY FELIX J. KOCH.

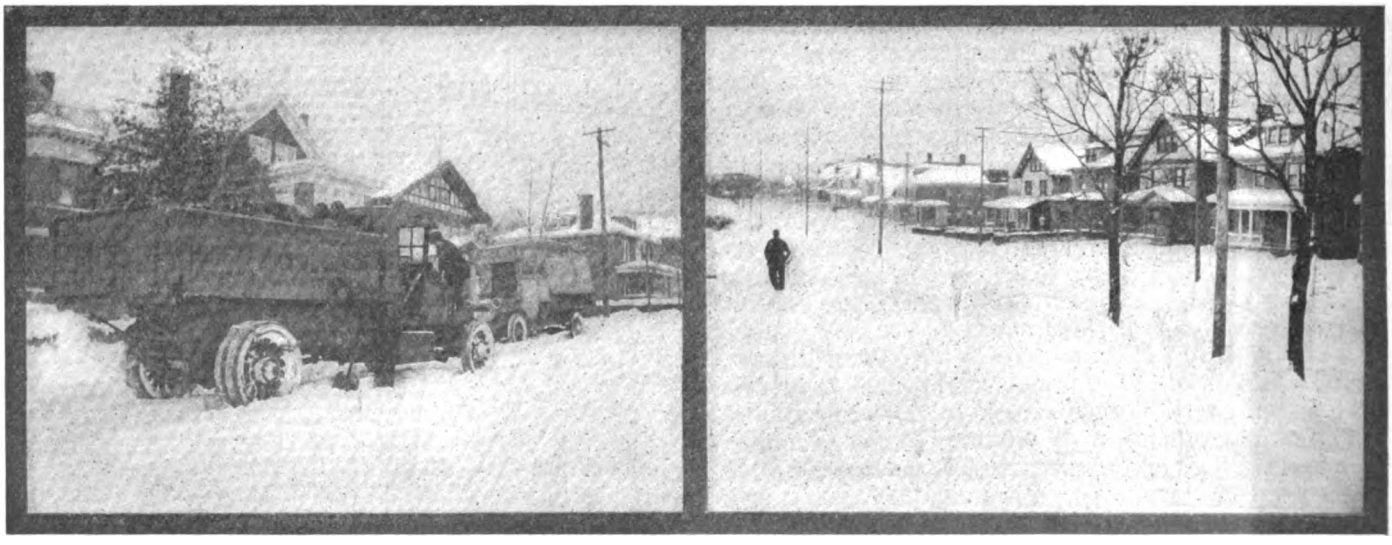
Never in all the history of our big republic have people in the great Mid-West gone through such a winter as that just passed; and, now that Heatless Days and Fuelless Days, and seasons of fastly-diminishing gas-pressure and so on, luckily are over, the victims of a winter without a parallel; but doubly dire, because of war-times; are recounting the lessons brought forth by the calamity, to themselves.

Not the least interesting, as well as valuable, to both auto dealer, who is seeking to convince wavering clients; and to coal-men, who would learn lessons by what has gone before; is the worth of good, reliable, motor-trucks, able to "buck" the snows in times of such exceptional conditions.

In Cincinnati, though situated on the Ohio, and a reputed artery for the coal-fleets from the mines, coal might be found occasionally in the yards. Quite a bit of coal was actually reported at Silver Grove, Ky.; just a few miles outside the 'cross-the-river town, but teams couldn't haul over the glazed streets and through the growing snow drifts; nor could private autos, impanelled to such unwonted purpose, get about.

One Concern Prepared.

One great concern, fortunate in having the coal, did make its deliveries almost without fail, and this was because, in proper season, it had equipped itself with suitable motor-trucks.



"Our company," its managers told us, "have at their command two trucks of one type, and two other types of machines, which, for a concern of our size proves adequate.

"During the exceptional cold and snow I'll admit that very occasionally the heavy coal-trucks did have a pretty hard time of it, getting through the snow-banks on the steep hills here, as best they could. When stuck, however, the men would throw bits of coal under the wheels, and with this and, of course, the use of chains, they did manage to keep going. What was more, their every trip represented a movement of from five to five tons and a half of coal.

"Had we had horse-drawn coal wagons, as of old, it is doubtful if the horses could have made the slippery hills, or kept from stumbling in the snows. They would have had to rest, again and again, and with that, each full load would have meant but a ton and a half of coal."

One of the pictures serves to give an idea of the conditions of the streets, through which the coal-trucks were forced to traverse; and one of the photos shows what, at moment, proved a sight for folk to rush to see—an auto-truck, coal-laden, actually in progress there.

This is but one instance out of many, for all over the country the motor truck was utilized for carting coal and food for the suffering people. Doubtless the merchants and store men in the various small towns of the country have profited by this winter's experiences and realize the great value of motor trucks in their business, which, in many cases, would not have continued had it not been for this useful machine.

During the Recent Coal Shortage Motor Trucks Were the Only Possible Means of Transportation in This Town Where the Snow, in Places, Reached to the Piazza Floors.

Repainting the Car for the Summer Season

How to Clean Off the Old Paint and Varnish and Put On a New "Dress" Which Will Last Throughout the Year

BY JAMES F. HOBART, M. E.

About this season every year a great many automobile owners get into trouble through the idea that they can save a bunch of money by painting and varnishing their own car. If, however, a man desires to learn something about these matters, he sure can do so, if he profits by his mistakes, finds out why he was wrong, and then looks out for it next time. That's experience, and the experienced

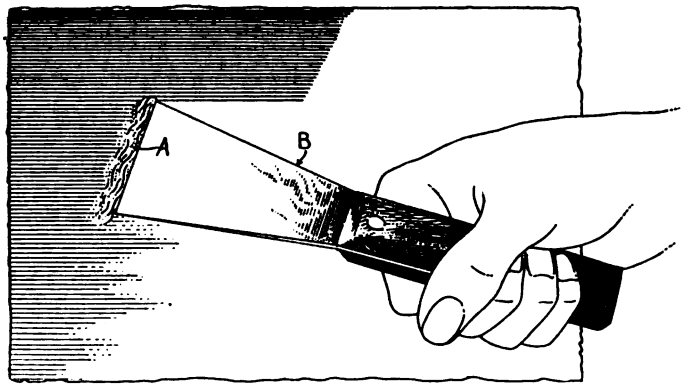

Fig. 1.—A Putty Knife May Be Used to Remove Softened Paint.

man can paint a car as well as a painter, provided his experience is equal to that possessed by the "Knight of the Brush."

Prepare the Surface.

The right way to paint a car is to get the surface good and ready before you start painting. You can't do a good job unless the surface is made just right, before the paint and varnish are applied. You can't do a good job of painting over an old coat, and you can't do a first-class job of varnishing over a cracked or lumpy surface of old paint. The old coats MUST COME OFF, if you want a first-class job—there is no "if or and" about it—the old coats of varnish and paint MUST be removed and the surfaces made smooth and clean before applying the new coats of pigment.

The removing of old paint and varnish from the surface of an automobile, is no joke, as anybody knows, who has tried it once or twice. If the car only needs revarnishing, it is a comparatively easy matter to take off the old coat of varnish, for the application of strong water of ammonia, allowing it to remain on the paint for one-half to three-quarters of an hour, will so decompose and loosen the varnish, that it may be scraped off in the form of jelly as at A, with a putty-knife, B, or a scraper, as shown in Fig. 1. If it don't all come off clean at first, paint on more ammonia, and scrape it again in a short time.

Removing the Paint.

In the removing of the paint is where the "rub" comes, and where the "scrape" comes too. From the wooden parts, and from the thin metal portions of the car the paint may be removed sometimes by means of a gasoline blow torch, Fig. 2 at A; the paint being softened by the hot blast as at B, and removed quite easily with the same scraper used for taking off the varnish.

The removal of the old paint from the solid metal portions of the machine is where trouble comes aboard. Sometimes it is utterly impossible to remove the paint without chipping it off, and that's a mighty good way of doing it. A sharp chisel, A, Fig. 3, and a light mallet, B, and off the old paint comes, bit by bit, as at C, until the whole surface has been gone over—and when it's done, you will wonder how the manufacturer put so much surface area into one little old automobile! When there is a good supply of compressed air, as there should be in every garage, obtain a little pneumatic hammer, and you can remove the old paint in a hurry. There's nothing like a pneumatic hammer for removing old paint, and every automobile painter should equip his shop with such an outfit.

I don't intend to take space for telling how to paint an automobile, or what paint to use, save to say that the thinner the coats, the more of them, and the better the sanding and rubbing down between coats, the better will be the resulting job. Be sure to allow plenty of time between coats of paint. You can't get first-class results with a heavy coat of paint or enamel placed on top of another green or

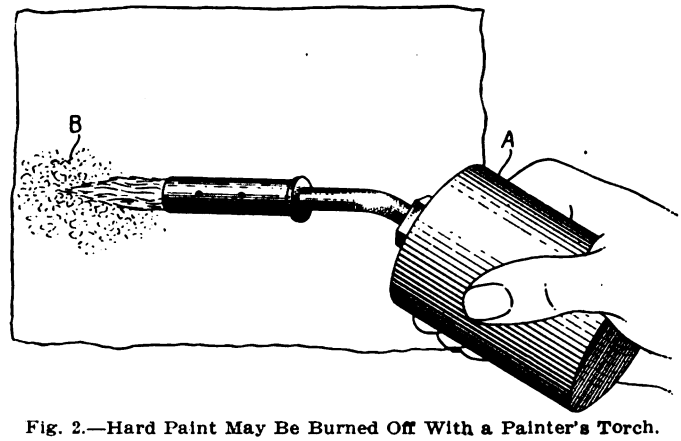

Fig. 2.—Hard Paint May Be Burned Off With a Painter's Torch.

undried coat. It is useless to expect satisfactory results from that way of painting, therefore, don't try it.

It's the varnishing which we will consider mostly this time, and I intend to tell of some of the troubles I have been up against, and which I have seen others encounter when doing their own painting and varnishing. Painting is an important part of work, just as the cleaning off of the old coats of paint is something upon which the quality of the varnishing depends largely.

Cause of Milky Appearance.

When the experienced varnisher calls your work a "Blooming" bad job, he means that the "blooming" is a misty appearance of the surface which was probably caused by the dampness of the room in

Digitized by Google

which the varnishing was done, or in which the car was kept. Sometimes this trouble appears a long time after the varnishing is finished. Sometimes the appearance may be remedied by drying out the work thoroughly and then going over the surface with a good polish made of linseed oil and varnish, mixed together, rubbing the surface the same as in French polishing. This MAY remedy the trouble, but sometimes it won't satisfactorily.

When the finishing coat loses its gloss and becomes "dead" it may be caused by improper filling, if upon a wooden surface; or because the under coats were not fully dried before the outer ones were applied. The only remedy for "Flattening" is to rub down the surface and give the work another finishing coat of varnish.

Another very frequent and very bad defect in amateur work is "cracking." This is usually caused by too heavy undercoats, or by putting on a follow coat before the previous coat is ready for it. Cracking must not be confused with "checking." The former is a lot of coarse cracks, the latter a network of very fine ones, which are caused usually by sudden cold blasts of air upon the varnished surface. A blast of cold air in the varnishing room may do it. Or, you may check an otherwise fine job of varnishing by the use of too hot water while washing the surface of the varnish. There is another cause of checking, which sometimes occurs, and that is, revarnishing the car with a hard, brittle varnish—"short-oil" varnish, as it is called, applied over a coat of elastic varnish. This causes the outer coat to become "hide-bound" and crack open in many fine lines, as the under elastic coat of varnish expands. Checking, as well as cracking, can be cured only by removing the defective coats, right down to the seat of the trouble, and then varnishing anew.

Cause of Furrowing.

Sometimes the varnished surface presents a peculiar appearance, as though the varnish had run

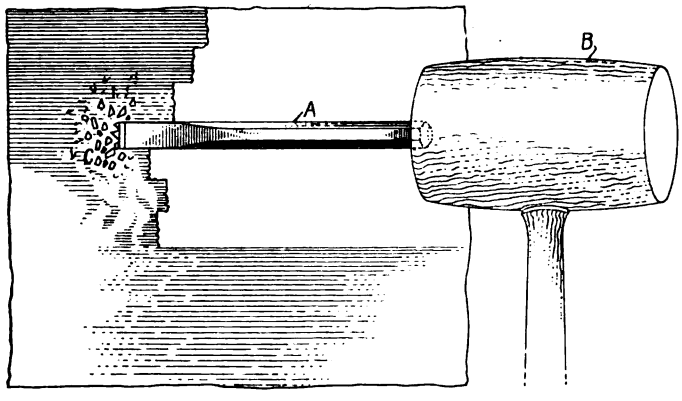

Fig. 3.—Exceptionally Hard or Brittle Finish May Be Chipped Off with a Cold Chisel.

down in little furrows, frequently presenting the appearance of field freshly plowed with very light even furrows. For this reason this defect in varnish is called "furrowing" and is often caused by too much change in the temperature of the varnish room while the work is drying. Or, it may be caused by a heavy draft striking the work during the drying period. Sometimes this defect—also called "crawling"—is caused by placing a varnish coat upon a cold surface, or over one which has not dried sufficiently. If the defects appear in little patches instead of in furrows or lines, it is known as "pitting," and the little pock-marks are caused by the same things that cause crawling or furrowing. The remedy is, of course, the same, and that is, keep the work warm and at an even temperature while varnishing and while drying. Here the "dry-house" method of varnishing comes in remarkably well.

"Specking" is one of the most frequent troubles met with in cold weather. It may be due to several causes—by a dirty foundation for the varnish, because the paint coats are not clean and free from dust, or because the brush or the varnish container is not clean. Then there is "can specking," so-called, due to the varnish having been kept in too cool a place. The oil in the varnish having partially congealed or frozen, appears as little lumps or specks in the varnish. The remedy is a very simple one indeed—just keep the varnish can where it will be warm and not subject to changes of temperature as it would be in a room kept warm during the day and allowed to become cold at night. Keep the work, the brush, and the varnish can clean, the room at an even temperature, day and night, and you will have no trouble from "specking." Dust in the varnish room is one great cause of specking and may be added to the causes noted above.

Sometimes the varnished surface presents a queer appearance, as though it might have been applied to an uneven surface like that of bread dough. Ask an experienced varnisher what the trouble is, and he will tell you that it is "sagging," or "wrinkling," and if you can get him to tell you the cause of the trouble, you will find that it is due to applying the varnish in too heavy or in uneven coats—mighty little reason, the novice may think, but it is enough to cause a whole lot of trouble, and one which can seldom be cured, except by removing the varnish coats and starting all over again upon a clean paint surface.

There are some other troubles which the beginner in varnishing will probably encounter, and doubtless one of these will be the peeling off of portions of the varnished surface, possibly soon after the job has been completed, though it may also take place a long time after the work has been done.

Cure for Flaking.

When a section of the varnish peels off slick and clean and comes at the bare touch of the fingers, the trouble is called "flaking," a very bad trouble it is too, and one which is hard to remedy, for it often calls for the removal of the entire varnish work and the revarnishing through all the coats, from the paint up to the finishing coat.

It is very hard indeed, sometimes impossible, to remove and repair a flaked spot and have the new work match the old. Indeed, when this is done, it is almost always necessary to remove the varnish from the entire surface—be it side, end or top, of the affected piece. The other sides can be left as they were, and the joining of the new and old work made on the edges or corners, where the seam will not show, as it might if the joining were done in the middle of a large flat surface.

Sometimes "sweating" may be cured by rubbing with a rag dipped in a mixture of shellac and linseed oil. This action is really "French-polishing" the sweated portion, but this will not always remove the disfiguration, and it is necessary to re-rub the sweated surface, then refinish with a hard drying

Digitized by Google

varnish which will not sweat. But there are cases where this method will not answer. It may be possible that a varnish was used which never will dry hard. There are such; all "elastic" varnishes belong to that class, and in such cases it will be necessary to refinish the surface with a varnish which will dry hard. In cases of this kind the old and soft varnish should be rubbed to a dull surface before the new finishing coat is applied.

Kind of Paint to Use.

In regard to the kind of paint and varnish which should best be used upon automobiles, I shall leave that matter entirely to the fancy of the automobile owner, the conscience of the paint and varnish dealer, and to the section of country in which the painting business may be located. It makes just a bit of difference whether the varnishing is to be done and used in Alberta, or in Mexico, as some autoists have found, when they finish a car in a cold country and tour in a hot one. To be sure, this stunt in the paint and varnish line can be successfully carried out, but it must be looked after before the painting and varnishing is done—not afterward!

A good many automobiles are enamelled, instead of being "hand-painted" and varnished. And if the enamel is good to begin with, and properly applied, it seems to the writer to be far preferable to the old-time paint and varnish. The enamel wears well, and, being solid and uniform from top to bottom, it wears long, and when damaged by abrasion or rubbing it sems to show the defects much less than does paint and varnish.

Don't Mix Your Own Paint.

Should you decide to use paint and varnish, do not try to mix the paint yourself. There are so many good ready-mixed paints on the market now that it doesn't pay to try and mix them by hand. Furthermore, you can't—nobody can—mix paints by hand as well as they can be mixed by machine. The most thorough stirring with paddle and stick can never mix the pigment and oils as well as passing them through a paint-mill, where they are ground intimately together. Not a particle of the pigment escapes the grinding and mixing machine. Therefore, use ready-mixed paints put out by some reputable maker, and you will obtain better and more lasting results than is possible with paints mixed by hand.

Hand-Mixing Paint.

Once in a while, in some parts of the country, it may be necessary to mix a lot of paint by hand, all the ready-mixed paints on sale to the contrary. Sometimes the dealer "Keeps it, but is out just now," and one has to use what he can get. Therefore, if it comes right down to a "white lead and oil" proposition, it will pay to go about the paint preparation in a certain way—not to throw the ingredients together haphazardly.

First, see that the white lead is soft and free from lumps. If the cover is left off the keg, the surface oxidizes and there may be dirt in the lead oxide. Be sure to get all of this out before mixing the paint. Some men mix it, dirt and all, and then strain the paint afterwards. But it is a better plan to clean the lead before mixing in the colors and the dryer. To do this, separate all the lumps from the clean oxide, and with a little oil, or if that fails a bit of turpentine, rub up the lumps. The oil will dissolve the good paint, leave the dirt, and enable one to separate the good from the bad.

A piece of thin, strong cloth will do nicely. Spread the cloth over a can, pour in the paint, fold the cloth and squeeze the good paint through, leaving the dirt and hard lumps behind. The liquid portion may be returned to the cloth as many times as necessary, until the oxide has been well cleaned. I have used dried white lead which had to be broken into lumps with a mallet before it could be put into the squeeze-

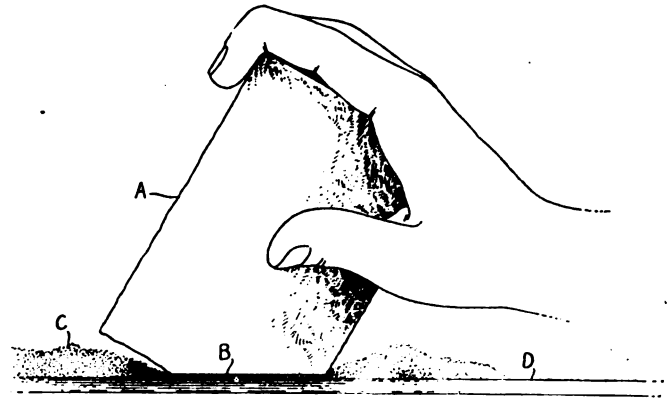

Fig. 4.—Dry Paint May Be Ground Upon a Glass or Marble Surface With a Flattened Brick.

cloth, but one should not use such stuff if one can get better, for it takes too much time and patience.

Paint Mixtures.

I like to mix about one-third zinc oxide with the lead oxide, for it seems to stand the weather longer and gives a better surface than lead alone. If the zinc oxide is ground in oil, handle it exactly the same as you did the white lead, but if the zinc is dry (in powder form), then there is more hard work to be done, which entails the mixing of the zinc oxide with some oil. To do this I prefer to moisten the dry zinc first with a little turpentine, then work in some boiled linseed oil. To do this I use a flat palette knife, placing the zinc and oil on a big pane of glass, and grinding the zinc thereupon with the flat of the knife.

Sometimes it will be found necessary to grind the oxide more than can be done with the knife. When this is necessary, obtain a smooth cobble stone, A, Fig. 4, about as big as a large cocoanut, and chip off one end, B, leaving a flat place about 3x4 inches if possible. Smooth up the flat place on an emery wheel, and make it fit the glass as much as possible. Then you can grind the paint C between the glass D and the stone A, as well as it can be done in a paint-mill, but very much more slowly, of course.

After the turps, the dryer and the colors have been added to the oil, lead and zinc, grind them well with the stone "muller" upon the glass, and you will have some good paint.

Tractor Demonstration.

An educational tractor demonstration will be held under the supervision of the Society of American Agricultural Engineers by the California Tractor & Implement Association at Davis, Calif., on April 17th, 18th, and 19th. This demonstration is to be more in the nature of a test and a great number of tractors will be entered. Each tractor is to be given a practical try-out in plowing, harrowing and other work.

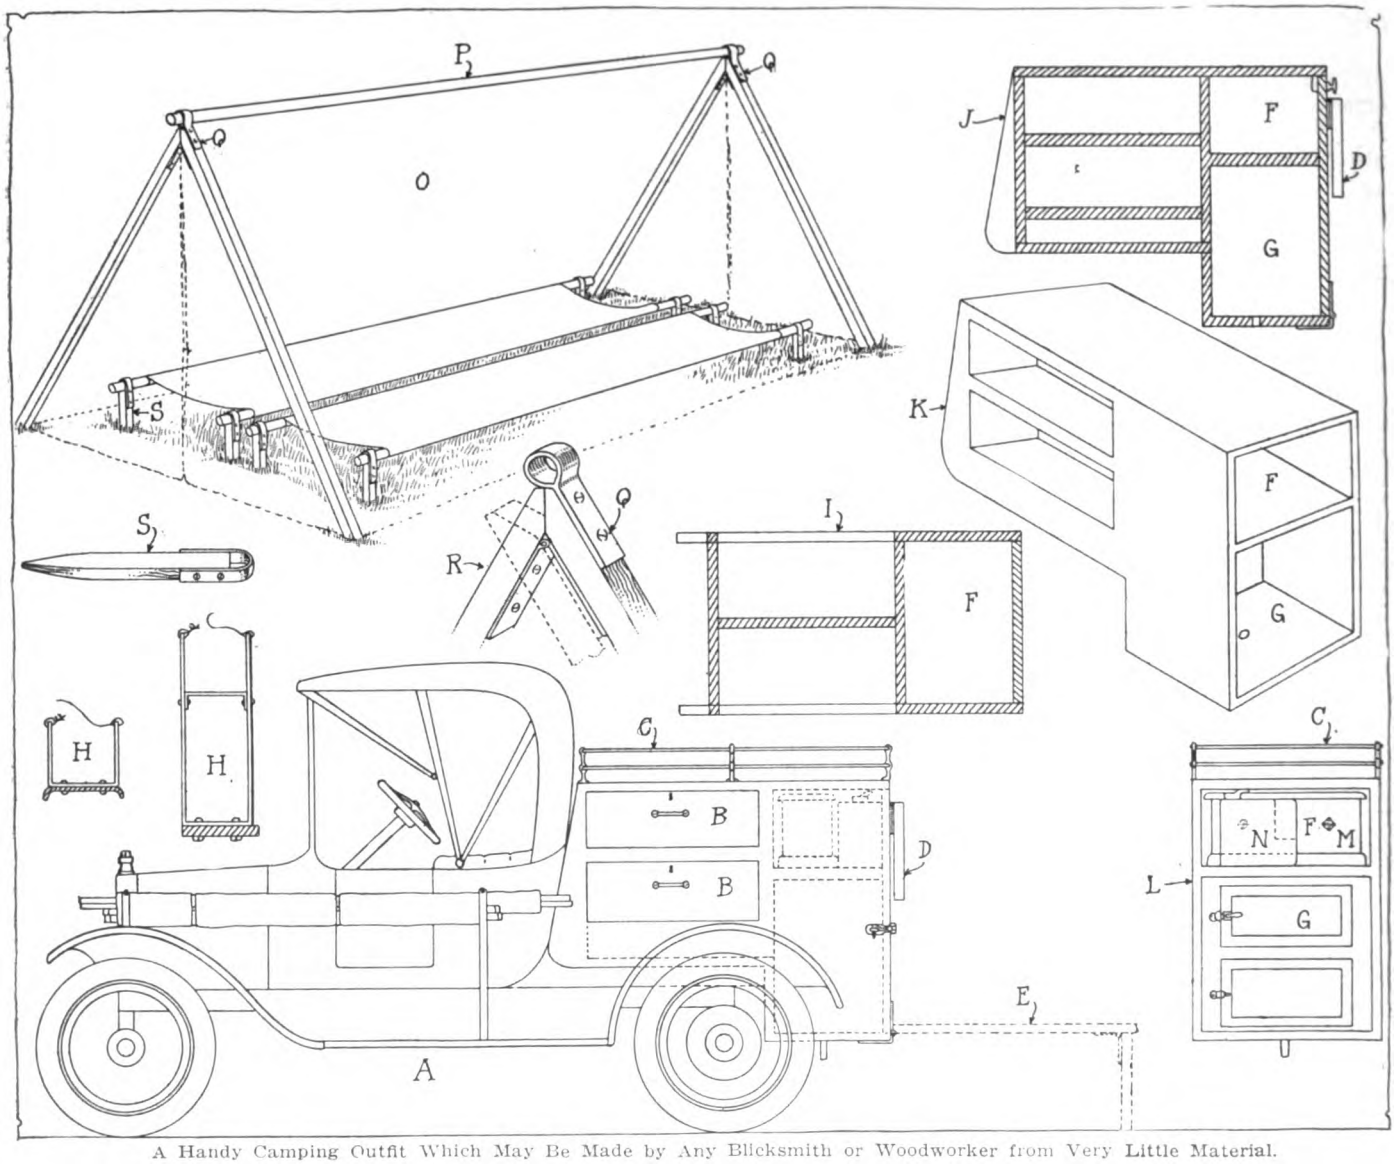
Suggested Ford Car Body Design for Carrying Hunting or Fishing Outfit

A Compact Camping Outfit For the Car Owner Who Prefers to Enjoy His Vacation Close to Nature in the Open Air

That "grand and glorious feeling" which is often termed "Spring Fever," just about this time begins to attack every person who likes an outdoors life. Doubtless every nature lover, at some time during the past hard winter, has looked with longing at his picture collection and talked over with his friends the big fight which he had last summer with a particularly big trout.



If he has been fortunate and a good hunter, he may have the head and antlers of a proud stag in his den at home, to bring back the thrill of the chase.

Perhaps he is neither a hunter or a fisherman, but simply likes to be out of doors where he can breathe the fresh air, untainted by the dust and smoke of city or town streets.

In any event, if he owns an automobile, now is the time that he longs to ride, and ride, and ride, forgetting his office for the time being and climb the hills into the country.

The average autoist does not care to be hampered in his longer trips, or when he is fishing and hunting, by the feeling that he must depend upon a hotel for meals and shelter. He usually prefers to carry along, in his car, a tent and a few blankets so that he can camp wherever his fancy dictates, and so we have designed this camping body, particularly for the Ford car, but applicable to practically any type of roadster.

This body may be constructed by practically any man handy with tools, and from "odds and ends" of lumber which may be picked up at any carpenter shop. It has been designed in such a manner that little or no joining work is necessary. The largest

A Handy Camping Outfit Which May Be Made by Any Blicksmith or Woodworker from Very Little Material.

Digitized by Google

pieces of stock are required for the sides, which are made of one piece, to obviate the need of fine joining; while the balance of the body may be made from short lengths of pine or other cheap stock.

When complete, as shown at A, the whole design harmonizes with the general lines of the car body, and presents a neat and attractive appearance, much preferable to a pile of bedding, tents, tinware, etc., such as might be required in a camping outfit.

At the front end, the body measures two feet, seven inches in height with a "hang-over" back which drops below the chassis frame, and measures, over all, three feet, seven inches. The total width is two feet, seven inches, and the length four feet, four inches. The body may be bolted to the flooring of the car, or to the chassis frame as desired.

Four large drawers, two in each side, as shown at B, B, are the main compartments and serve to carry the smaller bedding materials, bathing suits, articles of clothing, etc. One of the drawers should be reserved for cooking utensils and divided by partitions for smaller articles such as knives, forks and spoons. When the lower drawers are removed, there is a space beneath, in which may be packed large flat pans or similar articles.

The rear of the body is divided into two large compartments, F and G, by a horizontal shelf; the upper arranged to contain a small, two-burner oil stove and a can of oil; the lower containing a small ice chest. A hole should be cut through the bottom of the lower compartment to permit the escape of water from the melted ice.

Hinged at the lower part of the rear is a large door, E, which is fitted with two folding legs, D. When this door is let down and the legs extended, as shown in the dotted lines, a convenient table is had.

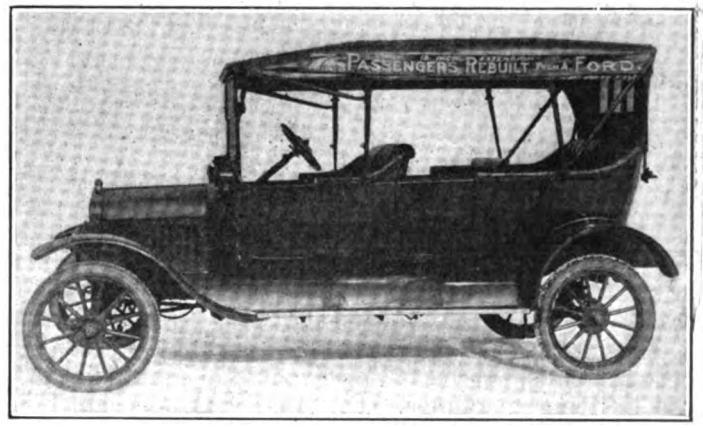
Surrounding the top of the body is an ornamental railing C, which serves to keep articles placed on the top from rolling off, and to which may be fastened tents, bedding, etc., covered with a rubber blanket which is tied to the railing.

To serve as tent pole carriers, a bracket is mounted on the front fender and a post-bracket on the running board. Straps at the tops of the brackets, shown in detail at H, H, serve to hold the contents in place. The brackets are made from strap iron, 1¼ inches wide by ½ inch thick, and are heavy enough to carry the tent poles, two ordinary pole-cot beds, rolled up, and a long-handled net, or fishpole.

The body may be made of 1½-inch panel boards throughout. View I shows a sectional plan, while a side view appears as at J. View K shows the body with the drawers and door removed. View L shows the rear with the door removed, exposing the ice chest in compartment G, the stove at M, and the oil can at N. The tent and bed arrangement is shown at O.

The top tent pole, P, is two inches square and eight feet long and is held in position by the two loop brackets, Q, Q, which in turn are fastened to the tent legs as shown. The four tent legs are six feet, three inches, by 1½ by one inches and hinged at the center so they can be folded together when not in use, as shown in sketch R, indicated by the dotted lines.

In setting up the tent, the pole, P, is held securely in the brackets, Q, by a small wedge shaped piece of wood, then the canvas is stretched over the entire frame and pegged in the ordinary manner, making a strong, simple, but complete tent.



An ingenious method has been devised for holding the beds. The pegs, S, are two feet long and 1½ inches square and pointed at one end. At the top is a short piece of strap iron bent to form a loop for the end of the bed pole. When the stakes are driven into ordinary ground they are sufficient to hold the heaviest person and prevent the annoying swinging together of the bed poles, so common with the "stretcher" type of bed.

In designing this outfit the greatest care has been observed in making the whole construction simple. At the same time, however, there has been no sacrifice of utility, and the outfit should be of great value. It should be ideal for the owner who might not care to put out much money on camping equipment.

A Seven Passenger Ford.

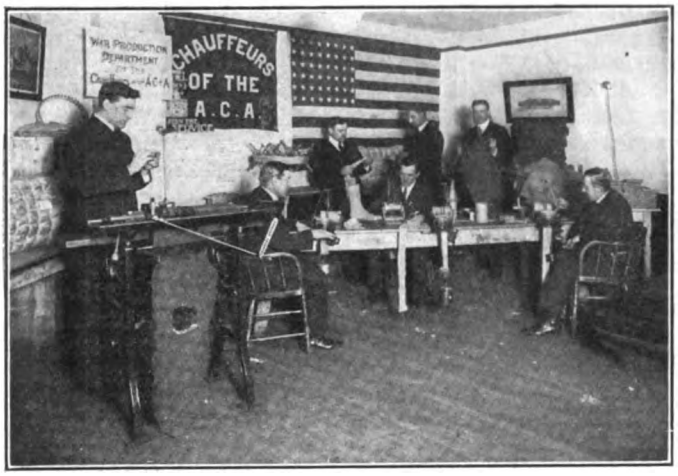
A concern called the McIntyre Motor Trucks Company, having a factory at 100 West 55th Street, Chicago, Ill., has been organized to build a conversion unit whereby the standard Ford touring body may be lengthened sufficiently so as to allow the insertion of two more seats in the tonneau. Such is the construction that from outside appearances, one can hardly determine the point at which the standard body has been altered.

In lengthening out the machine the rear axle con-

How the Ford Looks After It Has Been Extended 18 Inches.

struction including the regular propeller shaft and universal joint is moved backward 18 inches. The frame is lengthened by the addition of two side members which are hot rivetted to the stock members and telescoped in them, in such a way as to give maximum strength and rigidity. Between the old universal joint and the gear-set is interposed a short length of shaft fitted with suitable male and female connections and surrounded by a casing which is flanged on both ends to fit the gear set and the present ball and socket section. The short length housing is rigidly fastened at its rear end to a cross member.

The most radical change is made in the body itself, which is cut down directly in back of the rear door through the sills in such a manner that the back seat is drawn backward approximately eighteen inches. The old rear doors are left in their regular places and between them and the back is fitted an extension piece which does not alter the contour of the body to any appreciable extent. This extension piece is covered at the top with imitation leather to match the seats. The top also is length-



Digitized by Google

ened slightly, a new top being supplied with the equipment which fits the present bows. Where a one-man top is used, as shown in the illustration, an extra price is made, for in this case a full new top is necessary.

The manufacturers claim that with the increase in the body length an easier riding car is had and that the present objection due to the stiffness of the Ford body is entirely removed.

Chauffeurs Do Knitting.

The chauffeurs of the Automobile Club of America have established a Red Cross workroom in their clubroom in New York City, where they operate sweater and sock-knitting machines. They have formed themselves into an auxiliary of the New York County Chapter of the Red Cross. Wool for their work has been donated by the Colony Club and since their first sock machine was given to them on December 4, they have turned out over 1,000 pairs.

War Production Department of the Chauffeurs of the A. C. A.

The men, who have to work at odd moments, between calls, are becoming experts in manipulating the knitting machines. One man has so perfected his work that he can finish a sock every four minutes. Still another can turn out a sweater in fourteen minutes. Men work in relays. When one leaves off another takes up the job.

Twenty-five chauffeurs in the last three months have become expert in the operation of machines. They received their first sweater machine December 18 and since then 200 sweaters have been completed.

Automobile Drivers Needed.

Mr. W. O. Wilson, Secretary of Motor Transportation for the National War Work Council of the Y. M. C. A., 124 East 28th Street, New York City, has just returned from France to recruit in the United States what our French allies call "Gentlemen Drivers." In other words, Mr. Wilson appeals particularly to the well-to-do business man who owns and drives his own automobile. There is work for him to do overseas, and it is hoped that seventy-five men of this calibre will be ready to sail very shortly. It has been planned for about fifty men to sail in April and as many more in June if possible.

These drivers will not be required to do repair work, although the exigencies of a situation in the battle areas may make them more valuable if they can do a bit of necessary repairing now and then while on the road. Any man of fifty years who is in good physical condition can qualify for this service. He will carry supplies which are not otherwise handled by the Quartermaster's Department from the Division Headquarters of the various Y. M. C. A. huts in the lines.

Marking Requirements.

The various express companies operating in the United States and Canada, through the Express Traffic Association, 61 Broadway, New York City, have issued their supplement No. 5 to official express classification No. 25 which deals with the marking requirements, on various commodities passing through their service. An extract covering the requirements relative to automobiles is given herewith.

†**Marking Requirements:**

(a.) Each package, bundle or loose piece in a shipment must be plainly, legibly and durably marked, showing the name of only one consignee, and of only one station, town or city and state to which destined.

(b.) Shipments wrapped in paper, or packed in boxes, crates, barrels, corrugated paper or fiberboard containers must be marked with pen, brush, stencil, waterproof crayon, or by label securely attached with glue or equally good adhesive. Such shipments must not be accepted when marked only with tag except as provided below:

Shipments of iced goods, such as fish, oysters, etc., must be marked with brush, stencil or waterproof crayon, or with two tags securely tacked, one of which must be sunk in a groove in the box or case, or otherwise protected in such manner as to prevent becoming detached or defaced by contact with other articles or surfaces.

Containers which are customarily used several times for transportation of goods by express, such as bread boxes or dog kennels, which cannot be satisfactorily marked with brush, stencil, waterproof crayon or label, may be accepted when bearing two address tags securely attached to the package.

(c.) **Castings, Machine Parts, Shafting, Pipe, Rods, Bars and Other Metal Articles:**

1. When boxed, barreled, crated or trussed, must be marked in compliance with paragraph "(b.)"

2. When not boxed, barreled, crated or trussed, and there is sufficent smooth surface for the purpose, the address must be plainly marked on the article with durable paint. Such shipments must not be accepted unless marks are thoroughly dry.

3. When not boxed, barreled, crated or trussed, or when not possible to mark as provided in preceding paragraph, shipments must be marked with not less than two wooden, leather, metal, cloth, rope stock or sulphite fiber-tag-board tags. Rope stock or sulphite fiber-tag-board tags must test not less than 14 point, 50 per cent. rope, have reinforced metal eyelets and must be attached by wire not less than 23 gauge, or strong tarred cord. Tags must be attached wherever possible to unexposed parts of the article in order that they may not become detached in handling.

4. Rods, Shafting, Bars, Pipe, Iron Bed Sides, Automobile Springs and other articles of like character marked with tags as provided in paragraph "3" must have the tags securely wired to the article, and in addition, a concealed tag bearing the same address, must be bound to the article with burlap covering, the latter securely wired at each end.

(e.) **Automobile Tires.**—When not boxed or crated must have two marks, both to be attached to the inner surface of the package, bale or tire, and to consist (1) of a strong tag securely attached, and (2) another tag bearing the same address, securely bound by burlap or cloth, or an address label pasted on the inner surface.

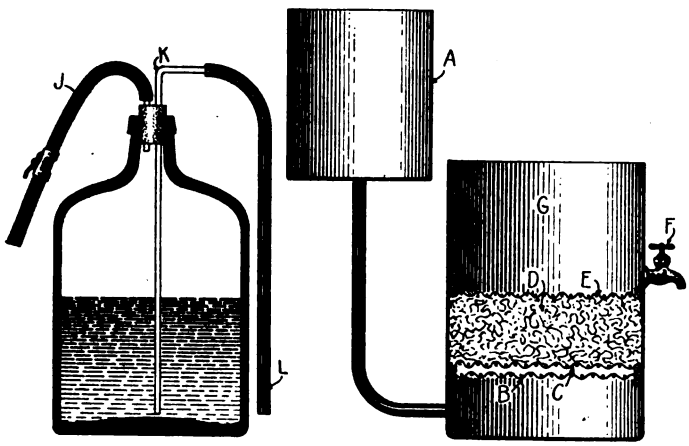
Two Handy Devices for the Garage



A Distilled Water Container and An Oil Filtering Arrangement which Should Be of Interest to the Repair Man

The writer quite recently had the good fortune to go through a large service station where everything was arranged so as to obtain a higher efficiency, and there were two devices which appeared to him to be about as practical as anything in the garage.

The first of these was used for the distilled water supply for storage batteries, and the method used for keeping this supply clean was in great contrast to that of some garages where the battery water is kept in dirty bottles or tin cans, without due regard for cleanliness.

The garage owner had obtained a large rubber cork from a mechanical supply house and through the cork had punched two holes, into which he had inserted two lengths of glass tubing. One of the tubes was just long enough to pass through the cork and was fitted with a length of rubber tubing about three inches long. Clamped over this piece of tubing was a shut-off device which squeezed the tubing tight and prevented the entrance of air. The other piece of glass extended to the bottom of the water jar, and at the upper end was bent over at right angles. This was also fitted with a length of tubing which, however, was long enough to drop down the side of the bottle nearly to the bottom.

In our illustration, H shows the water bottle, J the first length of tubing, K the outlet, and L the long rubber tube. When the filtered water was

A Handy Distilled Water Container at Left, and a Practical Oil Filter at Right.

received from the supply house the rubber cork and all the fittings were removed from the old empty bottle and placed in the new. A slight amount of air pressure upon the tube J with the clamp open started the water through the outlet tube L, which thereafter became a siphon.

When a battery was to be filled, or distilled water sold to an autoist, the clamp on the vent J was loosened and the receptacle placed beneath L. In this way the filtered water would always be kept clean, and there was no necessity for transferring it from the large container to smaller containers for use with hydrometer filler. The idea was particularly good for the very reason that there was absolutely no chance for dust or foreign matter to get into the filtered water, and the water was kept as clean as when distilled.

Oil Filter.

The second device, which was interesting, was designed for the filtration of lubricating oil and was an indication of the efficiency of the management of the garage. As every reader knows, practically all of the automobile manufacturers advise the changing of lubricant in the engine every four or five hundred miles. This advice is good, because present-day fuels have a tendency to get into the lubricating oil and work into the engine base, thereby destroying the efficiency of an oil.

The garage owner did not like to see all of this oil wasted and so installed the apparatus which is illustrated. The device consisted of two large cans connected by a length of one-quarter-inch brass piping. The piping was fastened to the bottom of the can A and to the lower side of the can G. At B in the lower can a circle of fine brass mesh screening was held in place by a circular ridge which was soldered into the can. About half an inch above this was a second finer screen, shown at C. A medium mesh screening was placed at E and the space between E and C was filled with a mixture of cotton waste and steel wool. As the oil was filtered by gravity pressure, it escaped into the upper reservoir at G and could be drawn off from time to time through the spigot F. The writer thought that the principle of the filter was well worked out, for all of the heavier particles of carbon or dirt would settle in the lower part of the can, beneath the screens, and would not clog up the screens, as it might if the oil were to filter down through as an ordinary oil filter.

The idea of using a mixture of steel wool and cotton waste was particularly good because the cotton waste if used alone would have matted down very quickly and prevented the passage of the oil, whereas in this case the steel wool kept the cotton waste well open. All of the screening and the waste compartment were so arranged as to be removable. Practically the only screening that did not rest upon the soldered ring containers was the top one. This was fitted so as to slip beneath the upper ring and was held into place by projecting lugs. Of course the garage man did not use the filtered oil for automobile engines, since the lubricating properties had been, to a certain extent, destroyed. This oil he found of great value around his machine shop for lathe-turning and screw-cutting machines and for lubricating slow-moving machinery parts.

Either of these devices might be made by the average mechanic and are applicable to small garage usage as well as to larger shops. An oil filtering device along these lines, but considerably smaller, might be made by a small garage owner and the filtered oil used for lubricating such parts of the automobile chassis as do not require a high grade of lubricant.

The A B C of the Storage Battery

1—Telling What a Storage Battery Is, Its Internal and External Construction and Its Action During Charge and Discharge

BY A. P. PALMER, E. E.

A battery consists of a number of cells arranged together with their terminals connected so as to give a combined electrical discharge greater than could be obtained with one cell. A cell is the unit in a battery and consists of one or more positive and negative plates or electrodes suspended in a solution or electrolyte so that when their terminals are

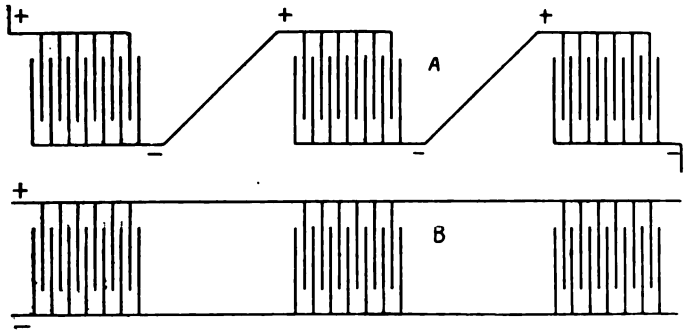

Fig. 1.—Cells Arranged in Series at A, and in Parallel at B.

connected an electrical circuit is made. The electrode out of which current flows into the external circuit is called the positive. The other electrode is the negative.

When the terminals are connected together the solution acts upon the plates, depositing a compound formed and producing an electric current, the electrolyte losing in weight.

When the cell is discharged a current may be sent through it from an external source in the opposite direction reversing the chemical re-action and recharging the cell.

The solution used, called the electrolyte, is a mixture of sulphuric acid and distilled water and the plates are of lead. When the cells have like terminals connected together they are said to be in parallel as at B, Fig. 1, and when the positive terminal of one cell is connected to the negative of the next cell they are in series, as at A, Fig. 1. Series connection gives the combined voltage of each cell, with unit current, while parallel connection gives unit voltage with the combined current capacity of all the cells. If three cells were connected in series the voltage would be three times that of a single cell or six volts, assuming the voltage of a newly charged cell as two volts.

Heavy Usage Required.

A starting battery does work which has never been previously acquired of any battery. A small six-volt battery is often called upon to deliver as high as two horse power, for a short time, and may even start a large touring car on the high gear. Therefore, a starting battery must be made of special materials or its life will be of short duration, yet it must be light and inexpensive. If the plates were made of platinum the battery would last for a long time and would be light, but the cost would be too great.

Power is not the only factor. A storage battery must be ready at all times to do its work from month to month and at temperatures from 100 degrees F. down to zero, where its output may be reduced 50 per cent.

It must also be designed to require very little attention, to be easily kept in good condition and to withstand jolts and jars such as are experienced in an automobile.

Construction of Battery.

Fig. 2 shows, in section, one cell of a Prest-O-Lite Storage Battery with part of the jar cut away to show the interior. The Prest-O-Lite cell jar is made of hard rubber, which not only provides insulation, but also resists the action of the acid solution which it must contain.

Plates are immersed in the acid solution (called "electrolyte"). The "positive" plates are connected in one group, and the "negative" plates in another. These plates are fitted in close together, separated by thin strips of wood fibre or similar material, and are so arranged that the "positives" and "negatives" alternate. Each plate consists of a framework of lead alloy, holding a mass of porous (or "active") material.

There is no "electricity" in a fully charged storage battery, simply a chemical condition which will produce electricity.

"Charging" a battery, by passing electric current through it causes a certain chemical action. The

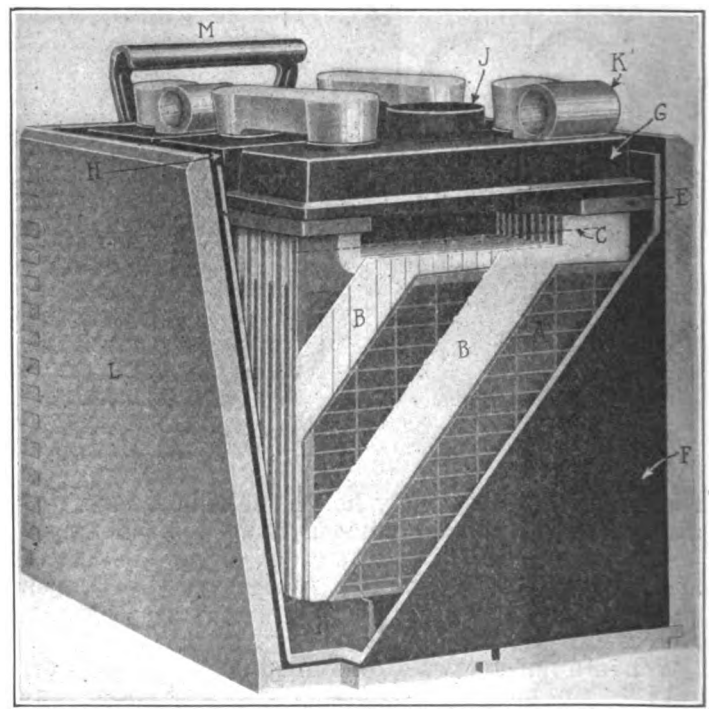

Fig. 2.—Sectional View of Prest-O-Lite Storage Battery.

battery thus "charged" is constantly striving to get back to its original condition, or "discharge" itself, and it is this chemical re-action which produces and gives off electric current.

Digitized by Google

In Fig. 2 the various parts of the battery are lettered as follows:

A. Plate combination.
Positive plate is chocolate color.
Negative plate is slate color.

B. Separators.
Carefully selected wood of extreme porosity or rubber.

C. Electrolyte level.
¼ inch above tops of separators.

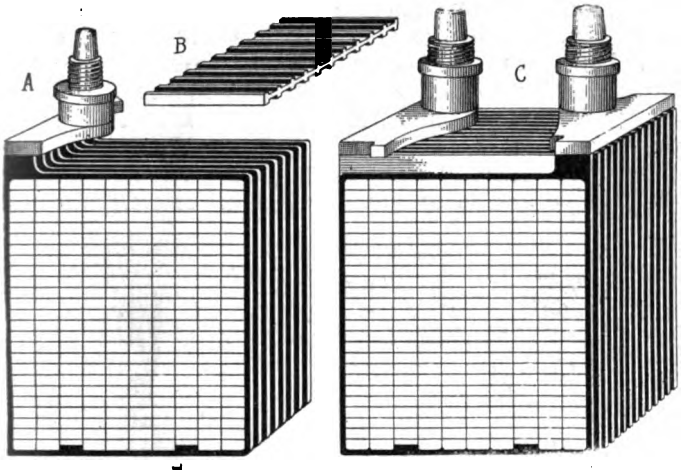

Fig. 3.—A Group of Plates at A; A Wood Separator at B; and An Element at C.

D. Bridges for plate support; positive and negative elements rest on bridges.

E. Plate connectors.
Made of substantial rugged design.

F. Hard Rubber Jars. Special Composition.
Hard rubber, tested to 24,000 volts, and rigid mechanical test.

G. Jar covers, allow expansion and overcome slopping of acid.

H. Sealing compound. Composition of high elasticity and acid resisting qualities.

J. Filler openings for filling with distilled water.

K. Terminals and cell connectors. Are made large to prevent heating.

L. Hardwood box. Selected hardwood painted with a preparation to resist acid.

M. Handles, stamped and pressed from heavy sheet metal, lead plated and enameled.

The Willard Battery positive plate grid is filled with peroxide of lead and is of a dark brown color. The negative plates are dull gray and the active material is soft, spongy lead. There are a great many varieties of oxides of lead and it is very important to select oxides that are free from impurities and have a certain density and weight for their bulk. The Diamond Grid used in making the plates of the Philadelphia Starting Battery is so designed as to equalize the strains set up in the plate by the expansion of the lead sulphate and prevents the plate from buckling. Buckling leads to short circuiting of the element and rapid deterioration of plates. The active material is carefully compounded and is applied to the grid by hand.

The positive and negative plates in exide starting and lighting batteries are of the same general design as exide plates used in vehicle batteries. A grid made of a stiff lead alloy supports the active material in the form of a series of vertical strips held between the grid bars and locked in place by horizontal surface ribs which are staggered on the opposite sides. After the grids are cast, they are "pasted" with oxides of lead made into a paste of special composition, which sets in drying, like cement. The plates then go through an electro chemical process which converts the material of the positives into brown peroxide of lead and that of the negatives into gray spongy lead. Both the positive and negative plates are provided with an extension or "lug" and they are so assembled that all the positive lugs come at one side of the jar and all the negative lugs at the other, thus enabling each set to be burned together with a connecting strap, giving one positive and one negative pole. The burning is usually done by a hydrogen flame, which melts the metal of both lugs and strap into an integral union.

A set of plates burned to a strap is known as a "group," A, Fig. 3, either positive or negative. The straps are made of a hard lead alloy and are provided with posts to which the cell connections are made.

Separators.

When the positive and negative groups are assembled together, the adjoining plates are kept out of contact by means of wood separators ribbed on the side against the positive. The separators, Fig. 3, B, are made either of tough wood particularly adapted for the purpose and given a special treatment to remove harmful substances or of hard rubber.

A special type of separator is used in the Willard Battery, 196,000 white threads pierce the rubber plate insulation and each one is 1-32 of an inch in length and of such small diameter as to be practically invisible to the eye. This insulation is used to keep the plates from coming in contact which would cause a short circuit. However, the insulation at this part of the circuit must be porous. The battery solution is drawn through the threads by capillary attraction so there is always a full flow of energy to lights and starter. At the same time there is the durability of the rubber to preserve the life and efficiency of the plates.

A positive and negative group, together with the separators constitute an "element," Fig. 3, C. The fluid known as "electrolyte" is sulphuric acid, diluted with distilled water.

The cell container is a rubber jar of special com-

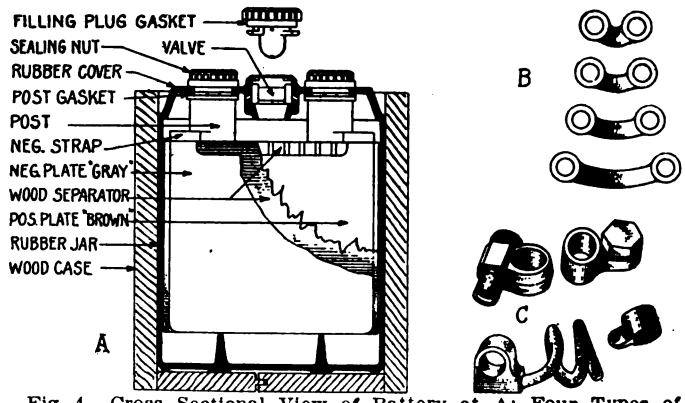

Fig. 4.—Cross Sectional View of Battery at A; Four Types of Post Connectors; and C, Four Terminals.

position which will withstand the vibration of the car and any ordinary handling without breaking. The plates rest on stiff ribs or bridges in the bottom of the jar (Fig. 4), allowing space for the gradual accumulation of "sediment."

The jar cover and method of sealing and venting

Digitized by Google

represent a radical improvement over previous practice. The cover is flanged in such a way as to give a more perfect seal to the jar than the old flat type of cover, and each cell is a separate sealed unit.

A special feature is the method of making a tight seal where the post goes through the cover (Fig. 4). The strap post has an alloy collar which supports the jar cover, a soft rubber gasket being placed between. The post is threaded where it comes through the cover and the sealing nut clamps the cover tight, the soft rubber gasket underneath giving a very effective seal.

The Electrolyte.

The solution or electrolyte consists of a mixture of pure sulphuric acid and distilled water. Acid of 1.835 specific gravity is used and is slowly and carefully poured into distilled water in a glass jar and stirred with a glass or wooden stirring rod until a specific gravity of the solution of 1.300 is obtained as shown by means of a hydrometer, the gravity being corrected one point for each three degrees change in temperature above or below 70° F. For the convenience of the user, a thermometer has been designed with a special scale on which the amount of correction is indicated. After the battery is in service sulphuric acid should never be added with the distilled water unless some of the electrolyte has been spilled, as the amount of acid in the cell must remain unchanged.

Connectors, used between posts in connecting cells in series must be heavy enough to carry the heaviest current discharge required from the battery, see Fig. 4.

There are various types of terminals used with starting batteries. Some use a flat lug and others a round tapered plug, as shown in Fig. 4.

Chemical Action.

During the charging of a storage battery the following effect takes place:

At start: $PbO_2 + H_2SO_4 = PbSO_4 + H_2O + O$.

At finish: $Pb + H_2SO_4 = PbSO_4 + 2H$.

and as it gradually discharges it acts as follows:

$$PbO_2 + Pb + 2H_2SO_4 = 2PbSO_4 + 2H_2O.$$

In these the letters mean as follows:

Pb = Lead.	H = Hydrogen.
O = Oxygen.	$PbSO_4$ = Lead Sulphate.
H_2SO_4 = Sulphuric Acid.	H_2O = Water.

When a cell is put on discharge the current is produced by the acid in the electrolyte going into and combining with the lead of the porous part of the plates called "active material," producing lead sulphate. This sulphate fills the pores of the plates preventing the free circulation of acid and causing a drop in voltage. If a fixed current is taken from a cell which will discharge it in 8 hours, the terminal voltage will be about 1.97, dropping gradually to 1.9 in about 6 hours. After this it drops more quickly to 1.8 and at last rapidly to 1.75, when the discharge should be stopped. If the discharge current is cut off the voltage rises almost at once to a figure nearly as at the beginning of discharge. If the gravity of a fully charged cell is 1.300 it will at the end of discharge be about 1.150.

Charging is the reverse of this process. Direct current is passed through the cell in the opposite direction, reversing the chemical action and restoring the acid to the electrolyte and the lead and lead oxide to the plates.

STRATTON SEMI-SEDAN.

Every day we read in the trade papers articles telling of the big amounts various people pay for converting their Ford car into another model. Not long ago a western man expended over $8,000 to make a racing car of his Ford. This simply goes to show that the Ford car is a great favorite among those owners who have the money to spend for a larger car, but prefer the smaller and lighter car.

Many people admit that the Ford, as a machine, is an excellent proposition, but do not like the body lines, and so hesitate to buy the "universal car." For this class of people the Stratton Semi-Sedan type of body, made by the Stratton Motor Car Company, Webster building, Chicago, Ill., has been designed.

As the illustration shows, this body is wholly distinctive and is unquestionably different from the

THE STRATTON SEMI-SEDAN

conventional type of body. From the front to the rear, the body is of streamline design, but has no curves. Every line is sharp and smooth, and one is strongly reminded of a swift racing boat, with a torpedo stern.

To apply this body, the Ford chassis is extended 30 inches, giving a total wheelbase of 130 inches, and producing an easy-riding car. The body is designed for four passengers and is finished in a baked-on enamel. The standard body is cream color, but at a slight additional price other colors may be had.

One of the features of this body is the semi-sedan top, which is supported on six posts and fitted with quick-fastening side and back curtains. At the present time the manufacturers are designing glass windows to take the place of the curtains for converting the car into a limousine for winter weather.

The body inside is extremely roomy and is upholstered in green imitation leather, called DuPont's Fabricoid. With the body is furnished a Stewart vacuum tank, with pipe and connections so that the fuel tank may be placed at the rear of the car.

Many New Positions Open.

The branch office of the Inspection Division, Ordnance Department, 600 West Jackson Blvd., has immediate need for two hundred fifty to three hundred inspectors. At the present time positions of inspector of field artillery ammunition and inspector of carriage division are open. Both these positions pay a salary of $3.50 to $5.00 for an eight-hour day and time and one-half overtime. These positions are in the vicinity of Chicago. It is anticipated that many more examinations will be opened up immediately. Female applicants between the ages of twenty-one and fifty, male applicants between the ages of thirty-one and fifty will be considered.

Applicants are especially needed who have had

Digitized by Google

artillery ammunition, carriage, motor, small arms or small arms ammunition experience. There is immediate need for the services of these inspectors and applicants are requested to report to Mr. Becker, 600 West Jackson Blvd., Chicago, Illinois, for interview and application blank.

N. A. A. J. ANNOUNCEMENT.

At the Virginia Hot Springs Convention of the National Association of Automobile Accessory Jobbers, the Board of Directors by practically a unanimous vote will bring forward a number of recommendations as follows:

First:—That the annual meeting be held the last week in October rather than in January.

Second:—That at the annual meeting in October they hold an accessory show which would afford the jobbers a chance to see the latest inventions and enable them to secure illustrations, lists, etc., for their catalogues.

Third:—That the sessions of the convention be held from 10 a.m. to 1 p.m. and adjournment then taken.

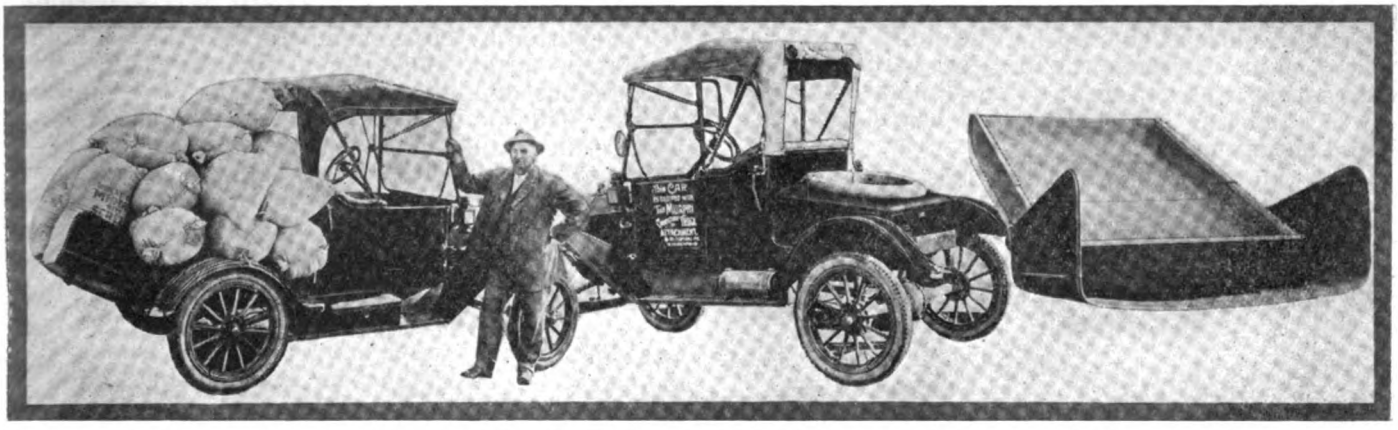
During the forenoon only dealers will be admitted to the exhibition; and at 12 o'clock exhibitors, manufacturers, jobbers and their aids.

The full text of this announcement may be obtained by writing the National Association of Automobile Accessory Jobbers, 1813 City Hall Square Bldg., Chicago, Ill.

Commercial Ford Body.

The P. J. Murphy Company of Minneapolis, Minn., through their factory representative, C. L. S. Holmes, 702 Boston Block, Minneapolis, Minn., are marketing a special Ford body, which is illustrated herewith, and which seems to be of a unique as well as interesting design. When closed the body gives a general appearance of a Ford roadster and is arranged so that a spare tire may be carried on the top of the cover, with a lid which opens inside the tire, permitting access to the rear compartment. To form a truck, the entire back cover is swung backward, permitting one to slide out a telescoping steel box, which engages under the steel strap across the inside of the cover. With the back open, the truck body is exposed. When used as a truck, the loading space measures 32x69 inches and has a carrying capacity of 1,800 pounds. The steel used in the construction is of 16-gauge and heavy enough to last for the life of the car.

This body should be of great interest to the garage owner as well as to small business concerns who have need of light trucks for carrying varied loads. These bodies are made to fit the rear platform of any model Ford car and may be attached in a very few minutes.



When in the Mud.

It is a natural impulse when the car stalls in soft going to jam down the accelerator to get all possible power from the motor. But if the car has stalled because the rear wheels cannot take hold in soft mud and are slipping around, this is not the best way out. The whirling wheels simply dig down deeper. It is better, after shifting into low, to let the motor run at comparatively low speed and edge the clutch in gently. This will give the rear wheels a better chance to take hold. Often one can get out better under these conditions if there is a load in the rear seat.

If the wheels continue to slip at slow speed, it becomes necessary to tie ropes about the rear wheels or to throw straw or brush under them. With a light car one can often help it forward by placing one end of a stout plank or pole under the rear axle and with the leverage thus gained lift it forward while another applies the power slowly.—Milestones.

A Big Carload.

A few days ago a carload of 600 crank shafts, all of which were ground, drilled and polished, was shipped to the Waukesha Motor Company, Waukesha, Wisconsin, by the Automobile Crank Shaft Corporation of Detroit. These crank shafts will eventually be used in engines for truck and tractor service. The average weight of each crank shaft was 80 pounds, thus bringing the total load up to 48,000 pounds and as each crank shaft was crated separately, the total weight of the crating and the shafts together, averaged considerably more than that figure. Under ordinary conditions crank shafts are shipped in less than carload lots and usually in lots of one and two by express, and this large shipment simply goes to show the present activity of the truck and tractor market.

Lining Up the Main Bearings and Removing Timing Gears

To Insure Satisfactory Engine Operation and Prolong the Life of the Machine, the Various Bearings Must Be Repaired With Care

BY J. N. BAGLEY

There is probably no part of a motor car that requires more careful attention than the bearings of the engine and the gears. Much care should be given them, however, for upon the bearings depends the usefulness of the whole machine. Almost every day we can see a car come down the road, or street, and above the rattle of the car one can hear the bearings knock. When the bearings are allowed to knock for any length of time they will become out of true and be thrashed out of their setting, allowing the polished shafts to come in contact with the rough metal holding the soft smooth bearing, and the result is a costly repair.

Repair Main Bearings.

In overhauling the engine one should begin at the crankshaft and take up every bearing. There are times when the bearings, especially the main bearings, get out of line, and to put the engine in good shape it will be necessary to line the bearings before adjusting them to the crankshaft. A very good plan is to make a test before attempting to make any adjustments, and by so doing save a great deal of time. Take a shaft of rolled steel, exactly the same diameter as the bearings of the crank shaft and rub over it a quantity of prussian blue, at the points where it comes in contact with the bearings when it is put in the place from which the crank shaft has been removed, as shown in Fig. 1, at E.

Now bolt the bearing caps B, C, D, down just tight enough so that the shaft can be revolved with slight pressure and turn it a few times. Remove the caps and note how much of the surface has taken the blue from the shaft. In case one is not able to judge the correct pressure of the caps on the shaft, it will be a very good plan to make the first test without placing the bearing caps and in so doing eliminate any danger of springing the shaft into a bearing where it would not lay naturally.

Scraping the Bearings.

After the bearings have been tested for alignment and found out of line, it will be necessary to either

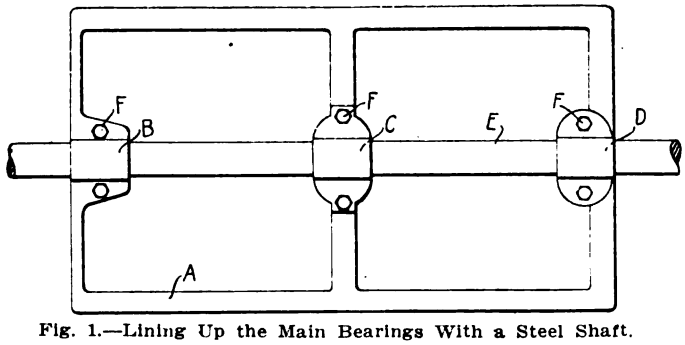

Fig. 1.—Lining Up the Main Bearings With a Steel Shaft.

replace the bearings with new, or with a bearing scraper, remove the high places, bringing the bearing in line with the remaining number. Many times scraping is not a good plan, for it entails the removal of a sufficient amount of the surface from the bearing to cause the gears to mesh entirely too deep. This results in wear and a constant hum in the timing gears. One must use judgment as to the amount of metal removed in this manner, and be sure to leave enough metal so that the timing gears will mesh correctly without grinding or howling.

During this work, the case, A, should be supported in a position so it may be repaired without standing or sitting in a humped position, or in fact any position that will cause one to be uncomfortable, for in this condition the mind is not given wholly to the work and little essential points will be overlooked.

After the bearings have been replaced or scraped so that they all are in perfect alignment, the crankshaft should be examined very carefully for defects, such as flat bearings, sprung throw or a flaw caused by a faulty connecting rod. A flat place on the bearing surface as shown at D, Fig. 2, must be repaired or reground, for it is impossible to keep a bearing tight in this condition. The rod may be adjusted so that it will fit perfectly on one-half of the bearing, but when it is turned one-quarter over, it will either be so tight that it cannot be worked, or it may be so loose that it will knock. At the present time crank shafts are so reasonable in price that it is not a good policy to place a shaft that is flat on the bearing surface in an engine. Then again at A, in Fig. 2, we have a part that many times becomes sprung, owing to the fact that a rod has come loose while running and when the shaft turns over, with considerable speed, it strikes the loose rod, knocking it against either side of the crank case, and if it comes against some part of the case that is quite well supported by cross members the crank shaft is liable to be sprung enough so as to bring the bearing surfaces out of line and make a very poor running engine. This defect can be determined usually by placing the crank shaft between the centers of a lathe and revolving it, trying it for trueness at several different points. In case it proves to be sprung at any point it should be replaced with new, for there are very few novices capable of straightening a twisted crank shaft so that it will give service again.

The Main Bearings.

In Fig. 2, we have a main bearing, showing the manner it is placed together holding the shaft, F, in position. We have at C the metal used for the bearing, usually babbitt or white brass. In case the bearing becomes worn to any great extent it will have a tendency to wear on two points and that on points exactly opposite one another. To adjust this sort of bearing remove the locking screws, B, and remove one or more of the shims at E, until the bearings fit. Now that the main bearings are adjusted and the shaft is ready to place it will be a very good plan to fit each of the connecting rods while the shaft is still out of the case. In piston 4, Fig. 2, there are two bearings, G, one on each side of the rod end, thru which the crosshead pin, called

Digitized by Google

the wristpin, passes to hold the piston to the connecting rod, H. In case these bearings are loose, a very good plan is to replace the worn bearing at this point with new, for few engines have a satisfactory adjustment at this point, and besides, bushings are not at all expensive. The lower end of the rod, H, is supplied with a cast babbitt bearing, which can be taken up and scraped to fit the shaft, J, with little trouble. The bearing should be adjusted so that when the lower cap, K, is set snugly the weight of piston, H, will gradually draw the rod down very slowly. This is about the proper tightness for the

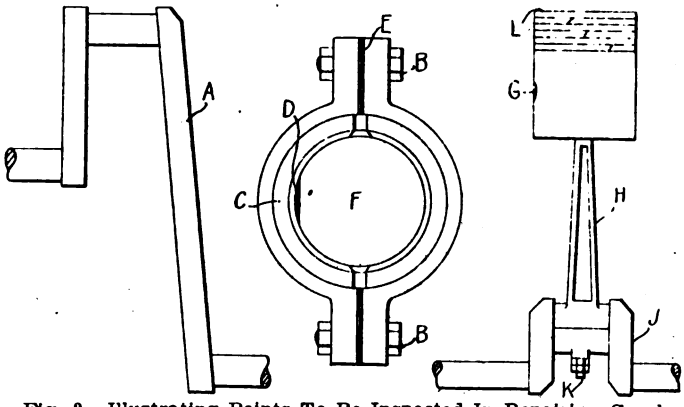

Fig. 2.—Illustrating Points To Be Inspected In Repairing Crankshafts, Connecting Rods, and Bearings.

connecting rod bearing. One should not overlook making the nuts secure on the connecting rod cap bolt, K, for if these become loose they will play havoc with the engine.

Fasten Caps Securely.

The caps holding the bearings in place, as shown at F, Fig 1, and K, Fig. 2, should be securely fastened before attempting to place the engine in the car. Many prefer to use cotter pins, but a very good plan is to tie the bolts together with a piece of tough wire, for in most cases the studs are screwed into the case, which is usually softer than the nuts on the outer ends of the studs, and if a cotter pin is used to prevent the nut from working off, the entire assembly of stud and nut and pin might work loose and come out.

Many times one will experience quite a little difficulty in removing the gears from the different shafts about the engine, but if a wheel puller is used, something on the order of those illustrated in Fig. 3, there will be very little difficulty in removing the gears. In the first sketch, we have a very simple gear puller, which consists of a yoke of steel, C, into which is screwed a pusher bolt, E, and a couple of lips, D, bent on the ends to lock over the gears, A. Now, by turning the bolt, E, the gear is gradually pulled from the shaft, B, with little trouble. In case the gear is hard to start, when one thinks the proper amount of pressure has been applied to the screw, it is a very good plan to strike a gentle blow with a hammer on the end of bolt B, and with the pressure already applied, the wheel or gear will slip.

A Useful Puller.

Another and very useful puller is made as shown in the same figure at the right. This particular puller can be used for pulling a number of different sized gears and is an idea worked out by the writer. The plan is very much the same as the first one described, except that it has some advantages not found in the plain puller. This device consists of a bar of steel, G, into which is screwed a bolt, F. Each end is slotted to allow the pulling arm to be bolted in at H. The arm has a number of holes drilled to allow different adjustments and to accommodate different sized gears. The upper end of the arms at J have set screws which will prove valuable in many instances in preventing the arm, K, from slipping from gear, M, while it is being pulled from shaft, L. By tightening the screws, C, in each of the arms, they cannot spread at the bottom and come off, as they often do without the set screws.

In assembling the different parts after the necessary adjustments and repairs have been made care should be taken that every chance of a leakage of oil should be taken care of. All gasket surfaces should be thoroughly cleaned and all the old gasket material, as well as all cement, etc., removed. Prepare the new gasket and stick one side of it to the case and note that all corners are filled with a clean, fresh gasket so that when the lower half is placed in position it will be absolutely oil tight. Oil costs money and should not be wasted, but not only this, a leaky case is dangerous, for it is impossible to tell just exactly how much oil is in a case and how far it will run before new oil should be added.

Examine Flywheel.

The flywheel should be securely fastened to the crank shaft, for in case it has once worked loose it will seldom stay tight afterward, owing to the fact that flywheels are machined to fit very closely, and a little working from time to time will wear the inner hub bore, until it fits loosely. Sometimes the shaft to which it is fastened becomes worn sufficiently so that it is next to impossible to keep the wheel tight. A loose flywheel will cause a deep and heavy knock much resembling the knock of a rear main bearing and is hard to locate oftentimes, unless one has had some experience with loose flywheels.

When roller bearings are worn sufficiently to make an excessive looseness it will be necessary to replace with new, for there is very little chance of adjustment, unless a new sleeve will serve the purpose. Ball bearings can be repaired much better than roller in some instances, for over-size balls may be supplied in place of the old ones, in case the cones and cups are in good condition and not worn or cracked. In case the ball bearings are of the annular type it will be necessary either to replace with new, or send

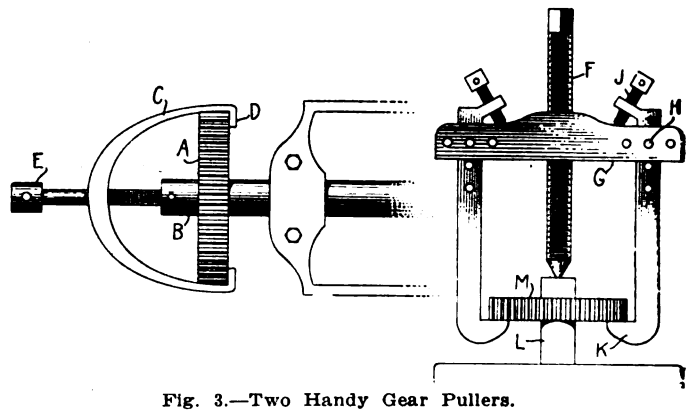

Fig. 3.—Two Handy Gear Pullers.

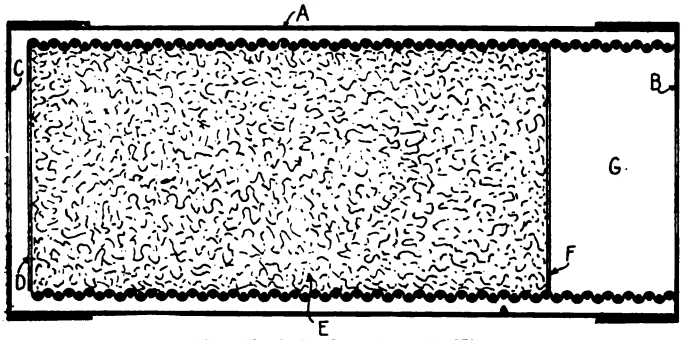
them to some one having the necessary equipment to regrind them.

Camshaft Bearings.

The camshaft bearings will require attention at the time the overhauling is done, for worn camshaft bearings allow the camshaft to back off from the push rods under the strain of the valve springs and

Digitized by Google



the valve action will be affected to quite a little extent, thus resulting in a direct loss of power. The valve lift is not sufficiently great to stand any great amount of waste and still perform its function correctly, therefore it is necessary that the lift of the valve should be kept as near as possible to the standard as figured by the engineer designing the engine. The space between the valve stem and push rod should be adjusted very closely for a two-fold purpose; to give the maximum power and to eliminate the noise that comes from looseness at this point.

CARBON FORMATION.

Accumulations of Dirt and Dust Are Often Wrongfully Termed Carbon Deposits.

In our last issue we considered the heavy fuel problem, which is bothering the owner to-day, and one of the results from the use of this fuel we find to be carbon deposits in the firing chamber.

Now, heavy fuel is not the only item which makes for carbon formation. Many engineers throughout the country have disagreed as to the main reason for the accumulation of carbon in the cylinders, and many of them seem to think that the carbon actually formed by the burning of fuel and lubricant is of minor importance. The real formation is a dirt and dust base, rather than a strictly carbon base. If we consider this as a fact, and undoubtedly dirt plays an important part in the formation of carbon, let us consider the various ways in which dirt might enter

A Practical Carburetor Air Filter.

the explosion chamber and the methods to use in preventing this entrance. Very little dirt can enter through the fuel line and usually where dirt enters in this way the carburetor action is impaired and the engine does not function properly, for the fuel passages are usually small and do not permit the passage of large particles.

Dirt Enters Air Intake.

Much of the dirt which finds its way into the cylinders enters the manifold through the carburetor air intake. This sort of dirt is usually composed of road dust, fine sand, and road oils, and when one stops to think of the amount of dust on the ordinary street one wonders why the automobile engine of to-day stands up under the strain as well as it evidently does.

If anyone doubts the statement of the engineers, when they tell of the entrance of dirt through the carburetor air intake, let him examine the inside of the automobile dustpan. Let him clean out the dust pan thoroughly with kerosene oil and run the car over average roads for a distance of one hundred miles and then examine the dust pan again. He will probably find dust accumulations which may have a thickness of 1/16 of an inch, thus proving that even though the carburetor is protected to a certain extent a great amount of dust passes through it while it is being operated.

Aside from the fact that this dust causes trouble from carbonizing, it has much to do with the wearing of the cylinder walls, and when taken into consideration with the heavy fuel problem, offers the solution for rapid engine destruction. Every car owner should do his best to prevent the entrance of dirt and dust into the carburetor and should he not be able to afford a manufactured air filter, he should make one himself.

Home Made Filter.

Obtain a length of small stove pipe, A, about three and one-half inches in diameter and about eight inches long, and fit both ends, B and C, with covers. These covers may be obtained from cocoa, coffee, or other large cans. Through each cover bore or cut a hole about one inch and a half in diameter. The one at B should be just large enough so that it will slip easily over the carburetor air intake or over a tube attached to the air intake. Now take a piece of coarse wire mesh and bend it into a cylinder as shown at D. This cylinder should be soldered to the cap, B, its whole circumference, and should be about three inches in diameter. At F a partition should be made by passing or weaving a number of fine wires through the cylinder, and the space E filled with steel wool, which has been pulled to pieces and packed in very lightly, so as to leave an open passage for the air. After the steel wool has been put into place the end D should be covered by a piece of coarse mesh, such as used for the cylinder. The chamber shown at G should be about one and a half inches in length. The cylinder should then be covered with one thickness of coarse cheesecloth and the cover C put into place. At any time the cover B may be removed, taking with it the cylinder and its steel wool filter, the end D removed and the whole cleaned very readily. To prevent the formation of rust in the steel wool, the wool should be dipped into lubricating oil and allowed to drain for a period of an hour or so. Every two or three hundred miles the apparatus should be cleaned, and one will be surprised at the amount of dirt that the little device collects in the course of a season.

BIG BUSINESS POSSIBILITIES.

Albert Champion Talks to New England Jobbers and Summarizes Present Trade Conditions.

At the last New England accessory jobbers' dinner, Mr. Roy LePellatier gave a dynamic talk on the healthy condition of the automobile business and the big possibilities in all its branches. Following Mr. LePellatier, Mr. Albert Champion, president of the Champion Ignition Company, gave an interesting speech which is quoted in part as follows:

"My main object," Mr. Champion said, "in asking you to join me here is that you might become better acquainted with each other as a better understanding will result in better business relations.

"I attended a luncheon yesterday at which Mr. Alfred Reeves spoke to five hundred dealers, urging them to join the New England Dealers' Association in order to bring them into closer relationship with each other. He outlined all the benefits to be derived from co-operation and cited this instance for comparison; The National Automobile Chamber of Commerce, of which he is manager, owns over 600

Digitized by Google

automobile patents and any manufacturer who has been in business for a minimum of one year, operating in a successful and legitimate manner, can join the Chamber of Commerce and get the benefit of all those patents. This has been a very great factor in making the automobile business successful. Just consider for a minute the condition of the industry if each manufacturer owned a few patents and all were continually fighting each other. Fortunes would be spent in litigation and the industry could never have grown, as capital would have been scared away. No one can deny the success of the automobile industry and this condition applies to you as well as it does to the automobile manufacturers.

An Improvement in Attitude.

"I am glad to state that I have found a marked improvement in the attitude of most jobbers towards their competitors. A few years ago when calling on jobbers I would hear so many grievances and so much 'knocking' that I wondered at times why these firms stayed in such a business themselves. Getting together is undoubtedly what has helped, as not only you get acquainted, but you can stop many evils that are detrimental to your business. For instance, you will find on the jobbers' shelves special brands of goods and lines for which there is no demand but which have the doubtful merit of being cheap, and when it is pointed out to a jobber that it is impossible for him to build a satisfactory business with that class of goods, as even if he does sell them the dealer will be 'stuck,' most of them will answer: 'I know it isn't good; I also know there isn't any demand but our competitor has a cheap line, is handling a special brand and we must have something to meet that competition.' That kind of competition isn't doing the jobbers any good. It simply results in raising their cost of doing business, due to the small percentage of profit they make. The goods must be sold cheap and in many instances gotten rid of below cost. While this hard work is being done to salvage as much as possible from the original investment the quality lines are being overlooked as all attention is given to these cheap lines.

"The successful automobile dealers today are the ones that handle good automobiles, and the successful accessory dealers are the ones who handle good accessories. If you are going to build up your business on the right kind of basis you will have to think of the dealers. If you are going to give him advice or suggestions regarding the lines he should handle don't hand him a job lot article or an unknown brand that he cannot sell.

Obtain Customers' Confidence.

"The only satisfactory way to build up business is to earn the confidence of your customers. Confidence will bring dealers to trade with you just the same as you personally go to the merchant in whom you have confidence, whether it be a grocer, shoe store or your tailor. The success of the accessory business is in your own hands but you can only make it successful by handling quality goods. The lines should be selected carefully and you should investigate the methods of the manufacturer you are dealing with.

"I wish to touch on the subject of your sales organization. It is an excellent idea to give the salesmen an opportunity to check up their own work by furnishing them periodical reports of what they are doing. How are we going to bring the accessory salesmen up to the highest standard? I believe that the management and salesmen should have meetings and 'get together' frequently as in such meetings experiences can be compared, customers can be discussed, the salesmen can express their opinions and relate what they may be 'up against' in their particular section. In these meetings the management has the opportunity to inspire the men with confidence by helping them and letting them help each other; by not merely telling them 'go out and sell this,' but by asking their opinions and letting them realize that they are an important part of the business, as no jobbing firm is better than its selling organization and confidence is what makes success possible.

Read Trade Papers.

"Another important matter is to read the trade papers. Keep posted on what the automobile industry is doing; read the articles that are written by merchants expert in the handling of accessories; take out subscriptions so that each one of your men will receive a trade paper at home. Possibly they do not think of buying trade papers or just buy one once in a while. Every salesman is trying to better himself and they will find automobile trade papers a great help.

"With the right kind of goods, well organized selling forces and good service, you will undoubtedly increase your volume of business and increase the business of your dealers. This increase means lower cost and reduction of cost means higher profit. Volume is what makes big profit and the best illustration I can think of is the Ford Motor Company. A short time ago, on account of taking on war work and reducing their output to about 50 per cent. they have to increase their selling price $93.00 per car which means an increase of 24 per cent. Just think of it! The same condition applies to your business. If you can make your volume great enough, you will be on the same basis as Ford who only had a very small overhead per car. Consider that to-day their increased overhead must be at least $80.00 per car. Of coure we realize that you must have the right percentage of profit to start with but there is only one way to increase that profit and that is by reducing your cost through volume.

Carry the Right Stock.

"The question of carrying the right stock is just as important for the dealer as it is for you, as in getting them to carry a complete stock of the best lines you are making it possible for them to take care of their customers. You are giving them goods that move and make money. You are making them a good credit risk because you are helping them to become successful accessory dealers. The dealers need your advice and those who are willing to accept it do so because they have confidence in you. If they have confidence in you, you should justify it by giving them the right kind of advice and keeping that confidence."

Army Motor Trucks Arrive in New York.

What was probably the longest train of government motor trucks ever seen in New York City arrived last week, in charge of Major G. F. Bailey, one of the oldest motor truck commanders in the United States Army. The truck train left Buffalo three weeks ago and came to the city by way of the Boston Post Road and Pelham Parkway from Connecticut. The train carried several hundred tons of supplies and was accompanied by a motor truck tank containing a supply of fuel.

An Interesting Camping Trip to Florida

One of Readers Relates His Experiences in His Two-Thousand Mile Trip and Tells How He Constructed a] Camping Outfit

BY E. S. PURDY

The writer and his wife, all there are in the family, together with the little black dog "Coalie," have just completed an automobile trip of over 2,000 miles from their home in Amsterdam, Mo., to Brodentown, Fla., on the west coast south of Tampa.

We camped every night, rain or shine, and it was mostly rain, never had a cold, never a moment's

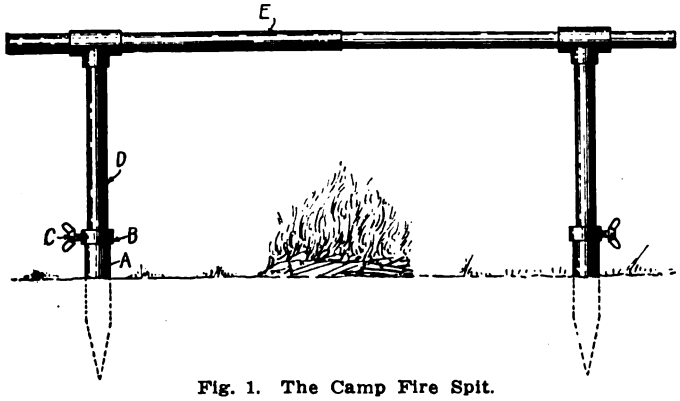

Fig. 1. The Camp Fire Spit.

sickness, never before had such appetites and never before slept so soundly at night. We loafed on the way, taking two months to make the trip, the engine never missed an explosion all the way, and the only repair made was to a broken leaf in a front spring. When I further add that my wife is nearly an invalid and never slept anywhere except in a warm bed, I consider the trip a remarkable one. We came here to escape the rigor of our northern winter.

The automobilist who only drives around on the boulevards and paved streets of his city, or perhaps gets out in the country a short distance, has no conception as to the number of people with cars who are going everywhere and camping on the way. Visiting relatives in other states, sight-seeing across the continent, each one following his own ideas as to equipment, and we met them by the scores, with trailers, with tents, bags and baggage piled all over the car and hung from anything solid enough to hold; traveling by automobile means a happy, carefree, healthy life, out in the open and close to nature.

While the writer had a camping trailer with him and actually lived as comfortable as at home, this article is written for any suggestions it might contain for the man who wants to go and take the family, but cannot afford to incur the expense of a trailer and does not care to take three meals a day at the hotels and restaurants in the towns through which he passes.

Since meals at present vary from 50 cents for but little to $1.25 for a satisfying meal, and a party might consist of two adults and from one to five children, three meals a day means a heavy expense.

The camping subject is too large to admit the discussion of all features, so this article will deal with the cooking and meal question only.

I may now consider myself a veteran, but if anyone ever was green I certainly was when I got my first lesson from my good friend Charley Beall, a royal fellow, social, intelligent, thoughtful, brave, sympathetic and true as steel. At the time he and his family, myself and my wife were fishing in the lakes of Minnesota. We took what we called a raw lunch with us for dinner; that is, uncooked food. Our equipment was what we obtained at the hotel and consisted of the food, dishes, a battered coffee pot and the regular short handled skillet. Now if you have ever fried bacon, eggs, or potatoes over a camp fire with a short handled skillet, you know how hot your face got, how your hands burned, how the smoke rose into your eyes and a lot of other things. So right then and there I determined to devise and construct an outfit that I could cook with in comfort and that would be light, small, compact and portable, for the first mistake a beginner makes is to burden himself with too many things which make too much of a load. So I determined to make a careful study of the subject and construct an outfit I could carry by hand if necessary, and which would occupy but little room in an auto or boat, but yet be varied enough to answer all requirements.

Cooking Frame.

I will attempt to describe how I built my cooking frame, shown in Fig. 1. I took two pieces of gas pipe, A, each 2½ feet long, heated the ends and hammered them to a dull edge like a chisel. Upon the other ends I put a band of iron, B, measuring ¼ inch thick and ½ inch wide. These bands around the ends made the posts solid so that they could be pounded, and the chisel edges made them easy to drive in the ground. Through the bands and the pipes I had holes cut and threaded and thumb screws put in, as shown at C. Then I obtained smaller

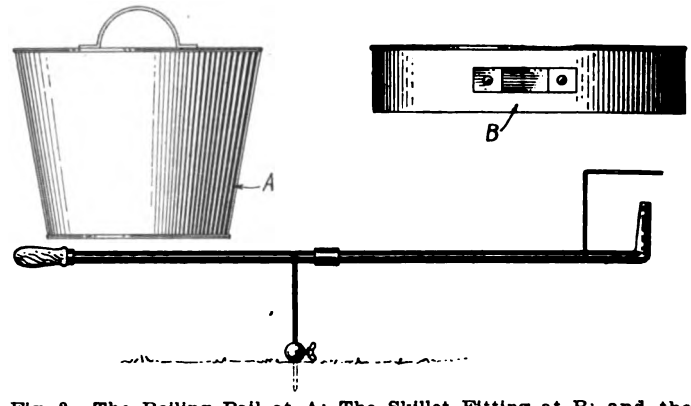

Fig. 2. The Boiling Pail at A; The Skillet Fitting at B; and the Skillet Holder.

pipes, D, that would go inside the larger pipes and on one end had a pipe, T, threaded. So you see I could put the small pipe inside the larger one, set it any height desired, turn the thumb screw up

Digitized by Google

tight and make a solid fitting. Then I obtained two other pieces of pipe, E, of equal length, one telescoping the other, so when pulled out, but still supporting each other, they would be four feet long.

This is the way it is used in actual work. The chisel edge is driven into the ground far enough to make it reasonably solid, but not so far that it will

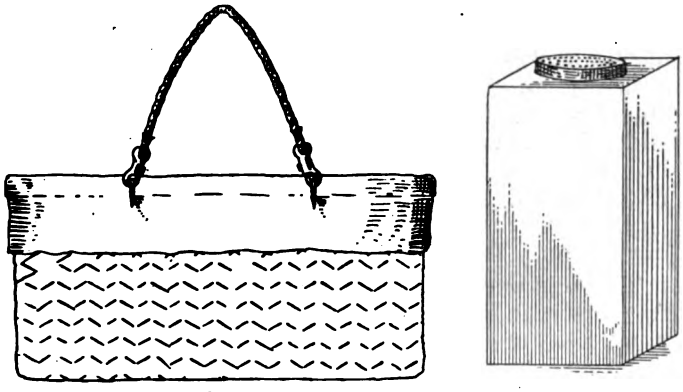

Fig. 3. The Camp Basket and Salt Shaker.

be hard to pull out. In this I put the smaller gas pipe with the T on the end, set it the height I desire and turn the thumb screw tight. I had the wings of the thumb screw big enough so I could obtain a good purchase; I then set the other standard about three feet from it and take the two pieces of telescoped gas pipe, put one end through one T, draw out the inside pipe and put it through the other T, leaving the smaller pipe in the larger far enough to sustain the weight required. So my cooking frame set up for use looked like Fig. 1. On the cross piece may be hung the coffee pot, a pot to boil potatoes, tea kettle or any other cooking utensil. By having the uprights telescope one can raise the cooking utensils, should the fire become two hot, or if it should be too small the cross piece could be lowered, bringing the cooking utensils closer to the blaze. One cannot always have a level place to camp, and if on a hill one side can be raised and the other lowered until the cross piece is level. Again, when in the open one might want a second cup of coffee, possibly a third, for open air is a medicine that gives one an appetite. By the time one has cooked the meal and eaten part of it the fire is quite low, and to be sure that the second or third cup of coffee is hot, the cross piece is lowered so the coffee pot rests on the embers. Never set the coffee pot or any vessel on the fire unless supported some way, for if you do, some piece of wood will burn down and your coffee pot will tip over, then there will be no second or third cup, and maybe no first. Now as to the way I pack this device. I push the small pipe of the cross piece into the larger, loosen the thumb screw in the two uprights and drop the small pipes into the larger. I now have three short pieces, which I roll in a canvas the right size and buckle a strap around them. I use the canvas because soot gets into the pipes and dirt adheres to the ones driven in the ground, but when rolled in canvas and strapped there is no danger of soiling anything else by contact with them. An outfit might be made still lighter in weight by having the inside section of the upright made of solid iron and the lower section smaller pipe, and the same with the cross piece. I have both kinds, but the light one bends too much under load and sways more than I like, so I use the heavy one.

Now as to the method of suspending the cooking utensils from the frame over the fire. Take wire sufficiently strong to sustain the weight and bend it into shape like a letter S. Make enough of these to suspend all the vessels from the frame clear down to a low fire. Make some of them long, some medium, some short, so that by hooking various lengths together you can secure any required length.

For a dish in which to boil potatoes, eggs or any other eatables, obtain a bucket of the size required for the party. As there is only myself and wife in my family, we use a two-quart pail. Don't get tin or anything that is fastened together by solder, as the heat of the fire will melt it, and the bucket, coffee pot or anything else will come apart. We use granite ware. Now, lids on all buckets and coffee pots fit too closely, so I took the rim off the lid of the bucket I used and had another put on. The new rim is wider and with a very decided inside pitch. Lids usually have knobs with which to lift them off. I had the knob taken off ours and a half ring of rather large size soldered on in its place. The reason for these changes is that the fire, especially at first, is very hot and will make it very inconvenient for one to remove a close-fitting lid. With a vessel suspended over a hot fire, one cannot handle the cover at all with the hands, so I obtained a lightweight stove poker, with a handle made of coiled wire and cut the poker off to a convenient length, then bent a hook on the end. With this hook I can lift the bucket off the fire, or lift the lid when I want to see if the contents of the dish are done. The lid and bucket, fixed as I have described, would look like A, Fig. 2. Of course, all vessels to be suspended over fire must have bails and not handles. This cover as described applies to the coffee pot and all other vessels that may be used which are to hang over fire.

Skillet Holder.

Next come the skillets. I bought two large size steel pressed skillets, had the handles taken off close to the body, making them just round pans. Then on the outside, midway between the top and bottom, I had an iron loop riveted on like B, Fig. 2.

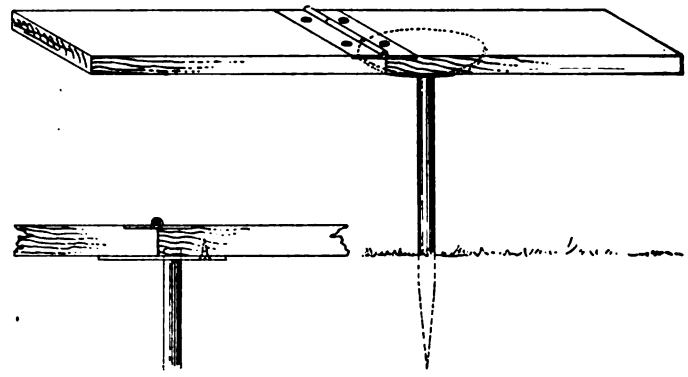

Fig. 4. A Handy Table for the Camper.

The opening in the loop was about ½ inch long and ¼ inch across. Next I had a piece of gas pipe flattened at one end and curved into a convenient shape for a handle and turned up at the end to fit into the

Digitized by Google

iron riveted on the side of the skillet described above. Next I had a small hole bored in the flattened end of the gas pipe handle just above where it was bent to go in the slot on the side of the skillet. Into this hole I inserted a hook made of wire, with the ends turned at right angles, to go over the top of the skillet. This fitting was made very exact, and I had to use pressure to turn it over the skillet cover. The other end of the handle was threaded and a second piece of gas pipe, of the same length and size as the first, attached by a union. On the other end of the second pipe was fitted a wood handle. This, you see, now gave me a long handle, and I could hold the skillet over the fire, yet be far enough away so as not to get hot and uncomfortable. But the first season I found when the skillet was full of fried potatoes, or eggs, or anything else, it was pretty heavy to hold at that length, so I got an old wagon umbrella, took one of the braces and attached the hinged end to the center of my handle so that the rib hung pendant. When cooking in the skillet, this rib hung down and made a rest for the device. I found, however, that, in sand, the small rib of the umbrella would sink too deeply, so I obtained an iron ball about the size of an average marble, made a hole in it, fitted it with a thumb screw, and slipped it over the rib, a device which kept the rib from sinking in the sand. I had both handles and the attachment on the side of the skillet made all of a size, so no matter which part was picked up first, it fitted, making all parts interchangeable. With this arrangement the handles unscrewed, leaving short lengths which could be carried with the cooking frame in the canvas. The completed device is shown in Fig. 2.

Dish Basket.

The basket, in which I carried dishes and other things, was oval in shape and of a capacity about twice that of an ordinary market basket. I took off the handles and in their place, one-third of the way from each end, at the top, in the strong wood, I inserted screw eyes. Then I made two rope handles, and on the ends of the rope tied medium sized harness snaps. I next obtained a piece of oilcloth, big enough to cover the basket and reaching to the bottom. Where the rope handles were fastened I cut a slit in the oilcloth, so that the rope could pass through and snap in the screw eyes on the basket. With this arrangement the handles did not stick up in the way, and the basket was waterproof. On the inside of the basket I tacked pockets to hold soap and other small articles.

There are two kinds of dishes suitable for camping: aluminum or granite ware. I prefer the latter. I purchased cups for coffee, water, etc., that had flat bottoms, for they had broad bases and did not upset easily on irregular ground. I used a dozen plates and six cups. For vinegar, I carried a pint bottle, with a cork and screw top. Sugar was kept in a baking powder can. For salt and pepper I obtained two aluminum boxes with screw tops. The skillets I packed first in the bottom of the basket, then nested and packed the balance of the articles under the cover. I carried an oilcloth to be used as a table cloth. Automobile cushions make good stools to sit upon and keep one from the ground.

Refrigerator Basket.

For lard, butter, cream, ice water, etc., we had a refrigerator basket, several of which are on the market. These are very convenient, and we had ice water all day long, and everything kept fine. We kept condensed milk for our coffee in a corked bottle. Lard and butter was kept in small granite buckets holding a little over a pint. Spoons were of malaga tin, cheap but serviceable. We carried regulation knives and forks and a big butcher knife for general purposes. We liked good meals, and frequently carried jam, preserves and other dainties. In the side of the basket I also had a pocket in which I carried a safety hatchet. This device is a hatchet with a shield which folds back in the handle when in use and folds down covering the cutting edge when not in use. In the outfit I had also a lightweight, long wire toasting fork with open wire handle so it could be hung on the end of the cross sections to the cooking frame. This we used for toasting bread.

There is one more item which completes the outfit for automobiling. When cooking in the open one must use, of course, lard, butter, eggs and greasy knives, forks and spoons. If these are placed on the ground they are soon filled with ants, worms and all kinds of creeping things. To prevent this I had two boards, light but strong, measuring 15 inches long, ½ inch thick and hinged in the middle so they folded together one way and were self-supporting, the other giving a flat surface. On the under side, when open, I had a small, round iron plate fastened to one board only, but arranged so that the other board rested on half of it. In the center of the plate I had a threaded hole, into which was fitted a gas pipe of a convenient length, flattened one end and threaded on the other. I drove this standard in the ground, opened the boards, screwed the top on the standard or leg and had a little table on which I could place the lard, butter, egg dish, or cooking utensils. They were then out of reach of ants and worms. The standard I carried in the canvas roll and the top on the basket. The full equipment, then, consists of a small canvas roll, a refrigerator basket about the size of a 14-inch grip (not suitcase), a general basket of moderate size, containing a stove, dishes, etc. Practically all of the piping and fittings described, like the plate under the little cooking table, can be obtained at any well stocked hardware store.

I could go on and tell you of more things I devised for comfort and convenience when fishing in the lakes of Minnesota, as a boat has more room than an automobile for luggage if you are to ride in comfort, and if you can't have room in the seat and room for your feet, no use going; but this is an automobile magazine and would not be germain to the subject.

Neither have I said anything about sleeping accommodation en route. The chairs I use, the table I have, my recent 2,000-mile auto trip—that is a longer story than this one, too much to be included at this time.

In conclusion, I want to say that there are many stock outfits on the market designed for the same purpose as mine. I believe I have investigated all that gave evidence of any merit. Some have many good points, but all had features that an actual experience taught me were utterly impractical, but a trial of many years has proven to me that my outfit answers every requirement of camping, outing, vacation or picnic, whether on a hill or solid ground or in the sand.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusable accident of a collision at a railway crossing.

In a few of the past issues of our magazine we have been running a department under the heading "Lessons for Drivers." At the suggestion of one of our readers we have ceased to look upon this department in the light in which we have heretofore seen it, and in the future intend to term it "A Life-Saving Department," for this is just what the Department is for. We want to bring home to our readers the many dangers which arise in the operation of an automobile. We intend to quote many actual instances of accidents, not in the spirit of criticism but to call attention to the different circumstances that make for danger.

Next Sunday morning, when you sit down to read the paper, count the number of accidents which you find reported, read them through and see how many of them could have been averted had you been in the place of the various drivers.

Careless Driving—Early this month, two innocent pedestrians were seriously injured when they were run down by a truck which had got beyond the control of the operator. The truck was running at a high rate of speed, and in turning a corner dashed from the road, through a pile of sand upon the sidewalk, hitting the men and then striking a post.

Driving on Left Side—An aged negro of Macon, Ga., was badly injured a short time ago, when he was struck by a taxicab, which was being operated on the left side of the street. The operator was arrested by the patrolman and arraigned on a charge of violating the rules of the road.

Roller Skates Cause Accidents—A lesson for parents as well as drivers is had in an accident which occurred near Memphis, Tennessee. A small boy who was on roller skates dashed from in back of a street car directly into the path of an automobile and had his skull fractured. The driver of the car, when he found he was unable to stop the heavy machine, tried to "straddle" the boy, so that the wheels would not run over his body, but was unsuccessful.

Ran Down Motor Cyclist—Last week at Salt Lake City, Utah, an automobile driven at a high rate of speed, in a reckless manner according to witnesses, ran into a motor cyclist who had stopped beside the road and was examining his machine. After having hit the man the driver of the automobile backed up his car to see what had happened, and hit the man a second time, crushing his ribs and fracturing his skull so that he survived but a short time.

Car Overturned—A big accident happened near Bridgeport on the first day of this month when a heavy automobile truck overturned at the top of a hill and seriously injured one passenger. According to reports the driver of the truck was startled by the sudden appearance of a heavy touring car on his left, and in trying to avoid the touring car, which cut in ahead of his own machine, the driver of the truck swerved to the right into a ditch and struck a stone wall. The driver and a second passenger of the truck were thrown clear of the wreck and escaped with minor injuries.

Reckless Driving—Ten soldiers from Camp Gordon, Georgia, were injured when a heavy motor truck operated at a high rate of speed ran into the ranks of the company.

Soldier Killed—A soldier was instantly killed and four occupants of an automobile narrowly escaped death in an automobile accident at the state highway near Beresford, California, when an automobile was overturned and entirely demolished. The machine was hit by a jitney containing nine soldiers, one of whom happened to be riding on the running board, and strange as it may seem, though the only person injured was the soldier riding on the running board of the jitney, the jitney was damaged but little.

Head-on Collision—Two drivers are today bemourning the fate of their automobiles which were entirely demolished near Houston, Texas, in a head-on collision. One of the drivers, despite the efforts of the police, cannot be located, while the other driver, who escaped without a scratch and was probably to blame, because he was driving on the wrong side of the street, is being held by the police.

Will Pay an Increase on Condition.

One of our subscribers, in replying to what we have been saying about an increase in our subscription rate, says: "I am even willing to pay $2.00 a year for The Automobile Dealer and Repairer if you will not discontinue the 'Lessons for Drivers.' I notice you omitted them in one or two numbers. I value the 'Lessons for Drivers' even more highly than the 'Trouble Department,' valuable as the latter is to most drivers. There is much to learn from these accounts of accidents. They make a careful driver even more careful. Do not discontinue this column. Rather give us more of them."

We have frequently been in doubt as to whether this department, "Lessons for Drivers," was appreciated or not. So occasionally, when crowded with material we have left it out. This protest is welcome because now we feel that this department should be maintained regularly.—Ed.

The Bouncing Bomb.

The elastic properties of rubber are being used by the Germans in their latest missile, the bouncing bomb. This curious device has a base of rubber so weighted that the bomb when thrown through the air strikes upon it. The impact causes it to leap into the air and also releases the time fuse. This fuse is so arranged that the bomb bursts when at the highest point—some six feet from the ground. Its destructive power is then much greater than if it exploded while on the ground.—Milestones.

Do you really enjoy your work, or are you constantly growling about its being the meanest business in the world? It is if you say so—to you, or you can glorify it and make it the finest thing under the blue canopy of heaven. Take your choice!

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK, APRIL, 1918.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in Australia and New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in Australia and New Zealand for obtaining new subscriptions.

WHO WILL HELP?

Every subscriber has one or more friends, who would be benefited greatly by reading The Automobile Dealer and Repairer regularly. We want to ask all our readers to make an effort to add one or more names to our subscription list. We are still offering The Automobile Dealer and Repairer to new subscribers only at the special rate of 15 months for $1.00, but this offer is not likely to be held open more than two or three months longer, because on the first of July the new and increased second-class postage rate goes into effect.

We would like, during the next two or three months to add two or three thousand new subscribers to our list, and if our readers will help us just a little, it can be done. Each reader knows how valuable our magazine has been to him, and can conscientiously recommend it to others.

NO TIME TO LOSE.

If you do not wish to pay more for The Automobile Dealer and Repairer than you have been paying, and more for all the other publications you are taking, you should write your Congressman and the two Senators from your State (if you have not already done so) at once, and insist that they vote for the repeal of the unjust and impracticable second-class postage law, passed at the last session of Congress. This law raises rates all the way from 100 to 800 or 900 per cent.

Readers located at places distant from the publishing centers are especially hard hit by this new law, as the rate ultimately to far distant points is to be ten cents a pound, instead of the present rate of one cent a pound. The publication with a subscription rate now of $1.00 a year to all parts of the United States will be obliged to raise the rate to all the Pacific Coast States and States west of the Mississippi River to $2.00 a year, and even then it will be no better off than at the old rate.

The new postage law goes into effect July 1st, so that there is no time to lose. Not only write yourself to your Congressman and Senator. but get as many of your friends as possible to do the same thing. Why should people living at far distant points from New York, for instance, be forced to pay more for their reading matter than people living within a radius of 300 miles? The publishers do not wish to charge any more; they desire to maintain what is called a flat rate; that is, the same subscription price to all parts of the United States.

Congress, however, takes a different view of the matter and insists upon penalizing people who live away from the big publishing centers. It is the most unfair law with respect to postage which has ever been put on the Statute Books. Don't think that your word will not count because you are only one. Every man or woman should feel that it is his duty to write to his Congressman and Senators and enter a strong protest against this unjust law. If enough people will do this, there is a strong likelihood that the bill may be repealed at this session of Congress.

As we have before explained in previous communications on this same subject, if you don't know the name of your Congressman, consult your Postmaster, and the same regarding the Senators. Address the Congressman, "House of Representatives, Washington, D. C.," and the Senators "Senate Chamber, Washington, D. C.," and do it while you are thinking about it or you may overlook it.

HE WAS FROM MISSOURI.

The publishers of a journal like The Automobile Dealer and Repairer come in contact through the mails with people of many minds, serious, aggressive, apologetic, humorous, etc. We often send to a prospective subscriber, in the hope of securing his subscription, seven letters before we decide that his case is hopeless, and abandon him to his fate. It is generally understood that a man from Missouri has to be shown, therefore it is not surprising that it took seven letters to convince Mr. C. O. Graham of Missouri, that he needed The Automobile Dealer and Repairer in his business and daily life. He capitulated after a while and this is the way he did it:

"Motor Vehicle Publishing Co.

"Gentlemen:—

"Your last, most persuasive, and quickly effective letter received recently. It is with a sense of shame that I admit a semi-criminal negligence in lack of response to your oft-repeated attempts to guard me against all accidents per the Auto-Route, also to inform me how to repair my machine and lastly, merely incidentally, to separate me from simeoleon, or in the Missouri vernacular, the iron dollar.

"I must admit that appearances are against me, but the truth of the matter is, I have read your paper, as much as I could, between doctoring one child for tonsilitis and another with pneumonia, milking 'bossy,' feeding the pigs, receiving car loads of feed, and seeds, billing and sacking same the next

Digitized by Google

day, and loading for different places of destination, also delivering feed of all kinds to my customers in a town of 3,000 inhabitants, these are only a few of the incidents that have conspired to prevent me taking advantage of numerous offers to help me out of auto troubles. But, now that this is the really last and final call, I arise to the occasion, putting all other and minor considerations in the background, and accept with all my heart."

INTERESTING TESTIMONIALS.

We are receiving constantly, letters from our subscribers, advising us that, if the new postage law goes into effect, we may raise our rates to $1.50 a year. Some of these letters are so particularly strong, and so very interesting that they are well worth reading. Here is what a new subscriber, who received his first magazine in December, says:

"I am a new subscriber, starting with the December number. If the new postal rates go into effect, I fail to see why you should hesitate about increasing the price. Surely, no one who has seen a copy of the Automobile Dealer and Repairer would hesitate to pay $1.50 or more for twelve numbers."

Another subscriber writes the following:

"Regarding your inquiry as to whether subscribers would object to a raise in the price of the Automobile Dealer and Repairer, would say that I will send $1.50 when my subscription expires, just as readily as I would $1.00."

A strong testimonial of value comes from the Nantz Auto Co., of Samson, Ala., who write:

"Your Automobile Dealer and Repairer is a self-cranker, to anyone who has an auto. I have been a reader of it for a long time. When my subscription expires, if you have to charge $1.50 for renewal, it will be cheap for the valuable information you supply. Five dollars wouldn't be any too much for it, for I gain something from it every month."

Here is what an Indianapolis reader writes:

"There is no good reason why your income should be reduced on account of this increase in postage, that you have no control over. I am a railroad man, and whenever wages are increased, the railroad companies always ask for increased freight rates, thereby shifting the burden to the consumer, where it belongs. It has always been the custom that when factories or mines, or in fact, any industries, have to pay large increases in wages or cost of raw material, the price of the finished product is raised accordingly and the consumer pays the bill. You are acting in the capacity of a factory, your product is a magazine, and your subscribers are the consumers. Now if you had a fair income before the war, it is far from adequate now, for everybody knows that wages have increased everywhere and raw materials have soared, so with the increased postal rates it must be imperative that the subscribers stand some of this added expense. I would suggest that the subscription rates be increased accordingly."

These are only four out of the many gratifying letters which we have received and the unanimity with which those who write express willingness to pay the increase, in case an advance should be necessary, is very gratifying.

One way to avoid the raise in rates is for our readers to write to their representatives in Congress and the two senators from their states insisting that the new law be repealed. As we have before pointed out, you can obtain the name of your representative, undoubtedly, from your postmaster, and the representative should be written to, House of Representatives, Washington, D. C. The two senators should be written to, The Senate Chamber, Washington, D. C.

We know that a great many of our readers have complied with our request, and we avail ourselves of this opportunity to thank them for so doing. We hope that all who have not done so will take the matter up and write promptly.

LEND—NOT SPEND—YOUR MONEY.

If you lend your money to the Government, you may be quite sure that it is going to be used for some national purpose—to prosecute the war successfully, to care for, equip, arm, and supply our soldiers in France, to be used by our Navy in ridding the seas of the murderous U-boats.

But if you spend your money, even with the belief that by putting it into the channels of trade others into whose hands it comes will lend it to the Government, you will have done something the patriotism of which may be very questionable.

First, you have withdrawn from the supply of material of the Nation something to replace which in the market will require labor and material which should be devoted to war purposes.

Second, the person to whom you pay your money may also use it to purchase things requiring material and labor which should be devoted to war purposes. And the person to whom he pays it may repeat the operation.

But when you lend your money to the Government instead of spending it, you will at once lessen the drain to a certain extent on our country's resources, its material, its labor, and its transportation facilities, and in addition you supply your Government with money to be used in winning the war.

Every purchase of a Liberty Loan Bond is an individual act toward bringing victory to America and her allies.

UNPATRIOTIC LEGISLATION.

What would seem, on the face of the matter, to be a gross miscarriage of legislation is had in a bill introduced by one of our New York senators in the State legislature, at the request of the State Highway Department. This bill is framed to deny the use of the New York State roads to army motor trucks and other five-ton trucks. The State Highway Department claims that during the last two or three months hundreds of new army trucks have passed on their way to France and that the roads have been badly damaged by this traffic. We should think that a department so well versed in road construction would realize the fact that slow-moving vehicles no matter how heavy do not have the destructive effects upon roads that light automobiles have. Why not prohibit the use of the roads to horses, teams, automobiles and pedestrians; for any sort of traffic is bound to have its effect?

We trust that the governor will veto this bill before it goes into effect should he be asked to sign it. Why should the State of New York or any other State in the union, for that matter, protest because of the slight expense brought about by the use of the roads for army trucks. Does France or England

Digitized by Google

or Italy raise a complaint because their roads are being destroyed? We can hardly understand why it is that a few men will choose to consider money above the lives of our boys on the other side. We feel that all of the resources of the State should be turned toward winning the war and that any legislation which hampers the work of the Government in any way should be discouraged heartily.

Should a bill of this sort pass, transportation facilities into or through New York State would be greatly congested, for the motor truck has done more to open traffic than any other factor outside of the railroads in the past six months.

WE WANT TO HEAR FROM THE NO'S AS WELL AS THE AYES.

We keep hearing all the time, we are glad to do so, from our subscribers who are willing to pay an advance of $1.50 or possibly $2.00 per year, if they are obliged to, because of the proposed increase in second-class postage.

Here is what one of our subscribers thinks about The Automobile Dealer and Repairer. He says, "I take several automobile papers, but find yours is always in the lead. I would subscribe for The Automobile Dealer and Repairer if you raised to $3.00 a year as it is well worth the money. I couldn't get along without it."

We want to hear not only from those who are willing to pay the increase, but particularly from those who do not wish to pay the increase, and there must be some of our subscribers who feel that way about it.

Now all you people who object to paying an increase of 50 cents a year to $1.50 and would stop your subscription if this increase is made, please stand up and vote on this question.

Send just a postal card if you do not want to send a letter and tell us what you think about it.

We wish to impress upon our readers that we do not want to raise our rates if we can help it, but we have no control over conditions. It is well known that everything, almost, has increased in price. Why shouldn't the subscription rates of magazines increase a little at least.

Write us at once and then you won't forget about it.

STANDING THIRD ON THE LIST OF INDUSTRIES.

According to Chas. Francis, one of the most prominent printers in New York City and in the whole country, the printing industry ranks third in the United States in importance. Mr. Francis takes into account, in his estimate, the allied industries of printing, such as paper making, binding, lithographing, etc. This would seem to be fair because without printing there would be no necessity for paper or for electrotyping or binding.

And yet, Congress last fall, at the behest of one man, incorporated in the war tax bill a clause which, unless it is repealed or modified greatly, will result in crippling and probably destroying a considerable part of the great printing industry of the country. It would seem as if Congress might be employed in better business than ruining the industries of the country.

Publishers who are driven out of business, as numbers of them will be by the second-class zone postage law, cannot help pay war taxes. An industry that is destroyed cannot assist in winning the war.

Our readers, of course, are already familiar with the conditions of the new second-class rate which will go into effect July 1st, and those of them who have not already sent their protests to their representatives in Washington and to their senators, we hope will do so at once.

DISCONTINUANCE OF TECHNICAL SCHOOL.

With a great deal of sorrow we announce the closing of the Technical School which for the past 38 years has been located in this city. This school was started in 1880 by the carriage builders' interests for the purpose of training young men in mechanical drawing as well as instructing them in the theory of carriage building. Two years ago the carriage builder interests decided that the school should be maintained by the automobile manufacturers, and the suggestion was favorably received by the automobile interests, as well as the Automobile Chamber of Commerce of New York. For some reason or other the automobile interests have ceased to contribute toward this worthy enterprise, and though the rooms, heat and light are furnished by the Mechanics Institute, the manufacturers did not care to put any more money into the Technical School treasury.

Many of the young men who have been trained in this school occupy big positions in various automobile body and automobile manufacturing plants, and we do not doubt but that the discontinuance of this school will shortly result in a lack of trained body designers.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

2400 Alternating and Direct Current.

From E. Teska, Wisconsin.—How can I find out the difference between a direct-current generator and alternating current which I am using for lighting my garage? It is rated at 115 volts, 9 kilo., and I would like to use it for charging storage batteries.

Reply.—If you will look at the armature, or the revolving member, you will see on one end a device called the commutator, the device through which the current from the armature windings passes to the collecting brushes. If the machine is a direct-current generator, the commutator will be composed of a number of segments, insulated from each other, and extending lengthwise or in a line with

Digitized by Google

the armature shaft. If the machine is an alternating-current generator, the collecting arrangement will be in the shape of a number of rings, around the shaft.

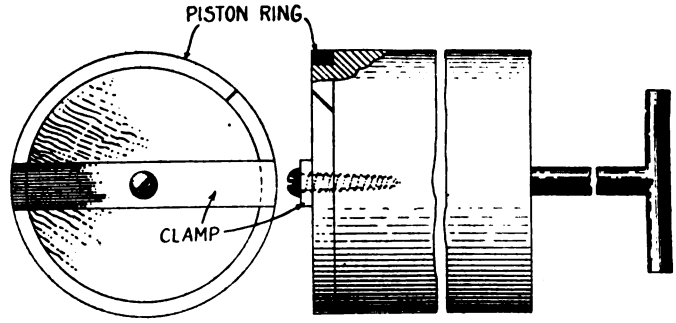
2401 **Carburetor Trouble.**

From S. P. Leonard, North Carolina.—I have a 1914 model Ford car and have been having trouble with the carburetor, of late. In the first place it is hard to start on the magneto; batteries do not help any, and after it is started, it will miss at times. I have tried all kinds of adjustments and get no better results. I have overhauled the motor completely recently, and installed new valves with oversize stems and new piston rings, but it did not help my trouble any. The ignition system is in good condition. I installed a pet cock in the intake manifold and when I open this the motor runs perfectly without a miss, and pulls like a young mule, but opening the pet cock does not help the starting in any way. The carburetor in question is a new Holley, put on about three months ago. The motor acted the same before I put on the new carburetor. Why does a motor pump oil after the engine is cleaned and the valves ground? This engine did not pump oil before I did the work on it, and since, the third cylinder has been pumping oil, I have taken the head off and examined the valves thinking that the valves of that cylinder were held off their seat through some cause or other, but could not find anything the matter with them. The piston is a good fit in the cylinder and I have put in new rings and beveled the upper edge of the bottom ring, but it still pumps oil when the motor is firing on all cylinders.

Reply.—In answer to your letter relative to trouble with the 1914 Ford car, undoubtedly all of your trouble is caused by the present low grade of gasoline. This subject is discussed in an article which appeared on page 73 of the March Automobile Dealer and Repairer.

For starting your car you might try the application of heat to the manifold. There are a great number of electrical devices on the market for accomplishing this, though the writer has used a hot flat iron, hot bag of sand, an electric flat unit and boiling water.

Your idea of opening the pet cock in the manifold is good and you will find that one of our readers questioned us regarding its installation in our March number. The pumping of oil is also discussed on Page 73 of the March number. In fact, this article entitled "Difficulties Encountered in the Use of Present Day Gasoline and Heavy Fuels" is a direct answer to your letter.



2402 **Oil Leakage.**

From E. C. Wisser, West Virginia.—My Dodge has been leaking oil past the cylinder rings. I have decided to put two new rings in each cylinder. Will you kindly give me some idea about the job?

Reply.—We would advise you to install a set of leak-proof rings rather than the plain butt-jointed rings, but before doing this be very sure that the cylinders are round and that there are no scores or scratches in them. Should you finally decide to fit the plain butt-jointed rings in the cylinders the following directions should be followed very carefully.

First, see that the rings fit the piston ring grooves without binding on the sides. Be sure that the grooves are thoroughly cleaned before trying to fit the rings, and should the rings be too wide, work them down with fine sand paper on a flat board. When the rings have been fitted to the grooves prepare a "dummy" piston from a block of wood with a good clamp at the top, as shown in our sketch. Place the ring to be fitted in this clamp and slide the ring into the cylinder.

You may find that the ring is too large to go into the cylinder, and if so, file down the ends so that it can be slipped in leaving about .001 of an inch between the ends. Coat the inside of the cylinder with Prussian blue and slide the ring up and down

"Dummy" Piston for Fitting Piston Rings Into Cylinders.

once or twice in the cylinder. When the ring is removed you will find that the blue has been scraped on at a number of points indicating high places. Scrape these places off with fine emery cloth and repeat the operation until the ring contacts its full circumference of the cylinder. Then snap the ring on to the piston and fit the next ring. After you have fitted a ring to a cylinder, be sure to use that particular ring in that cylinder. Do not transpose it to another cylinder.

2403 **Top Refinishing Liquid.**

From S. Elferman, Iowa.—Can you tell me of any liquid that I can use on the top of my 1915 Dodge Bros. car, which is fitted with a cravanetted top, that will refinish and darken it, as well as make it water proof?

Reply.—Editorial policy will not permit us to recommend any particular product and we would suggest that you consult the nearest dealer in automobile accessories, or possibly your Dodge agent may be able to give you just what you are looking for.

2404 **Speed as Related to Power.**

From C. F. Bayley, Vermont.—I would like your opinion on the following question. I have a 1916 Metz friction drive car and it suits me nicely, except it is a little slow on hills. On the level, however, it runs fast enough. At present it has 32-inch wheels fitted with full-studded Woodworth treads, making them 33 inches in diameter. How much faster could I take hills on a 30-inch wheel, than I do with the 32-inch outfit. My car has run 3,000 miles and I have never seen the inner tubes. Woodworth treads are all right.

Reply.—The question of speed comes down entirely to engine power. The substitution of 30-inch wheels for the present 32-inch wheel equipment might result in a slight increase of pulling power, but possibly a decrease in actual speed. To increase the speed of the car above a certain limit you would need a larger engine. If you are looking for more

Digitized by Google

speed and find that you can surmount hills on high at present with a little difficulty you may equip the car with larger diameter wheels. This would mean that hills which you surmount on the 32-inch wheels you might not be able to surmount on the larger sizes. Smaller wheel equipment as you suggest would mean that you could get up safely hills on high but on level going with an engine running at highest speed the car speed would be cut down. The rule which you can follow in all of these cases is that increased speed means less power and decreased speed means more power, the engine equipment being the same.

2405 **Eight Short Questions.**

From David H. Cressman, Pennsylvania.—Will you kindly answer the following questions at your convenience: 1—I have a 1917 sensible six Oakland auto. Would it be advantageous to instal a small tank to carry gasoline for starting and then carry half and half gas and coal oil to run the car with? Would there be any ill effects to engine and would it be saving enough to pay to make the change? 2—In installing a spotlight where is the place to connect it? 3—Can you give me a pointer to take out a dent in gas tank in rear? 4—If storage battery is testing about 1200 will it become stronger again if car is run and the lights not used? 5—What are causes for storage batteries running down in short time and what is the reason of the water working out on the top? 6—I have a 1915 Ford with G. & D. starter and Willard battery. Do they recommend a special make battery for this starter? 7—Will battery charge and become stronger if car is run and the lights not used? The whole light system, front, side, rear and dash lights are connected together, also horn. I am told the storage battery is only for starting the engine, and so that I can have lights when the engine is not running. Is this so? Will a 31 by 3½-inch tube fit a 32 by 4-inch casing?

Reply.—It is hard to say just whether your engine will run on a mixture of half gasoline and half oil. We doubt very much if you will be able to use this mixture for two reasons. You will be unable to heat the mixture hot enough to get the maximum power, and providing the engine runs, you will be constantly troubled by the formation of carbon in the cylinders. If you can obtain a combination manifold for this engine and buy a water vapor attachment, you may be able to use the half and half mixture. Before installing such a tank we should advise you to make a number of experiments.

Your spot light may be connected in either of two ways. You may connect both terminals of the spot light to the two storage battery connections or you may ground one terminal of the spot light and connect the other wire with the wire which leads from the current indicator to the back of the switchboard. For taking out the dent in the gas tank you may solder a brass rod to the deepest portion of the dent and work the dent out by pulling on the rod.

Under ordinary conditions the storage battery may be charged if the car is run and the lights not used, being careful not to draw on the storage battery for starting current. If your battery now tests about 1200, we would advise you to take it to a storage battery expert, for there is evidently some trouble with the battery itself. If the water works out on the top of the battery very much it is probably an indication that the battery is too full of water, and is sure to be one of the reasons why it discharges so quickly. You had better see a storage battery expert about this and he will give you full directions. Practically any of the popular makes of storage batteries will work well with the Gray & Davis-Ford starting and lighting system.

The Gray & Davis system is intended to furnish all the lighting current and current for the starting system. There should be no difference in the steadiness of the lighter whether the engine is running or not, and if the lights flicker or do not burn steadily, there may be trouble with the connections or with the current regulator. Without further details we cannot answer this more completely.

It will not be wise to use a 31 by 3½-inch tube in a 32 by 4 casing, for the tube will be stretched too greatly. By doing this the tube mileage will be cut probably more than 50%.

2406 **Ford Headlights.**

From S. H. Puffenberger, Maryland.—As a reader of your paper I desire a little information and advice from you.

I have a 1914 Ford that had originally an acetylene lamp equipment. About two years ago, I installed electric lights, wiring them in series as on the later Ford cars, and using six-volt, 12-candle power light bulbs. The lights were as satisfactory as installed generally on Fords, but did not give good illumination when the engine was running at low speeds. Some people obtain better results by wiring the lights in parallel or multiple and so I tried this scheme, but as soon as the light switch is put "ON," the engine misses fire and operates poorly, sometimes stopping altogether. What would you suggest as the trouble? Do you think that there is a leakage of current at any point, or is this old style magneto insufficient for ignition and lighting purposes?

Reply.—The early Ford magneto for those machines built up to the year 1915 was designed primarily for ignition purposes only and did not give sufficient current for lighting. Due to the ever increasing demand for electric lights the Ford Motor Company finally put lights on as regular equipment, realizing all the time that they would never give complete satisfaction because of the lack of current. At first the magneto would work fairly well, but as time went on the strength gradually decreased until the lights would not give much illumination.

As long as the two lights are wired in series their combined resistance prevents the passage of too much current through them and so the ignition system operates. As soon as the lights are arranged in parallel, the total resistance is cut in half and naturally the ignition system does not receive enough current to operate it.

We doubt if your magneto will ever give satisfaction when used both as an ignition source and as a source of current for lights, and we would advise you to install a storage battery or an auxiliary lighting system.

2407 **Charging Storage Batteries.**

From T.H. Parker, California.—I have constructed a rectifier for charging storage batteries as directed

Digitized by Google

in the Automobile Dealer and Repairer though I do not know yet how it works. I note that the directions advise the placing of the plates an inch or more apart; would it not be better to place the plates nearer together than an inch?

I have an electric generator with shunt wound fields, controlled by a field rheostat. The voltage ranges from zero to 150 and the amperage output is nine. I would like to charge one or more storage batteries from it. How could I control the current by this field rheostate or should I use a rheostat in the line? The storage battery indicates a charging rate of a certain number of amperes, but nothing is said of the voltage. Would 110 volts damage the battery?

Reply.—We would not advise you to put the plates any nearer together than Mr. Leurs recommends, for if we are not mistaken a certain amount of internal resistance is necessary in order for the rectifier to work properly.

Your second question relative to the shunt wound generator, which you have, is not quite clear. If you can control the amperage in any way through a regulator device on the machine itself, you will not need a special rheostat in the main line. The voltage of a line makes absolutely no difference in charging your storage batteries. The amperage is the controlling factor and we would advise you to connect storage batteries in series for charging, utilizing the full voltage not to exceed 110 and controlling the amperage by suitable rheostat or like resistance in the charging line.

2408 **Camshaft End Play.**

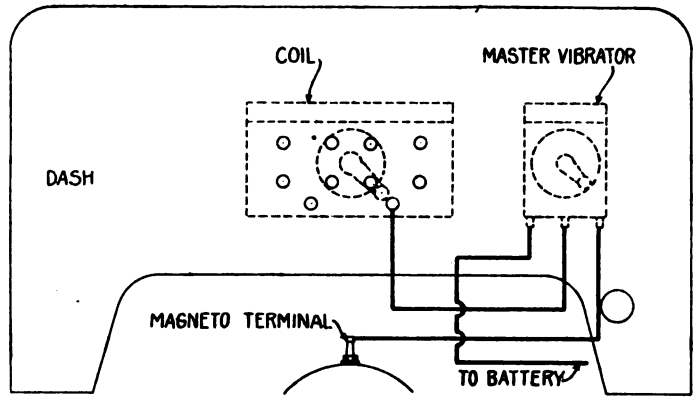
From H. D. Brice, Illinois.—I have just taken down a four-cylinder Continental engine, Model N, which was used on a Moon, Model 4-38 car. Late last season a peculiar noise developed which seemed to be in the timing gears. I found everything apparently all right upon inspection, with no visible signs of wear. The camshaft has a hardened button with a spring in back of it, on the end, and this button bears against the timing gear case cover. I think that this spring may have weakened, or else the button sticks. What do you think?

Reply.—If the cam shaft in this engine has a tendency to move backwards or forwards, or has what is termed "end play" the trouble is probably due to the fact that the spring beneath the hardened steel button at the end of the shaft has been weakened or assumed a permanent set position.

We would suggest that you remove the button and put in a new spring and button, which should remedy the trouble.

Practically the only thing that retains the cam shaft in position is this steel button and hard bearing surface on the timing gear cover. You might make a careful examination of the camshaft bearings and be sure that they fit the shaft tightly, for should they be too loose they will have the tendency to increase the end play.

2409 **Timing of Velie.**



From Edward Nuetzel, Illinois.—Will you please let me know how to time the spark mechanism on a Velie 1916 Model 22, equipped with a Continental engine 7W and Remy Battery ignition system? What I would like to know is the position of piston number one, when the circuit breaker points begin to separate?

Reply.—This machine is fitted with automatic spark advance mechanism. When the piston in No. 1 cylinder is at dead top center of the firing stroke the breaker points should begin to separate. The advance will be taken care of in the advance mechanism.

2410 **Noisy Transmission.**

From Fred Kegel, Ohio.—I have a 1916 Ford which, when running at 20 or more miles per hour makes a humming noise which seems to come from the transmission. The noise has developed within the last 200 miles. Can you tell me what causes this? Does a Ford need oversize piston rings after running 9,000 miles? Do patent piston rings need fitting like the ordinary rings? Would you advise using a master vibrator on a Ford? Is there a way of wiring a master vibrator so that the electric head lights can be used?

Reply.—The humming noise which seems to come from the transmission of your Ford car is probably located in the rear axle and carried along through the drive shaft to the transmission. The indications are that the master and beveled driving gear do not mesh properly. This whole matter is taken up in the March issue of the Automobile Dealer and Repairer in an article by Mr. Luers.

Wiring of Master Vibrator When Used With Head Light Circuit.

There is no way of telling just when the engine needs over-size piston rings. It depends upon the engine and the usage which it has received. Only an expert mechanic on metal can give you proper advice.

We would not advise the installation of a new set unless you obtained proper advice from a machinist who has seen the cylinders.

We give herewith wiring diagram of a Ford car with master vibrator equipment.

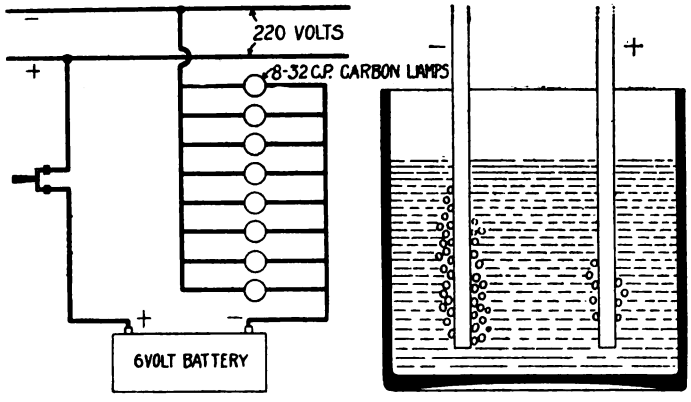
The so-called patent piston rings must be fitted into piston grooves and will fit the cylinders if the cylinders are absolutely round. This is the only fitting required.

2411 **A Question of Candle Power.**

From Emil R. Miller, South Dakota.—I will be greatly obliged to you if you will answer the following questions by mail. What is the difference between a nine volt 15 c. p. and a nine volt 25 c. p. bulb? Which will give the most light on a Ford magneto? Which uses the most electricity if there is any difference? Can I purchase a ready made

Digitized by Google

rectifier for storing a battery from a Ford magneto, such as mentioned on page 39 of the January Dealer and Repairer? Where can I get a pure aluminum plate? How should the electrolyte be mixed?



Reply.—The difference between a nine volt 15 c. p. and a nine volt 25 c. p. is that the larger light takes the most current. A 25 c. p. light consumes slightly more than 50% more current than a 15 c. p. Of course a 25 c. p. bulb will give the most light on a Ford magneto at high engine speed. When the engine is running below normal there will be little difference in the amount of light.

We do not know of any manufacturers making a rectifier for storing a battery from a Ford magneto. You should be able to buy pure aluminum plates from a brass foundry or from some wholesale mechanical supply house. The electrolyte solution should be obtained from a druggist if you intend to use the neutral ammonium phosphate. If you intend to use sodium bicarbonate solution, however, you can mix it yourself. Dissolve as much cooking soda, which is the commercial name for sodium bicarbonate, in water as the water will absorb. Let it stand over night and strain it through a cloth.

2412 **Charging Storage Battery.**

From Frank J. Nagel, Minnesota.—Will you kindly answer the following questions by letter?

1—Give wiring diagram for charging Willard storage battery, 6 volt, 80 ampere hours on a 220 volt, direct current circuit. 2—Why does a 32 c. p. carbon filament, 110 volt, use 1 ampere and a 32 c. p. 220 volt only ½ ampere? 3—Which consumes the more current, charging a battery with 8 32 c. p. 220 volt lamps, or 1 32 c. p. carton filament lamp burning direct, say for six hours? Give example. 4—How can I find the positive of the line wires? 5—Which wire should lead through the lamps, positive or negative? 6—How can

Charging a Six Volt Battery and Illustrating Method for Finding Polarity of Lead Wires.

you vary the amperage while charging this 6 volt 80 hour ampere battery? 7—Is this battery charged at 220 volt rate? 8—Will battery run down if allowed to connect to the line after power plant shuts down? 9—How can you tell the difference between a sulphated or short circuited cell? 10—What harm is done by taking electrolyte from one cell and putting into another?

Reply.—We are enclosing herewith a wiring diagram for charging a six volt storage battery of 80 ampere hour capacity from a 220 volt current line.

You will notice that the positive wire of the line is connected from a switch with the positive battery terminal; the negative battery terminal being connected with one side of a bank of 8 32 c. p. 220 volt lamps. The other side of this bank is connected with the negative line wire. It makes little or no difference which line leads through the bank of lights, but as a general rule the bank is connected with the negative side of the circuit. The eight lamps will allow four amperes of current to pass into the battery. This amount of current you will note, is the finishing rate marked on the battery and is the rate to use. The positive and negative line wires may be found by dipping them in a solution of salt and water. If they are held about half an inch apart you will notice a great number of bubbles rising from one of the wires. This is negative. The positive wire will have very few bubbles in comparison. If during the charging all of the lights go out indicating a secession of the charging current, the switch should be opened immediately, or the battery will be apt to discharge through the line.

A 32 c. p. carbon filament lamp consumes slightly more than 100 watts and since a watt is the product of the voltage times the amperage, a 32 c. p. lamp burns about one ampere of current at 110 volts. By the same rule a 32 c. p. 220 volt lamp only consumes about half an ampere. Electrical current is usually measured by watts so that you can see that approximately 110 watts are consumed in the different instances, bringing the cost to approximately the same figure for the same c. p. lights on the two currents.

Eight 32 c. p. 220 volt lamps when used in charging the storage battery use up about 880 watts, while one 32 c. p. light of the same voltage only burns one-eighth as much current. If it should take eight hours to charge your battery, using the eight lamps as resistance, you would consume considerably more than eight times as much current as you would simply by burning one light, because you would be using up approximately four amperes or 880 watts for charging the storage battery.

We doubt if you will find it economical to use this voltage for charging one battery, for you will be obliged to put in so many lamps that you will waste considerable current in the lamps themselves. The amperage passing through the battery may be varied by the addition or the removal of lamps. With the addition or removal of each lamp you add or remove half of an ampere. A cell sulphated naturally by normal current use, usually remains in good condition for a long time, while one which is sulphated by short circuit depreciates very rapidly. Practically the only way that you can find out whether a cell has been short-circuited or not is to remove the cover and examine the plates. If they are badly warped or the active material has been separated from the grids, it is an indication of over-usage or short-circuit.

Electrolyte should not be transferred from one cell to another for the very reason that the specific gravity of all the cells should always be kept alike and the electrolyte level in all the cells should always be approximately the same. Should you remove the electrolyte from one cell and put in another, the level in the first cell is lowered slightly, and to bring it back you would probably add distilled water. This of course will dilute the electrolyte and the specific gravity will be lowered.

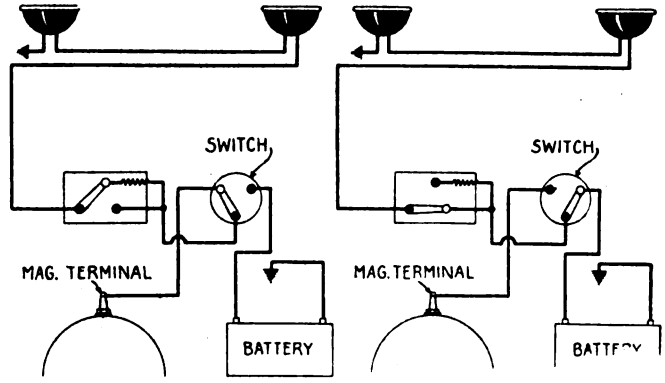
3 **A Tractor Question.**

'rom F. J. Hund, Kansas.—I am thinking of inting a 20 h. p. auto engine on a light tractor ne geared from 2 to 3 miles per hour. Will it i the engine to put it at hard work like plowing? v many gallons of water should the radiator hold keep from over-heating? Will that size engine two 12-inch plows? Would I be going against law to put an auto engine on a tractor frame buy it? I know this is not in the auto line but information you can give me on this subject be appreciated. Also if I am not asking too ch would you advise to buy a used car if engine good compression and pulls good? Would you ise me to put a 1918 body on a 1909 car?

eply.—We see no reason why you cannot use a h. p. automobile engine in a light tractor frame red from two to three miles per hour, for many he light tractors now in use are fitted with en- es very similar to those used on automobiles. i may be able to use the present radiator by ing an auxiliary tank at the side which should d about as much water as the present radiator ds, giving a capacity of about double that used automobile work. The engine should easily pull 12-inch plows.



As you did not say what engine you intend to use, cannot say definitely that you would not be ng against the law. If the engine is one of the ular makes, we doubt if the manufacturers care the least whether you use the engine for auto- bile work, for marine work, or for tractor work. Your last question is very difficult to answer. e amount of compression in an engine is only one he general indications of efficiency. The engine ght be worn out in every other particular but e a new set of rings and a new cylinder plug. e rest of the car might be in poor condition. The nsmission might be fully gone and the rear axle irely worn out. The writer has often seen en- s which had very poor compression temporarily aired by the addition of graphite to the cylinders. h this repair the engine would run sometimes a week, without showing any loss of compres- n.

We would not advise you to put a 1918 body on a 9 car, for we feel that it would be cheaper for to buy a used car of more recent date.

---

4 **Wiring Ford Car.**

'rom R. G. Kimball, New Hampshire.—I have a d with Atwater Kent ignition. I run head and lights on magneto. I would like to hook up my nts on batteries also, to enable me to have lights en car is standing. Would you advise sidelights two bulk tail lights and how would you wire same and what candle power bulbs would you use enable a small amount of current to be used from teries. Would it be possible to insert small bulbs neadlights and have a good looking job. I believe eflector has been made for this purpose. Could give me information as to where to obtain it? With my Atwater Kent system I am usually able shoot a spark into one cylinder with the snap ton on coil. After my engine is warmed up I usually start my engine in this way by allow- a charge of gas to be sucked in upon stopping. have thought that by the aid of a primer I ght have success in starting my engine with a snap spark after it has been standing some time. The fact that the gas injected by a primer would not reach the cylinder that was on firing owing to the fact that the corresponding intake valve would be closed I am at a standstill to know whether or

Wiring Ford Headlights for Dimming. At Left, Dim From Magneto; At Right, Full on From Battery.

not it would be advisable for me to put in four pet cocks in cylinder head and connect a primer to these.

The difficulty would be, how could I install same and be enabled to open and close pet cock and inject gas from the seat. Could you give me the desired information if you think the scheme advisable and worth while?

Don't think that I am too lazy to crank my car. I simply have a hobby of trying to see what can be done by exerting a little effort.

Reply.—We would advise you to use headlight bulbs of about 15 c. p. and rather than install two sets of bulbs, one for greater illumination and the other for lighting the car while standing, we would advise you to put in some sort of a resistance coil, as shown in the diagram, or possibly wire the lights so that they can be run in series while the car is standing, and parallel at other times.

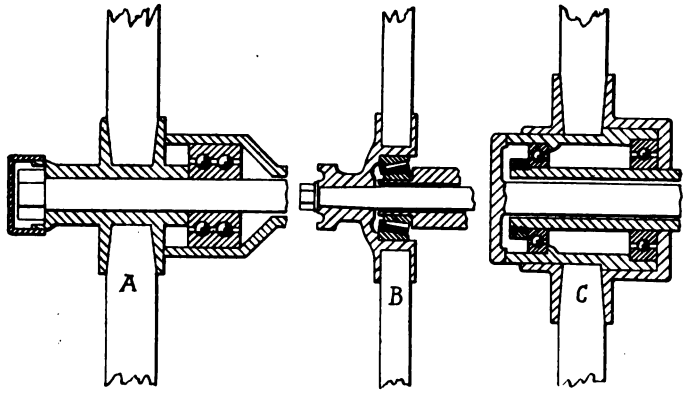
We do not know of any reflector which you can obtain for a Ford car light, that has provision made for two bulbs. We would not advise you to install a primer such as you suggest for starting the engine by the snap switch method, for you could never be sure of results. The pressure required would be in the neighborhood of fifty pounds and even if you were able to install a pet cock arrangement in the cylinders, you would always be troubled by pump leakage and other items of this sort. Such an installation would cost you about two dollars for the pet cocks, about one dollar for the tubing, and from three to five dollars for a suitable priming pump. For this figure you should be able to obtain a mechanical starting device or possibly a second-hand electrical starting motor.

2415 **Buick Timing.**

From Wm. F. McMaster, New Hampshire.—I have a neighbor who bought a Buick 40, a good second hand car. The trouble with it is the valves are not set right. He had me look at it and I find it firing 4-2-1-3. On the fly wheel is a mark D. C. 1 and 4 one inch and a quarter; to the left of that mark from the way the fly wheel turns is another mark and the same distance from this mark is a third. Now, I took off the front gear plate, turned the fly wheel until the first mark by D. C. 1—4 was centered on the crank case, disconnected the gear

Digitized by Google

and turned the cam shaft until the exhaust valve closed of No. 4 and this does not seem to give results. Would you please give me the instructions—where I might get these valves right. I would also like a little information about my car which is an old one. All the bearings are roller and I find that the raceway that holds the bearing called the pinion shaft is worn quite badly so much so that there must be a crowding off effect on the pinion as I have broken two pinions this past summer and when I break one it means a new shaft as well. My car is an R. C. H.



Reply.—The exhaust valve on this car should close before the piston has reached the top center. Turn the crankshaft over until the fly wheel mark D. C. 1—4 is underneath the indicator, then turn it backward for about one and one-quarter inches. The mark on the fly wheel which is before the mark D. C. 1—4, should now be beneath the marker.

At this point, the exhaust valve in either cylinder one or four should close. Turn the camshaft until the exhaust valve in either one or four cylinder just closes, and mesh the gears.

In your R. C. H. car we should advise you to buy a new sleeve for the pinion shaft roller bearing This you may obtain from any of the following concerns: R. C. H. Corporation, Detroit, Mich.; Puritan Machine Co., Detroit, Mich.; Auto Gear & Tire Co., Chicago, Ill.; Pacific Motor Car Exchange Co., 221 West 53d St., New York City, N. Y.

2416 **Types of Axles.**

From Philip Harrington, Rhode Island.—Will you please tell me the difference between semi, three-quarter, and full floating axles?

Three Types of Axles. A, Semi-Floating; B, Three-Quarter Floating; C, Full Floating.

Reply.—At A is illustrated a semi-floating axle. In this type, all of the weight of the car rests on the axle, to which the wheel is applied. The bearing in the housing carries the weight. At B is illustrated a ¾ floating axle. In this case, practically all of the car weight rests upon the wheel itself, and the axle carries but little. In the full floating type, shown at C, all of the car weight is carried on the bearings and housing and none on the axle; the axle therefore floats, and is utilized simply for transmitting the power to the wheel.

2417 **Cleaning a Water Tank.**

From Ernest L. Silver, New Hampshire.—I have in disuse a galvanized iron tank formerly used for heating water. There is doubtless some rust and scale inside. Could it be used for storage of gasoline without danger of rendering the gasoline unfit for use in an automobile?

Reply.—There is no reason why you should not use the galvanized iron tank, formerly used for heating water, for gasoline storage—provided you give it a good cleaning with, possibly, hot water and applications of kerosene oil, the latter especially. It would be a good idea to strain all of the gasoline coming from the tank for the first few months at least.

2418 **Light Bulbs Burn Out.**

From H. V. Kern, Minnesota.—I have had quite a little trouble by the blowing out of the light bulbs on my car and would like to know what causes this. They always flicker and on low or second they blow out every time.

Reply.—From your letter, it would seem that your car might be a Ford, and if it is, the trouble can only be remedied by the installation of two higher voltage bulbs. When the engine is running at ordinary speed the magneto generates from fourteen to eighteen volts, but as it speeds up the voltage increases, and you can plainly see that if the car is fitted with two front lights of nine volts each, they will burn out under higher voltages. When you put in the low speed to keep the car going, you run the engine faster than normal, and so the voltage increases.

Perhaps the magneto of your car generates slightly more than the average current, but in any event higher voltage bulbs will prevent them from being burned out.

If your car is not a Ford, let us know, and we will advise you further. If it is fitted with a storage battery you should not have the trouble that you do. In case the car is fitted with a generator and a storage battery for lighting, you might have a repairman examine the generator cut-out, for this is probably where your trouble lies.

2419 **Timing Remy Unit.**

From Orvis J. Haven, Massachusetts.—I have an Oakland Six Cylinder Model 32, equipped with the Remy electrical outfit No. 166. I have taken the generator off for repairs and do not see any way to put it back and have the engine fire correctly. There do not seem to be any gears marked, and I do not believe they could be put in even if there were, as one can't see when they go together. Does the timer or distributor have to be loosened up and turned around to get the right time after the gears are put in mesh? If you could send me some sketch so as to help me, I would be very glad.

Reply.—The Remy generator should first be placed upon the car in its correct manner and the gears meshed. It should be carefully bolted down and tightened into place, etc. After this has been done, turn the engine over with the hand crank until the piston in No. 1 cylinder is about one-quarter inch from the top of its compression stroke. Connect the spark lever mechanism to the distributor and advance the spark as far as possible. Remove the distributor cover and lift off the distributor brush. This will expose the breaker box cam, which is retained by a small nut. Unscrew the nut and pull the cam from the shaft. This last operation is rather difficult without proper tools, but you may be able to borrow a cam puller from a nearby

Digitized by Google

garage. When the cam has loosened turn it with your fingers in its direction of normal rotation until the breaker points begin to separate. Clamp the cam down with the adjusting nut, replace the distributor brush and note whether the brush comes directly under the wire leading to No. 1 cylinder in the distributor box. If it does not, you will be obliged to remove the brush and cam as before and turn it until the points again begin to separate and the brush is directly beneath No. 1 distributor terminal.

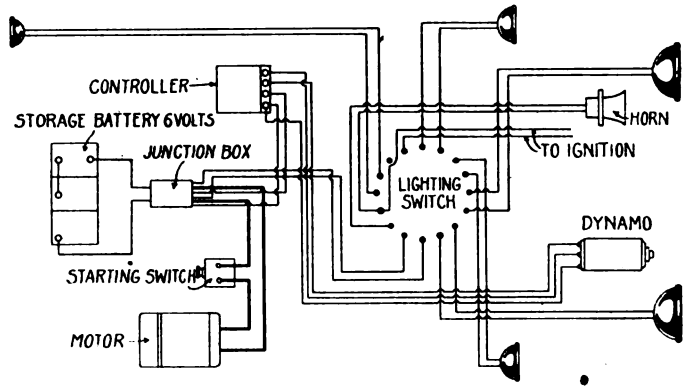
When its correct setting has been found, you may put the cam into place and tighten the nut. Verify the setting by trying out one or two of the other cylinders. With the spark fully advanced the breaker points should separate about one-quarter inch before the piston has reached top center of the compression stroke.

2420 Relining Maxwell Clutch.

From Robert C. Grote, Ohio.—I have a 1917 Maxwell car and would like to know the easiest way to renew the clutch lining. The differential makes a loud grinding noise when it is run in high gear between speeds of 25 and 28 miles per hour. At speeds above 28 and below 25, however, it does not bother at all. How can I correct this? The car is equipped with a Simms Huff single unit starter and generator. How can I increase the charging rate?

Reply.—To reline the clutch in your 1917 Maxwell car, you will first be obliged to disconnect the universal joint at the rear of the transmission. Then after having removed all of the control rods, levers, etc., from the transmission, disconnect the transmission housing from the bell housing on the engine, and draw the gearset backward and away from the engine. With the gearset out of the way, the clutch will be exposed and you will find that there are three nuts retaining the clutch springs. Remove these three nuts, take off the three clutch springs, and the cone can be taken from the fly-wheel. A new clutch fabric may be obtained from the Maxwell agent or factory, together with new rivets. In replacing rivets be sure that the heads are driven below the surface of the fabric or you will have trouble.

The differential trouble is probably caused by a wrong adjustment in the gears, and there is no way in which you can remedy this, for it is essential that in this particular outfit the adjustment be made by one who is fully experienced. You will probably be obliged to have a new collar put on in back of the pinion gear.



The makers of the Simms-Huff systems do not recommend the changing of the charging current, for they claim that if the generator is changed in any way they will not be responsible for the equipment after the change has been made. Although the writer has had considerable experience in electrical installations, he has never changed the charging rate of the Simms-Huff or Remy machines, preferring rather to take the matter up with the manufacturers or the agents, for in that way only can one be sure of satisfaction.

2421 Henderson Wiring Diagram.

From J. Edward Paterson, Illinois.—Will you kindly forward me the wiring diagram of the Ward-Leonard Starting and Lighting System used on the 1914 Henderson car?

Reply.—We give herewith wiring diagram covering the Henderson 1914 car which was fitted with a Ward-Leonard starting and lighting system, and trust that it is the diagram which you require.

Many of the older cars have been fitted with lighter type switches or other units which make

Wiring Diagram of Henderson Car.

slight changes in the wiring and should you find that this wiring diagram does not fit your car, you might send us a sketch of the various units together with the location of the binding post and all markings, and from this data we may be able to supply you with further information.

2422 Uneven Engine Operation.

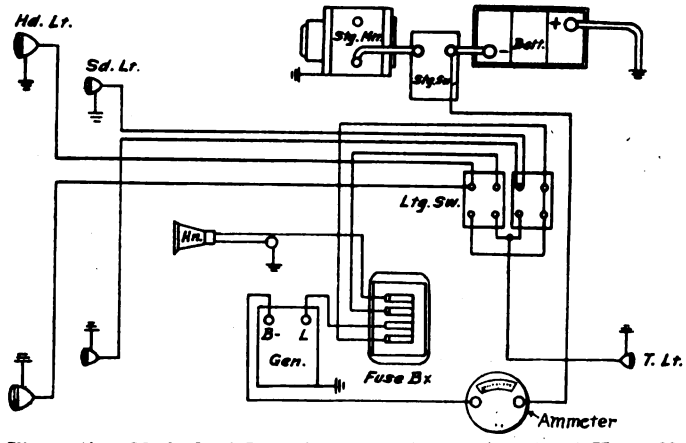
From J. W. Scott, Michigan.—Can you give me some suggestions as to the possible trouble with my engine, and how the trouble may be remedied? Number four cylinder in my Model 83 (1916) Overland became scored last winter, through failure of lubrication, I had this cylinder rebored and an oversized piston installed. The shop which did this work makes a specialty of reboring, and is considered very reliable. They assured me that the scoring was not bad and that not over ten-thousandths of an inch was cut away. They claim that they are doing this right along without any trouble and, in fact, showed me an engine on their floor which they had bored one-sixteenth of an inch larger.

After this repair, I put the car up for the winter. A few days ago I turned it over to the service station to have the engine tuned up. They removed the carbon, reseated the valves, and in fact went over the valves in cylinder four a number of times, but cannot get this cylinder to perform properly. They went over the timing and installed a new carburetor temporarily, but could not seem to remedy the trouble. They advanced the theory that with one cylinder larger than the rest, it would require more gas, take a different mixture or something of that kind. What do you think?

Reply.—Although there may be some truth in what the experts say regarding the additional amount of fuel required for number four cylinder, the difference in mixture, etc., we doubt if this is the whole reason for your trouble.

However, assuming that the amount of metal removed was .001 of an inch on each side, the total amount of gas required for a four-inch stroke would be less than half of a cubic inch. We doubt very much if every engine on the market today is so carefully designed that the cylinders do not vary more than one-half of the cubic inch. We should advise you to obtain a compression gauge and com-

Digitized by Google



pare the pounds compression in each of the cylinders with that in number four. An unbalanced compression will do more toward uneven operation than any other factor. By installing the new rings in a rebored cylinder you probably increased the compression some few pounds, and we would not be surprised to hear that you had an engine that was knocking. We wish that you would let us know just what you find about the compression, and also tell us whether or not the pistons were changed. By chance you might have put in another piston which increased or reduced the cylinder volume slightly, just enough to unbalance the whole machine.

There is one more experiment that we would like to hear about, and that is the valve lift. Compare the measurements between the top of the tappet and the tappet guide when it is in its highest and lowest positions. Tabulate all of the measurements for all of the valves and let us know the results. Also be sure that the valve clearance between the tappet and the valve stem is approximately the same in all cylinders.

If you will give us the above data, we will be glad to advise you further, for the trouble is such that we do not like to give an answer based only upon your letter.

2423 **Ammeter for Hupp 32.**

From H. & L. Garage, Illinois.—Will you please supply a wiring diagram showing how to insert an ammeter in the circuit of a Hupp 32. This car has no ammeter to show charge or discharge.

Illustrating Method of Inserting Ammeter in Circuit of Hupp 32.

Reply.—The accompanying illustration shows the wiring plan of the car referred to and the place for inserting the ammeter in the circuit.

2424 **Knock in Muffler.**

From Thomas Bryant, New York.—No. 1. I have a Republic truck which has been run about 1,000 miles. Of late I have noticed a peculiar knock which appears to come from the muffler. I feel the knock mostly by laying my hand on the muffler. I notice it most in starting the car when it is cold. Could you please help me in solving the trouble?

No. 2. My friend has a 1917 Overland which gives him much trouble when shifting. He is seldom able to shift or put the gears in first or reverse without first going ahead a few feet in second speed. Why is it that the shifting lever cannot be put in either speed at the position when the car has been standing, without such difficulty? The gears seem to be all right. The car has been run about 14,000 miles.

Reply.—The trouble may be due to the fact that the muffler is not fastened tightly upon the muffler pipe. Again it may be caused by the use of heavy fuel such as is now on the market. This heavy fuel question is taken up in full in the March issue of the Automobile Dealer and Repairer, and we would advise you to read it through. Try to locate the knock more definitely or disconnect the muffler and remove it from the car. If the knock is still evident, disconnect the exhaust tubing on the muffler and if the knock still persists examine the connecting rods and piston. Let us hear what the results of the experiments are.

Your friend's trouble with the 1917 Overland is probably due to the fact that at some time or other he has tried to mesh the gears with the clutch engaged and has bent over the edges of the teeth. Tell him to make a careful examination of the second speed gears and see if the teeth are smooth. Trouble of this sort is sometimes caused by lack of oil in the clutch shifter yoke and bearings. This trouble can be located easily by trying to turn the clutch while it is disengaged. If it does not turn smoothly, it is an indication that the bearing needs repairs or needs grease.

Good Word For Johnson.

From L. A., Rhode Island.—I don't usually do very much talking about different things that I try on my automobile or in it, but not long ago I noticed one of your ads about Johnson's Carbon Remover, so I decided to take a shot at the stuff because my old engine had not been giving just the best results and I did not want to pay two or three dollars for having the carbon removed. I decided to take two or three days off and fix up the machine so long as I had started, so I went down to the accessory dealer and bought a can of Johnson's Carbon Remover. I followed directions, and after I had used it I removed the cylinder head and looked at the cylinders. That liquid certainly did the work, because the cylinders and firing chambers were just as clean and smooth as they could be. I thought that if all of Johnson's products were as good as his carbon remover I would try some more of them when I needed to.

I tightened all the loose bearings, cleaned out the crank case with kerosene, put in some fresh oil, cleaned up the radiating system and put on some new hose connections. I flushed the radiator out with a sal soda solution, leaving the solution in and running the engine until it became good and hot. Then I cleaned the solution out by flushing with clean, fresh water.

I guess that the sal soda solution must have taken out something besides the dirt in the radiator, for it had three or four small leaks, where the tubes were joined to the upper and lower parts. Leaks were not very bad, but they worried me so I took a chance on Johnson's Radiator Cement. The dealer told me that the stuff would not interfere with the circulation of the water, and I guess he was right, for although it stopped the leaks it didn't seem to stop up any of the pipes. I pulled apart the transmission and replaced the brake bands and was obliged to put in two new gears, and if anybody has ever put in a Ford transmission gear they know

Digitized by Google

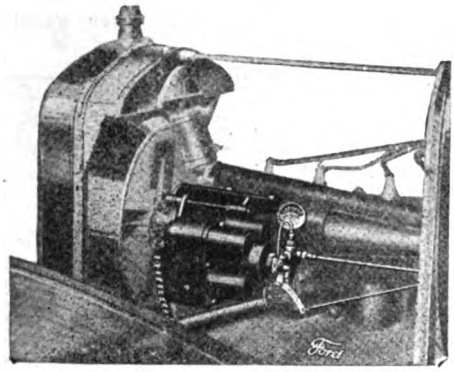
what a job it was, but I finally got it together all right so that it worked all right. I fixed up the rear axle and put in new grease.

In all I guess I spent three whole days on the job, but it certainly repaid me, because the car ran almost as well as it did when I first bought it. I had a friend come over from the garage to help me out on some of the adjustments, for I believe in having things done right, and I don't know everything about a car yet, even though I have driven one for five years.

I was not quite satisfied with the looks of the car, for its dress did not go with its works, so I washed it carefully from top to bottom and looked it over again. In many places the paint had been scraped off and the Ford looked pretty old to me. So I took some fine sandpaper and smoothed up all of the rough spots. I gave the body a coat of Auto-lak and put some Black-lak on the top and side curtains, and this made the old bus look new again.

Now I believe in doing people that help me a good turn, so when anyone asks me what to use on their car I always tell them to write the S. C. Johnson & Son Company, and as they advertise in your paper, I thought perhaps you might want to publish my letter. If any of your subscribers want to know anything more about Johnson's preparation tell them to write to me.

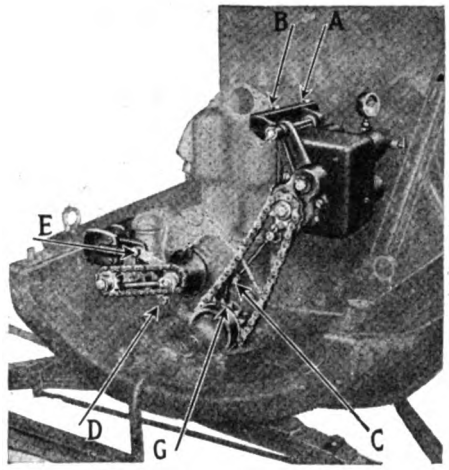
Our reader did not want his name published, but the letter was so good that we decided to publish it. We are glad that our subscriber is so satisfied with one of our advertiser's products.—Editor.



NEW AND INTERESTING THINGS IN MOTORDOM

Tire Mileage Book.

How long will a tire last? This is a question which the Racine Auto Tire Company of Racine, Wisconsin, manufacturers of auto tires, proposes to have customers answer by means of a clever mileage record which they are distributing through their dealers. The book is designed to inspire car owners to keep a record of the service given by each tire. It is so arranged that, although almost every accident that can happen to a tire may be noted, the book is small enough to slip into a bill case. It seems to be a good idea well worked out, and shows the faith the Racine Auto Tire Company has in its product.



Aero Starter.

There are two things about automobiling that are the bane of every Ford owner's existence, cranking the engine and pumping the tires, and it would seem that the New Starter Manufacturing Company, 1901 Western Avenue, Chicago, Ill., have offered a solution, by the introduction of their aero starter. This device is a radical innovation in the starting system line and consists of two units, the air pump, with regulator, and the starting motor. The air pump, air compresser as it is termed, automatically maintains pressure of 200

Showing Rear View of Aero-Starter As Mounted on Ford Engine.

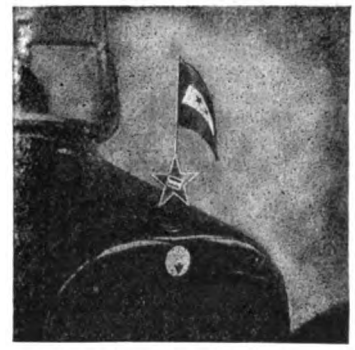
pounds in an electrically welded storage tank, which is tested to 600 pounds, and automatically stops when the pressure is reached. This unit is mounted high on the side of the engine and is driven by a sprocket chain. The air engine, which is in operation only at the time of starting, drives through a sprocket chain and takes the pressure for starting from the storage tank. With the outfit is furnished suitable length of tubing for inflating the tires. The whole outfit is

Showing Front View of Aero-Starter and Air Compressor. Letters Indicate Ford Bolts Used in Mounting on Engine.

extremely simple and the installation can be made by the average mechanic in from two to four hours. The installation of this device requires the boring of no holes in the engine or cylinders, the regular Ford bolts being used in every case.

Thrift Stamp Day.

Every reader of the Automobile Dealer and Repairer is requested to do his part in making the first day of May a success as Thrift Stamp Day. Every person, who makes a purchase on that day, is supposed to accept at least one thrift stamp as change and to invest as much money as possible in stamps.



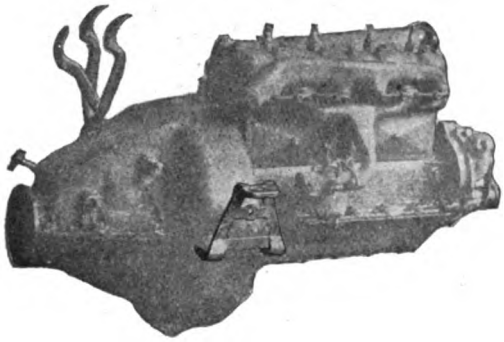
Guaranteed Tractor.

Doubtless many of our readers, this coming season, will do considerable work in the cultivating line. Again, many of our readers may be interested in machinery for farming work, and we want to call their attention to the guaranteed tractor made by the Guaranteed Tractors, Inc., 2700 Michigan Avenue, Chicago. This device is of great interest because it may be attached to any one of a great number of the popular cars on the market today and makes a tractor of practically any automobile. The whole device consists of two large internal drive tractor wheels attached to suitable frame which is clamped to the rear axle of the passenger car after the regular wheels have been removed. In place of the regular wheels special small gears are attached, these gears meshing with the tractor wheels. The manufacturers claim that, with this device on a small car of from 20 to 25 horsepower, an equivalent of four horses' work may be obtained, for drawing plows, harrows or other farm implements. The gear reduction through the wheels is eleven to one and, when taken in conjunction with the average gear box, offers a very high gear reduction, giving considerable pulling power.

The Guaranteed Tractor may be attached by practically any mechanic in a minimum amount of time and requires but very little alteration to the car itself.

Liberty Star Flag Holder.

For the patriotic automobile owner, the Liberty Flag Holder Company, 60 Grand Street, New York City, are supplying a Liberty Star Flag holder and a silk American flag at a very low



Liberty Star Flag Holder.

price. This flag holder attaches to the radiator cap of practically any machine and is in the shape of a five-pointed star. The upper three points of the star are arranged to take a small flag staff.

Digitized by Google

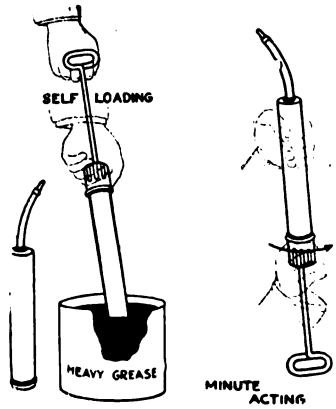
Crank Case Repair Arms.

The Hudson Motor Specialties of Philadelphia, Pa., for some time have been manufacturing their crank case repair arms, which are designed in such a way that they may be hooked beneath the

Crank Case Repair Arms.

flanges projecting from the Ford flywheel bell housing, and bolted to the chassis. These arms were designed to meet the demand for a quick repair attachment which would eliminate the necessity for removing the whole engine should the crank case retaining arms be broken. The manufacturers now announce that the design has been changed, so as to permit the use of the arm on the Ford one-ton, worm-drive trucks.

Copeman Lubricating System.



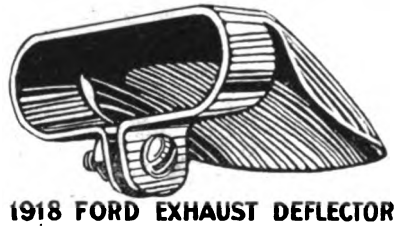
Something distinctly novel in the lubricating line has been introduced by the Copeman Laboratories, Inc., of Flint, Michigan, in the Copeman Lubri Cups. This system is designed to be placed on any bearings fitted with ordinary grease cups and is claimed to give great efficiency. The caps themselves are made of heavy metal and are ornamental in appearance. The caps are fitted with a heavy feed screw which actuates a grease forcing plunger. The feature of the device is the lubri cup, which is a specially manufactured paper capsule containing a high-grade hard grease, which is placed inside the cap, forming an air-tight grease chamber. When the feed screw of the cap is turned, a pressure of 745 pounds to the square inch is developed, forcing the grease into any bearing.

Tire Repairing Booklet.

The Akron Rubber Mold & Machine Company of Akron, Ohio, have recently published a little book entitled "Tire Repairing, the Business of the Times," in which they give the reasons why tire repairing today is a lucrative as well as useful occupation for the automobile man. Among other things they say that there is room at present for at least 5,000 more tire repair shops in this country, and they give a number of suggestions for conducting a tire repair business in their little booklet which may be obtained upon request.

Wonder Minute Gun.

Something distinctly new in the line of grease and oil guns is manufactured by the Sidell Rattner Manufacturing Company, 3135 Broadway, Brooklyn, New York. This device is termed "The Wonder Minute Gun," and will handle the heaviest grease as well as the lightest oil with equal facility. It is made of two steel tubes which telescope into each other and is secured by a patented tapered grip which locks the shell to the container firmly with a single motion.



Wonder Minute Gun.

The cylinders measure 1¼ and 1⅝ inches in diameter. The illustration shows how the gun is used, as well as its construction.

Exhaust Deflector.

A. P. Worthington of 700 No. Main Street, Los Angeles, California, market an exhaust deflector for the Ford car. This deflector is designed to prevent the exhaust gas and carbon formations from depositing on the underneath side of the

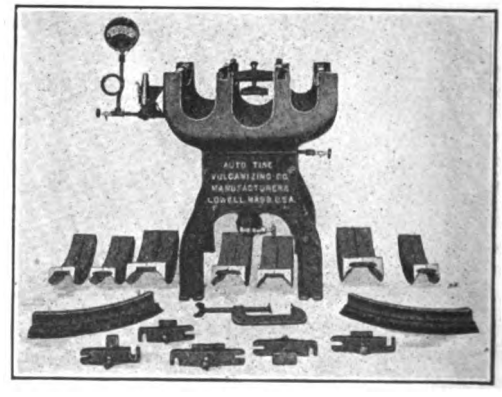
1918 FORD EXHAUST DEFLECTOR

Ford body and the frame. It is made from heavy steel and fits the 1918 Ford muffler casting. Where a tire or a suit case is carried at the rear of the machine this deflector prevents the exhaust from spoiling the tire or damaging the suit case.

Safety Tail Light.

The King-Bull Manufacturing Company, at 123 East Ontario Street, Chicago, Illinois, have recently brought out something novel in the way of a safety tail light. This device is a combination of tail and illuminating light. The ordinary tail light is arranged to show red at the rear and to illuminate the number, while a second and larger light is controlled by a switch from the driver's seat and throws a beam of white light fifty feet back of the car, the full width of the road. This light is only used while the machine is being backed or when the driver desires to see the road in back of the machine.

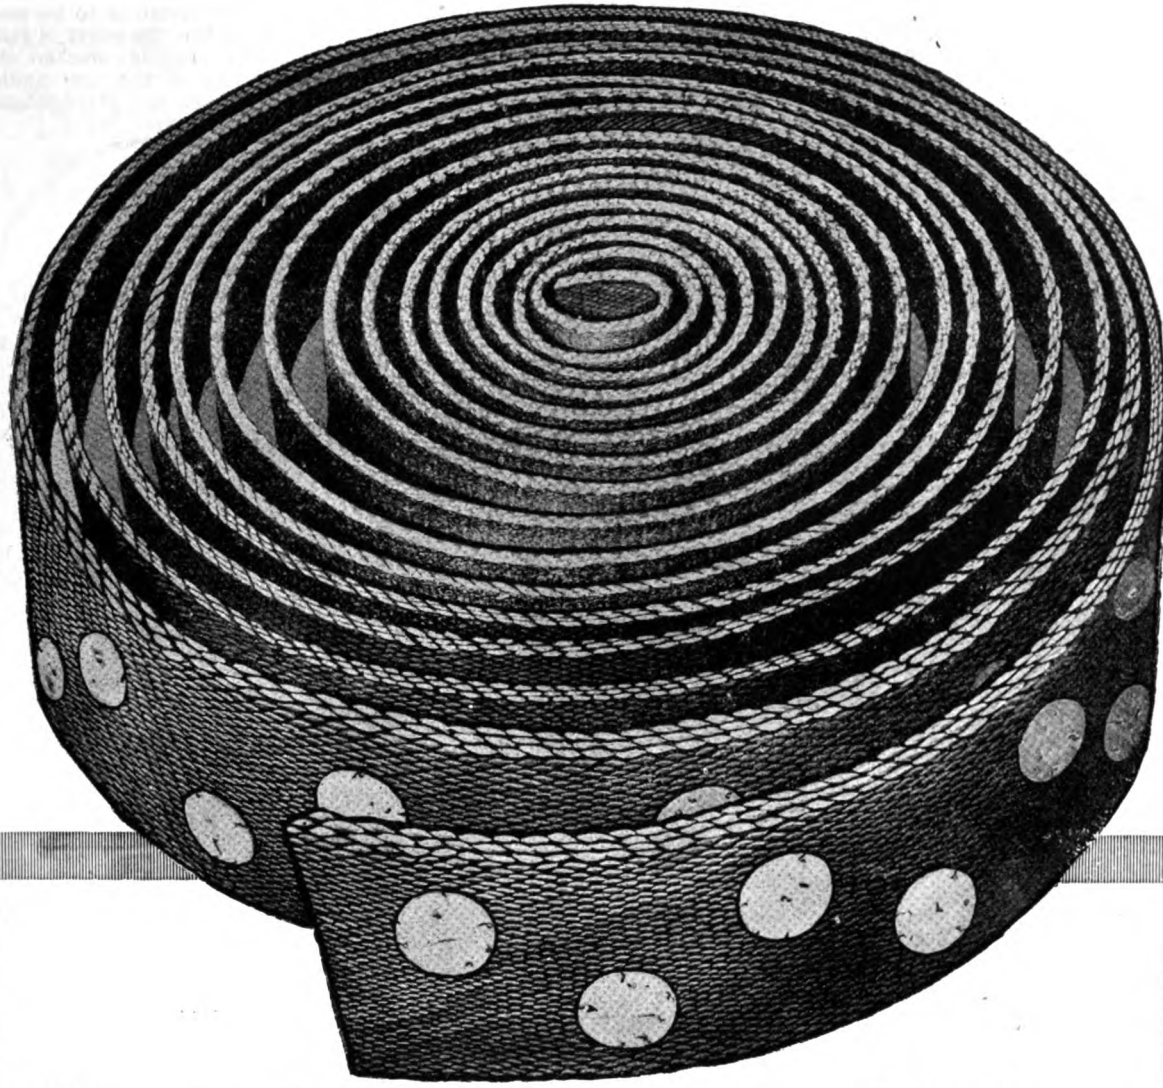
Safety Tail Light.



The Currier Tiller.

The Farmers Mutual Plow and Tractor Company of St. Louis, Missouri, are now building a truck gardener's tractor which is termed the Currier Rotary Tiller and weighs only 125 pounds. The engine is connected directly to the rotary shaft, upon which the spiral plates for tilling are attached, and revolves 250 revolutions per minute. There is no connection between the engine and the wheels. The propulsive power is had through the action of the cultivator in forcing the soil back, and is said to be ample. In this principle very little weight is necessary for the machine itself and so it may be operated at a minimum amount of cost.

Anyone interested in this machine should write the manufacturers for literature and prices. No doubt this year will see a great advance in the farming line and garage owners should make arrangements for opening agencies for such tractor devices.



The Three Cavity Vulcanizer.

We have called the attention of our readers, repeatedly, to the field open in tire repairing. This branch of the automobile business affords quick and ready profits and should be investigated. An interesting vulcanizing outfit, model No. 8, is sold by the Auto Tire Vulcanizing Company of Lowell, Mass., and is designed for general vulcanizing of clincher or straight side tires, from three inches to five inches in diameter. Our illustration shows the outfit complete with steam gauge, safety valve, clamps and bead molds. The vulcanizer illustrated is fitted with a gas burner for generating steam pressure, but the same machine may be obtained without the burner for connection with a steam generator. Should the shop not be equipped with illuminating gas, either gasoline or kerosene may be used as desired. Extra moulds may be obtained at additional prices.

The Three Cavity Vulcanizer.

Cork Insert Brake Lining

gives a SURE brake ALL the time

3 Big Points of Superiority

1 Less pressure required on pedal

Cork Insert Brake Lining has by far the highest co-efficient of friction of any lining. It *takes hold* firmly at the slightest touch of the toe to the brake pedal. Less pressure means less heat, longer wear, more positive service.

2 Unaffected by oil or grease

Oil on ordinary lining, destroys its ability to *hold*. Makes it undependable and dangerous. Cork Insert Brake Lining is not affected by oil or grease. It is always *dependable* —always can be relied on to *take hold* instantly—positively.

3 No grab, slip or SQUEAK

Cork Insert Lining never glazes over or gets slippery—insures freedom from grabbing and slipping. Both corks and lining wear very slowly. It gives a longer service than any other lining and holds its high frictional qualities and original efficiency to the last mile.

DEALERS! Here's another big money maker for you. The success of Cork Insert Transmission Linings and Fan Belts for Fords is being repeated *in an even bigger way* in Cork Insert Brake Lining. It is handled by the same jobbers who handle the other Cork Insert products. Get this lining in stock for it is *going big.*

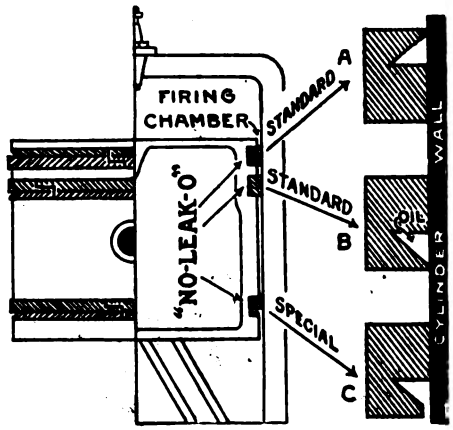
Esta Water Auxiliator.



Every motorist realizes that 50 per cent. of his engine troubles may be traced to carbon. Carbon accumulates in the explosion chamber, reduces the volumetric efficiency, prevents the functioning of the valves, causes preignition and often results in the scoring of cylinders and the necessity for expensive repairs. For a long time engineers have been working upon a device for the prevention of carbon and many of them agree that the introduction of water vapor into the cylinders with the fuel has a tendency to cut down, and in some cases eliminate carbon trouble. Upon this vapor principle the Esta Water Auxiliator Company, Inc., 1838 Broadway, New York, have designed their water auxiliator, which they claim is a practical solution for the carbon problem.

This device consists of a water tank and suitable tubing and connections which may be attached to practically any engine now on the market. In the top of the tank is a filling tube which extends down to within a short distance of the bottom and at the bottom of this is an annular opening. The front of the tank is fitted with a circular glass face through which the water level may be observed. When the engine is in operation the partial vacuum in the intake manifold draws air down through the filling tube of the accelerator in the form of extremely small bubbles. This air in passing through the water becomes heavily laden with moisture and passes through the connecting tube to the manifold and the cylinders. The tank may be attached to any part of the engine or body where it is convenient for filling.

The manufacturers claim that with this device properly installed, the engine operates more smoothly at a decreased cost, with increased speed and power and with no carbon deposits in the cylinders. The reason for the increase in power has been explained by saying that the water vapor upon reaching the hot cylinders is disintegrated or broken up into its original elements of oxygen and hydrogen, forming an explosive gas combination, which adds to the explosive power of the fuel.

No-Leak-O Piston Ring.

Perhaps no problem today is greater than that brought forth by the leakage of oil past piston rings. Many engine designers have tried to solve the problem, and the Automobile Accessories Company of 1824 West North Street, Baltimore, Md., are producing an oil cylinder ring which in their opinion is a solution of the problem. These rings are individually cast from a special formula of close grain, tough, gray iron. By a special patented process uniform

No-Leak-O Piston Ring.

tension is produced, without hammering or peening. The joint is of the step-joint type and the lower edge has a channel cut around it, the upper side of which is at right angles to the ring face. At an angle of forty-five degrees to this is the lower side of the channel. The manufacturers claim that this V-shaped channel picks up the oil, which has splashed from the oil base, and distributes it around the circumference of the cylinder. Excess oil on the cylinder walls is scraped off by the upper edge of the channel. This means that the groove at all times is practically full of oil, forming a tight seal for the firing chamber.

Foamite Fire Pails.

Every garage man, or automobilist, realizes the difficult task one has in extinguishing burning gasoline. The Foamite Fire Extinguisher Company of New York have recently put on the market a fire pail, which would seem to be of great interest to every garage owner, as well as every automobilist. This fire pail, from outside appearances, resembles an ordinary tin pail but differs, in that it is fitted with a separate compartment in which is contained a solution of aluminum sulphate. The outer compartment contains the Foamite compound.

When the device is to be used for extinguishing fire, the cover is removed and the contents forcibly dashed on the fire. The mixture of the two liquids causes them to expand and form tough, durable,

Foamite Fire Pail.

fire smothering foam composed of minute bubbles of carbonic acid gas, sufficient to cover an area of 50 square feet. Foamite is said to coat all solid burning materials such as wood, cloth and paper, and floats on volatile liquids, extinguishing all fires and making re-ignition difficult.

Anthony Tire Pump.

A pump which should be of interest to every automobile owner who has had experience with troublesome and leaking air devices for inflating tires is known as the Anthony tire pump. There are many features which deserve consideration, the most important of which is the valve mechanism. This valve is made entirely of metal and is guaranteed by the makers to be 100% efficient. The barrel is made of seamless steel tube, fitted with a malleable iron base, and a cast brass cap with a long bearing for the piston rod. The piston rod is 7/16 steel and will not bend or spring under the hardest service. This pump is made in five sizes and is guaranteed by the manufacturers, the Anthony Company, 138 West Avenue, Long Island City, New York, to give satisfaction.

Do you know what scientific management means as applied to the financial end of your business, or are you going along in the old ox cart ways of a century ago? Don't be satisfied that everything at this end of your business is O. K. unless you know what you are talking about and have consulted some one who knows more about it than you do.

Made from Oil-Tempered Spring Steel Wire

They Remove Carbon Where Others Will Not

PATENTED MARCH 28, 1916

Cut out experimenting—get down to business. Why not own a set of FLEXIBLE CARBON SCRAPERS? They are the only scraper on the market that will do a satisfactory job without taking the motor to pieces. Compounds are dangerous. All good mechanics advise scraping carbon. Over 100,000 sets now in use by Auto Mechanics.

NO-LEAK-O

NO CARBON—LESS FUEL—MORE POWER

Seven years of successful growth. Reputation gained through actual service. Results and popularity of NO-LEAK-O Piston Rings have brought out imitations. There are none "just as good"—insist on the original NO-LEAK-O—The successful grooved Piston Ring. All NO-LEAK-O Rings are oil-controlling rings. That's why they are superior to any other ring. Write for free booklet. Popular sizes 50c. Guaranteed to give satisfactory service or money back. Discount to the trade. If your jobber can't supply you, order direct.

See that groove controlling the oil?

Bowers Magnet Tester.

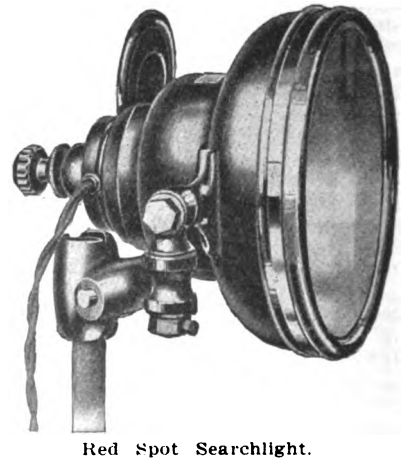
A handy device for the motorist or the garage man is manufactured by the Bowers Manufacturing Company of Grand Rapids, Michigan. This device is a combination magnet, compression and air pressure testing and indicating gauge, and is illustrated herewith as used to test the amount of magnetism in a Ford magnet. The tube is hollow and is so arranged that it may be put in the place of a spark plug. When the engine is turned over the actual pounds compression is indicated on the gauge at the top of the device. In a similar manner it may be used to determine the pressure of air in pneumatic tires. Magnetism is measured by the amount of holding power which the magnet retains and is found by placing the bar at the top of the indicator across the poles of the magnet. This instrument does all of the guess work in making tests of these three kinds.

Bowers Magnet Tester.

Ten Eyck Starting System.

The Ten Eyck Starting System, manufactured by the Air Device Company, 2975 Cottage Grove Avenue, Chicago, Illinois, is something entirely new in the way of engine starters and consists of a single cylinder air pump driven direct from the crank shaft by a roller chain; a storage tank with suitable valves and connections, and a distributing valve arrangement, attached to the engine cylinders. While the engine is running, air is pumped into the tank. During the day and while in operation, pressure is maintained by an ordinary check valve. If the machine is to be left any length of time, however, a second valve, called the night valve, is closed, thus keeping the air in the tank. In starting the engine, air pressure is admitted to the cylinders through a distributing valve which is timed to admit air pressure to the cylinders in their firing order. Under ordinary conditions the air pressure will turn the engine over at approximately 350 revolutions per minute. The manufacturers claim that from 12 to 20 starts can be obtained from the storage tank when it is charged with the full pressure of air. The device is also used in pumping up tires, the compressed air in the tank being utilized for this purpose. At present it is designed especially for the Ford car.

Automobile Instruction.



The Michigan State Auto School, Inc., 687 Woodward Avenue, Detroit, Michigan, has been giving instructions in automobile work for a number of years and has added, recently, branches of instruction in tractor work, welding, specialized tire repairing, and aeroplane instruction and maintenance. This school has an enrollment of 685 students and preparations are being made to accommodate a greater number for this coming year.

Painting Outfit.

The automobile owner who is interested in restoring the finish of his car and obliterating the marks of last winter's usage should investigate the Simple Painting System,, manufactured by F. O. Pierce Company, 12 West Broadway, New York City. This system is designed so that it can be applied by practically any car owner and is put up in sets complete with brushes. The materials used as well as the methods are identical in qualifications with the methods used by automobile painters. The different finishes are put up in ready mixed form. The manufacturers have had fifty years of business experience in catering to the wants of painters and they claim to give the automobile painter the benefit of this vast experience.

Red Spot Searchlight.

A larger and more powerful Red Spot Searchlight has just been brought out by F. W. Wakefield Brass Company, Vermilion, Ohio. This new searchlight is seven inches in diameter and has a strong 30-candle power lamp, being especially adapted to road work. Red and white rays are interchangeable merely by pressing a button so that the light may be used one instant as a danger signal and the next instant as a white light of extraordinary power.

Red Spot Searchlight.

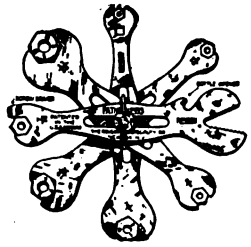
Rectifiers

RECTIFIERS to charge from A-C circuit 1 to 8 ignition lighting or starting batteries at one time, $12.00 upward. American Battery Co., 1136 Fulton St., Chicago, Ill.

Klear-Sight Windshield Cleaner

The Alcemo Manufacturing Company of Newark, New Jersey, are manufacturing what is termed the Klear-Sight Windshield Cleaner. This device is designed to slip over the top of any windshield and press against the surface outside. This pressure surface is of a piece of rubber which will not scratch the glass. Projecting on the inside of the cleaner is a knob by which the device may be moved from one side of the shield to the other, wiping off snow, rain or sleet, by a movement of the hand.

Universal Valve Grinding Tool.



L. J. Kaiser, 146 Park boulevard, Detroit, Mich., announce a new Universal valve grinding tool which should be of interest to the repair trade. This tool is designed to be fitted in the ordinary carpenter's bit stock and has a removable head.

Battery Service.

The Universal Battery Company of 3420-24 South LaSalle Street, Chicago, is now offering a battery service which will no doubt be greeted cordially by all garage owners, service stations and supply men. Heretofore it apparently has been necessary for those in the auto repair business to deal with a dozen different makers of batteries and battery parts in order to get supplied with the hundred and one parts which battery users are constantly in need of. This necessity for dealing with so many different makers has always been a source of considerable irritation and confusion in the auto repair business.

The Universal Battery Company claim that this haphazard, unsatisfactory method is now obsolete. They state that they not only make and carry in stock complete batteries, but that they also have on hand at all times plates and parts for every battery for which there is a popular demand. They are also manufacturers of vehicle plates and parts for both pleasure cars and commercial trucks. The Universal Battery Company promise complete service in every detail; in a word—perfect service.

Auto Tops.

A matter of some interest along Automobile Row is the change in name of the well-known New York Auto Equipment Co., Inc., who will hereafter be known as George W. Copp Co., Inc.

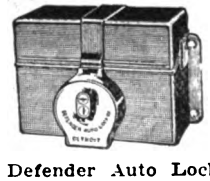
Mr. George W. Copp, the president of this concern, has been identified with the automobile trade for a number of years in New York, and his company has achieved an enviable reputation among the manufacturers of automobile top and body equipment. Mr. Copp's many friends have cangratulated him upon this change, which emphasizes his personal responsibility in the product of the company.

A Victoria Top Made by Copp.

The slogan "For your top, go to Copp," is given increased significance, and the handsome Victoria top which is illustrated herewith seems to prove that the admonition is a good one.

Adamson 5-Minute Vulcanizer.

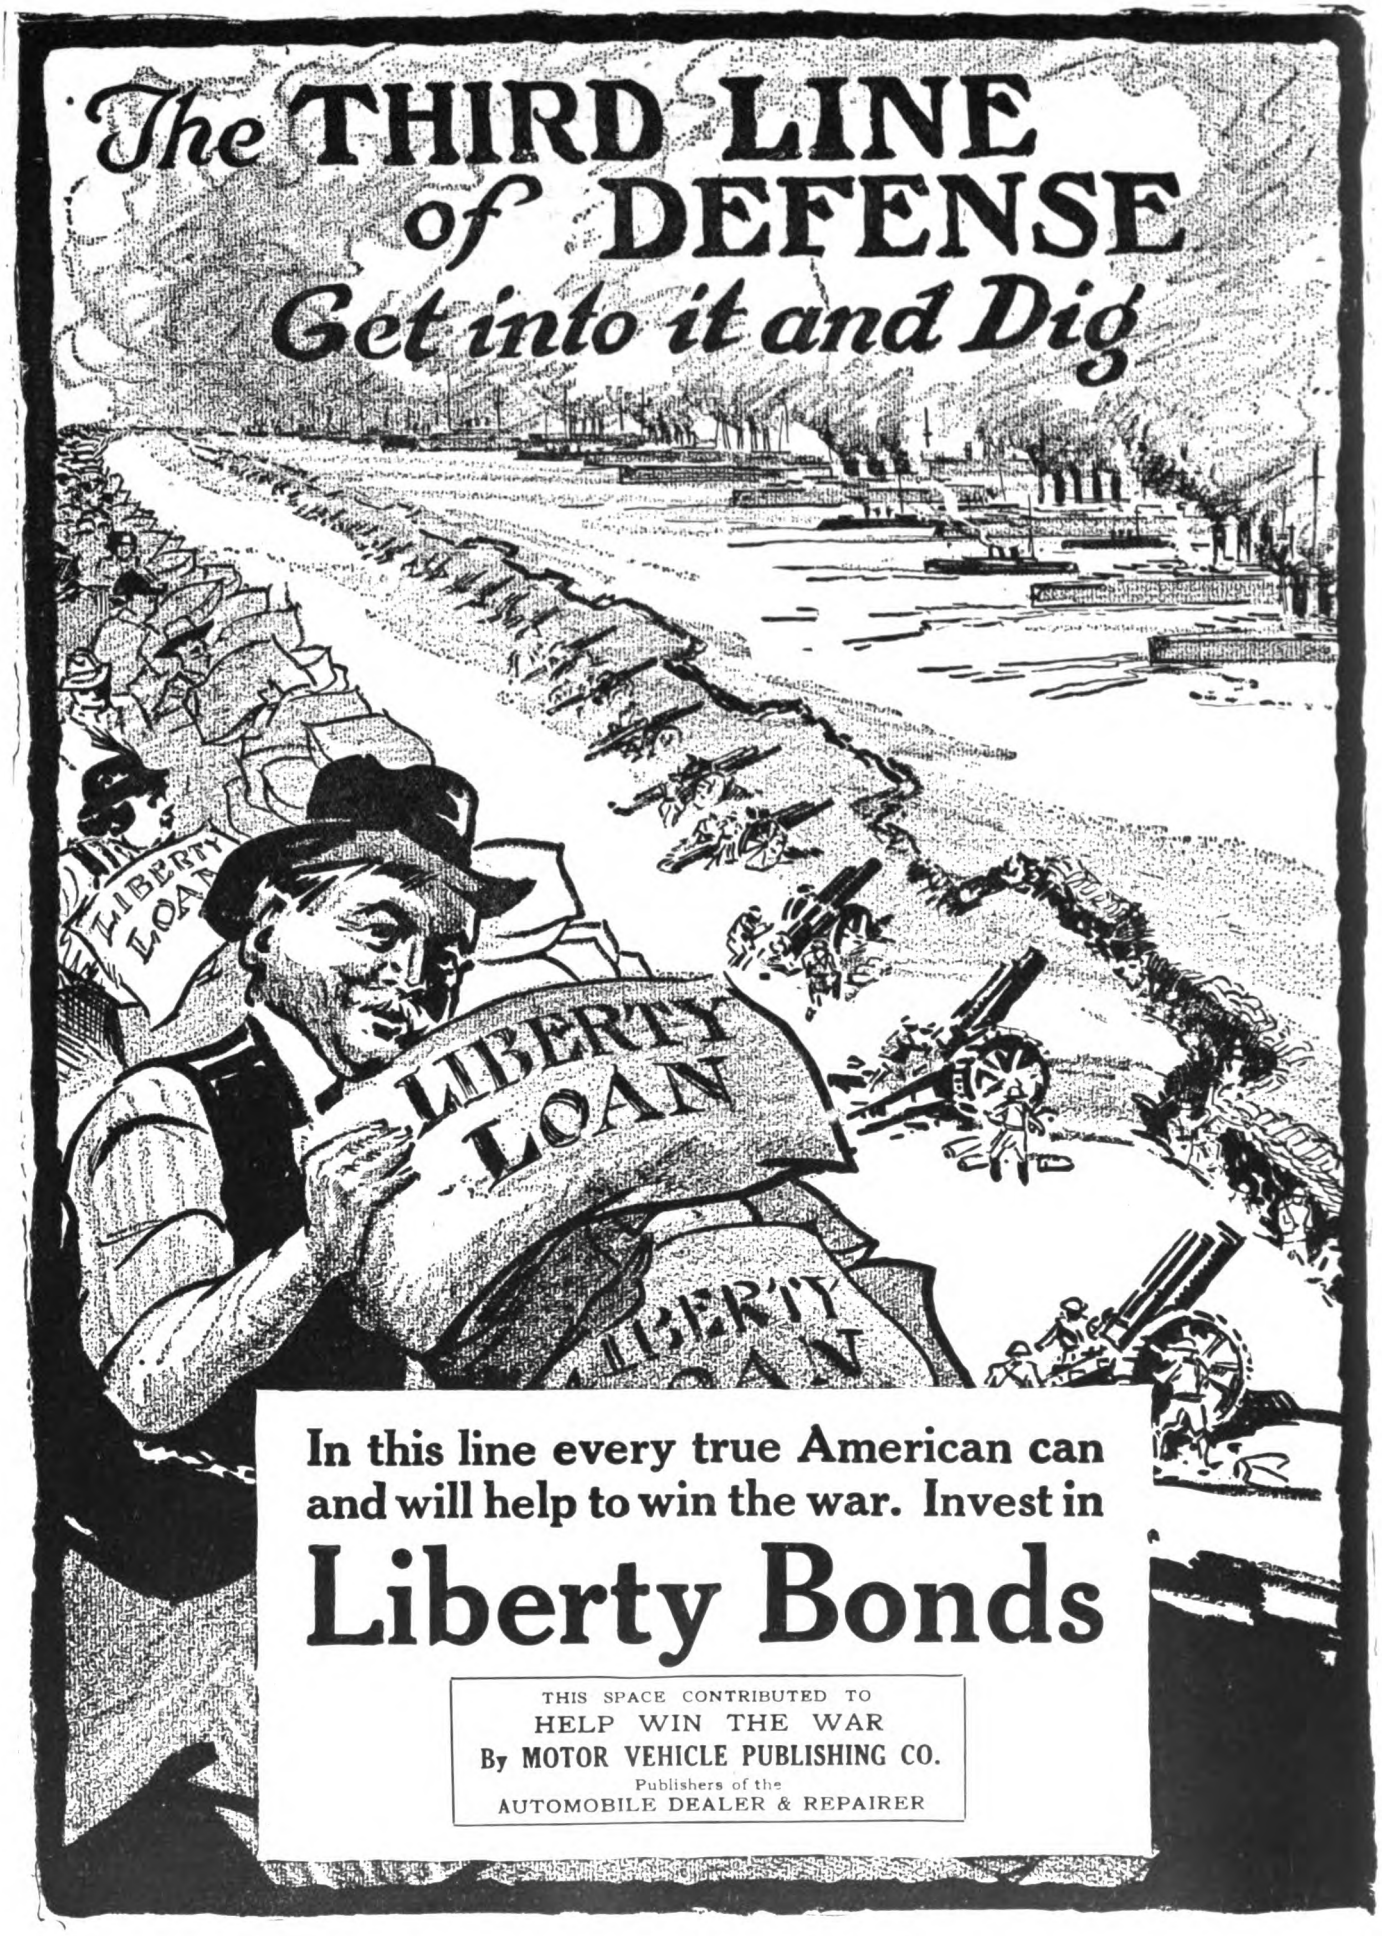
An entirely new and improved feature in portable vulcanizers is the use of powdered dry fuel for heating. This fuel is furnished with the Adamson Model E outfit for repairing tube punctures and comes in a small round box with a small measuring cup. This cup is filled with the powdered fuel and poured into the vulcanizer and burns with a hot flameless glow which is said to vulcanize the patch permanently. The 5-Minute outfit includes the vulcanizer, one can of dry fuel, a box of 12 patches, sandpaper and directions for use. The Adamson Vulcanizer is manufactured by Adamson Manufacturing Company, Cleveland, Ohio.



Adamson Five-Minute Vulcanizer.

Smooth-On Iron Cement.

The Smooth-On Manufacturing Company of Jersey City, New Jersey, market an iron cement for repairing leaks in water jackets, boilers, tanks, screw thread joints, flanges, etc., and it would seem that a new field has been opened for this product in the repairing of scored cylinders. Smooth-On is said to work well if the cut is deep or jagged, and it is applied by diluting it with salamoniac. The cement is applied to the score with a whittled stick and while it is still wet the piston is passed through the cylinder to remove the superfluous cement. The rings should be removed from the piston before this is done, however. After the cement has hardened, over night, the rings may be put into place and the Smooth-On cement scraped to conform with the shape of the piston.



Defender Auto Lock.

An interesting device, which is said to be practically thief-proof, is manufactured by the Defender Auto Lock Company, Marquette Building, Detroit, Michigan. This lock consists of a heavy ornamental aluminum casting, which is designed to fit over the regular Ford coil lock. At the upper end of the aluminum casting is a hook through which is passed a heavy metal strip which locks the cover on the coil box. Two keyholes are provided in the lock. The first retains the cover strap, while the second controls the ignition line. An illustration of the device is reproduced herewith and is self-explanatory.

Defender Auto Lock.

Worth Fighting For?

SHALL this little girl grow up in the sort of American home we know, healthy and happy? Shall she have the advantage of living and learning in a free land, under free institutions? Shall such children develop into Liberty-loving citizens that a free America may be proud of?

For over two hundred years Americans have fought valiantly, and died gallantly, to win for themselves and hand down to their posterity the blessings of liberty, justice, self-government and equal opportunity. This precious heritage, bought at so great a price, is now threatened.

The question which today confronts America as a nation, and you as an individual, is whether or not a free America is worth fighting for

Are American children in this and all future generations to receive unimpaired the legacy of freedom of which we are now the custodians, or shall their country be turned over bodily to the brutal, rapacious, power-mad enemy which has forced us into this war?

This question cannot be answered by word of mouth, but by deeds alone.

Let your answer be your investment in

Liberty Bonds!

Meeting a Patriotic Need

AMBU—POST AMBU+POST

Yours is, no doubt, one of the thousands of garages which has felt the loss of one or two men—whose services were needed to help in this war for democracy—one of them just the man you depended upon to care for electric starting and lighting troubles and repairs.

If so—

NOW IS THE TIME TO BUY—

AMBU

TRADE MARK

Machines must do the work men used to do

The automobile is playing a big part in helping to relieve the transportation of the country—

The millions of cars must be kept in service—it is a patriotic duty—

And the extra demands made upon each and every car will multiply the need for repairs of all kinds—

The mechanical repairs are simple—

But the troubles with electric starting and lighting systems are baffling to find, many times even for an expert—

With your electrical repair man gone you face not only the patriotic duty of sharing the work of keeping the motor cars of the country running but the problem of having to refuse this kind of repair work—profitable and desirable if economically and thoroughly done—

AMBU—is the answer.

WHY?—Because with AMBU you can become an electrical expert.

You have all the available information regarding every system and every car at your finger tips.

You have 500 complete wiring diagrams of cars in use since 1911.

You have information telling you just how to correct every trouble on every one of those systems on every one of those cars.

AMBU—The Electrical Wizard—locates the trouble—accurately—automatically—quickly—when AMBU tells you what it is there is no further question.

You go right to the seat of the trouble—you don't tear the whole system apart guessing what or where the trouble is. You cannot afford—you might say you don't dare—to be without AMBU.

Car owners the country over are learning to seek out the AMBU shop for electric repairs.

Those shops are looked upon as a standard—up-to-date and reliable.

Thousands are using AMBU. Taking business away from the guessers—getting and holding satisfied customers—

Don't be one of the guessers.

AMBUIZE your shop now as a patriotic duty and to save your business.

American Bureau of Engineering, Inc.

Automobile Department

1025 So. Wabash Ave. Chicago, Ill.

Good Reasons Why YOU Need AMBU

Fills the place of the drafted man.

Hard to get good electrical men.

It gives in a condensed form the best expert brains of the country and an insight into the starting and lighting business that nothing else can.

It's the only positive way to locate trouble on starting and lighting equipments.

It gives a reputation as a Master Automobile Electrician.

It will bring business to your shop thru the monthly AMBU test.

AMBU will make electrical repairs easy and profitable.

ELIMINATES WASTE

Increases business.

More profit on electrical work. Increased efficiency—can work on all systems.

On three jobs a week at $2.50 per job it will return $390.00 per year, or over 300 per cent on the investment.

Saves time.

Does your thinking for you.

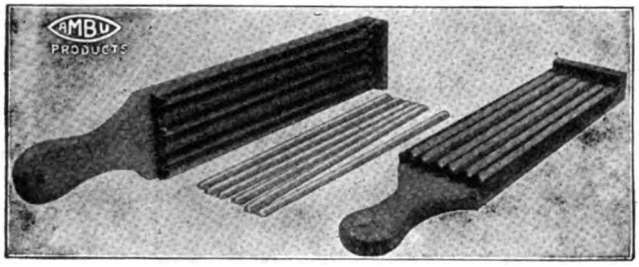
Eliminates guesswork.

AMBU Service Consists of:

AMBU INSTRUMENT, and the following sets of master equipment charts, with their wiring diagrams, instruction and battery books:

1. **Autolite**
2. **Delco**
3. **Gray & Davis**
4. **Remy**
5. **Westinghouse**
6. **Splitdorf and Apico**
7. **Bosch and Rushmore**
8. **Bijur, Dyneto and Entz**
9. **North East and U. S. L.**
10. **Wagner, Detroit, Ward Leonard**
11. **Leece-Neville, Robbins & Myers, Simms-Huff**
12. **Electro, Jesco, National**
13. **Adlake, Deaco, Esterline**
14. **Allis-Chal. Disco, Heinze**

Consultation service for one year from the delivery of AMBU. All additional wiring diagrams put out by us for one year from date.



The AMBU Trouble Shooting System consists of three parts, each of which is essential, and without any one of which the System would lose much of its value. These parts are:

1. AMBU—A Combined ammeter and voltmeter which has special patented features not possessed by any other instrument that has ever been made.

2. MASTER CHARTS—Books of instructions for the location of troubles which may arise in the electrical starting and lighting systems of gasoline automobiles.

3. 500 WIRING DIAGRAMS covering the complete wiring on the car. The complete AMBU service contains information impossible for you to obtain in any other way—viz., **showing internal hidden wiring connections rarely shown by the makers themselves**—classified, systematized, readily accessible, and filed in a handsome, substantial metal case with lock—a compact authoritative service.

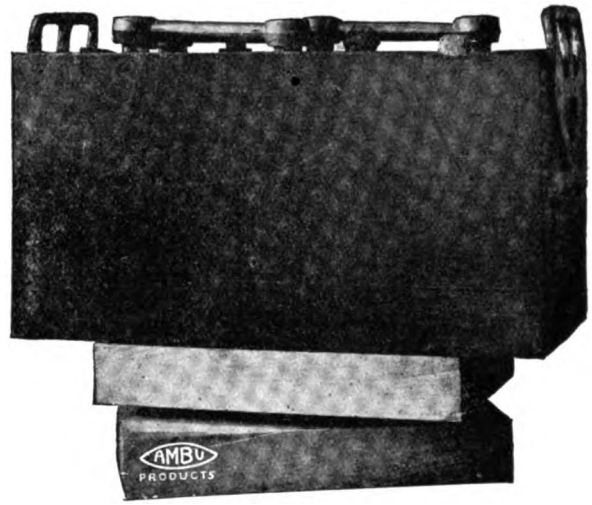
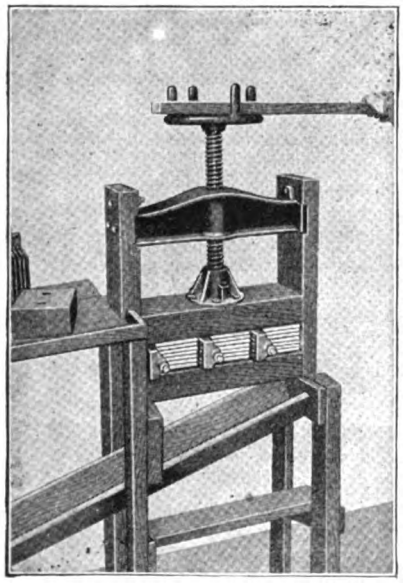
AMBU BURNING LEAD MOLD
For Molding Scrap and other Lead into Molds for making Burning Lead



Battery Repair Appliances

AMBU

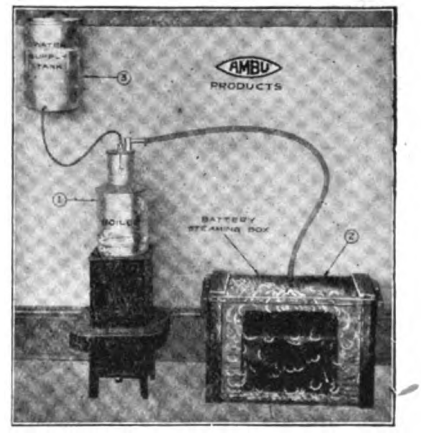


WITH these labor saving devices as a part of your shop equipment you are enabled to care for all the battery repair work in your section. These practical appliances have proven indispensable to the repair man and promise to become equally as popular as our famous AMBU **Trouble Shooter.**

Bearing the well known AMBU trade mark stamps these appliances as not only highly efficient, but they have back of them the company which has done so much for electric starting and lighting repairs through the distribution of AMBU.

There is a lot of money to be made in battery repairs, *but* the proper tools are *necessary*. AMBU BATTERY REPAIR APPLIANCES furnish the equipment necessary to do first-class work. With them you can handle all phases of this work with least expense of time and labor. *Being time and labor savers—they are money makers.*

AMBU BATTERY TURN TABLE
Saves lifting the heavy battery when making repairs



AMBU PLATE PRESS
Complete with Transite Boards

There is a crying need for each of these appliances in every shop pretending to handle Battery repairs. The cost is small compared to their money making possibilities.

Send for catalogue minutely describing each of the tools pictured herewith.

JOBBERS

The distribution of this original line is a valuable concession. We urge you to make your plans NOW for the demand we shall create through our advertising and salesmen.

Refinish Your Car!

You Can Do It Yourself

A free Sample of PANVAR will be mailed upon receipt of 10c. in stamps to cover mailing expense.

List Price
$1.50 a quart
enough to refinish a car
$5.00 per gallon

For a Beautiful, Lustrous Lasting Finish

To apply PANVAR you don't have to be an experienced painter. PANVAR isn't a paint, but a fine, permanent high gloss lacquer finish that is self-leveling and quick drying. It leaves no brush marks, no streaks, spots or lumps.

Why drive a shoddy looking car when you yourself can give it that new fresh-from-the-factory look with a quart of PANVAR and about an hour's work? Apply it today, and your car will be ready to ride in tomorrow, looking as bright and new as the day you bought it.

PANVAR is transparent, so you can apply it to any color of body. It dries with a hard glossy finish in from 6 to 8 hours.

Use PANVAR also to preserve the finish of metal parts, prevent rust, etc. Can also be used for waterproofing leaky tops, and redressing worn leather or imitation leather upholstery.

Garagemen. Use PANVAR for refinishing your customers' cars overnight. Big profit. Every car owner a prospect. Easy to apply and quick to dry.

Jobbers and Dealers. Consider the big number of car owners whose cars will need refinishing this spring. Be prepared to meet this demand. Cash in on the advertising we are now doing and will continue to do. Write today for discounts, electrotypes for catalogues, and mailing literature. Dealers and Garagemen may order direct for delivery through their regular jobber.

"You don't have to buy from us, but you will"

MACO
MOTOR ACCESSORIES CORPORATION

Mr. Dealer and Garageman

If you assure the Automobile owner, throughout the country, that he can purchase all of his accessories through a well-organized chain of retail stores and that he will receive uniform quality and product without substitution or delay, he will become a customer of yours.

Retail chain-store corporations, as you know, are successful in every line.

Our business is the Automobile Accessory Business and is founded upon and governed by the methods which have been successfully employed in other industrial lines. These methods protect those who become one of us and elevate the motor accessory field to a plane approaching perfection, finally resulting in satisfied dealers and consumers.

Our Policy is

ECONOMY, EFFICIENCY and BETTER SERVICE

If you want to know what is necessary to become one of us—
If you want to know what you have to do to become one of us—
If you want to know why it will pay you to become one of us—
If you want to know what we do for you when you become one of us—
If you want to know how we increase your business—
If you want to know how and why our name will become a home-word to the mororists throughout the country—
If you are the man with enough foresight to grasp an opportunity and take advantage of it when it is presented to you—

To Users of National Cash
Register Equipment in America

Have you found that the installation of National Cash Register equipment has assisted you in carrying out the Government's recommendation for the conservation of labor, in deliveries, clerk hire, auditing, etc.? Your experience will be valuable to other merchants. Will you please wire me fully at my expense regarding this so that we may pass it on to them?

THE NATIONAL CASH REGISTER CO.,

John H. Patterson, Pres.

What American Business Thinks of N. C. R. Service in War Time

As an aid to compliance with the Government's request for the conservation of man power and motive power, the N. C. R. System has received a striking endorsement from American business.

The following excerpts from the hundreds of replies to the above telegram are from department stores, confectioners, butchers, stationers, druggists, grocers, garagemen and many more lines of business.

"We recommend National Cash Registers to any who wish to conserve."

"Cash registers save in auditing and cashier service."

"National Cash Registers and Electric Credit System cause customers to carry packages instead of asking for delivery."

"We recommend the cash register system to every merchant who desires efficiency and economical service in his store."

"The cash register gives correct records and is a great labor saver."

"Without registers we could not handle the business with present force."

"Your cash register has been a great help in systematizing our reports and records."

"Your product is essential to the conduct of our business."

"Cash registers speed up service to customers."

For further information fill out the coupon and mail it today.

Whatever your business, the N. C. R. System will help to put it on a war-time efficiency basis.

Dept. 702 National Cash Register Company, Dayton, Ohio

Please give me full particulars regarding your up-to-date system for a Garage and Automobile Accessory Store.

SUNDERMAN

Vacuum Carburetor

F. O. B. Newburgh $6

For Ford, Metz and Saxon Four

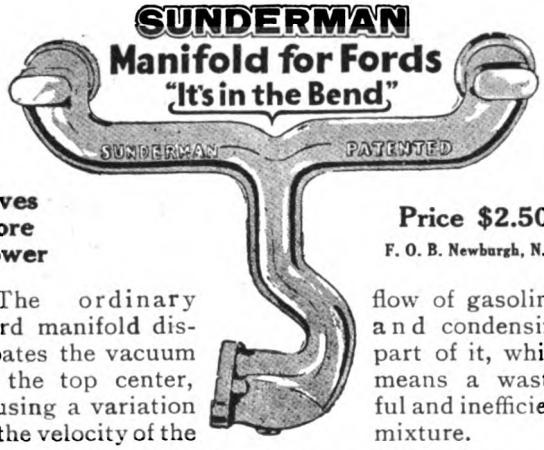
Model F

Dealers: Send us a sample order now for a Sunderman Carburetor. We back you up with great advertising support, and give you a fine proposition.

SEND us an order today for this great carburetor. Let it begin at once to make good for you. Here's what it does:

Positively saves from 30 to 50% of your gasoline. **PROVE** it.

Increases mileage from 42 to 70%. **Prove** it.



Gives more power than your car ever had. **Prove** it.

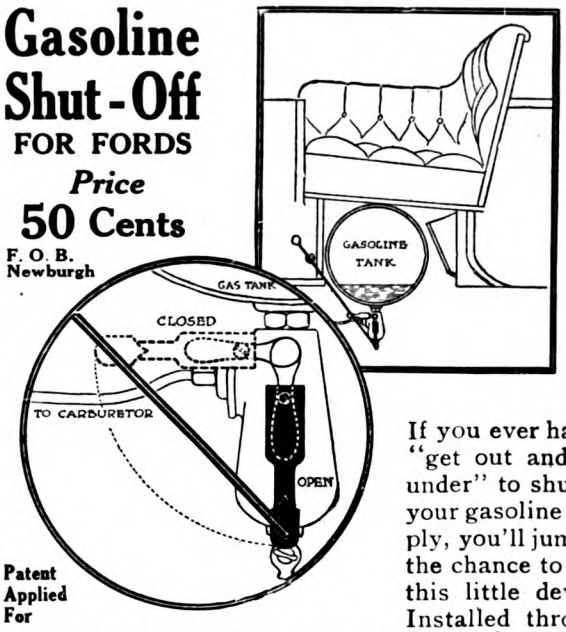
Gives greater speed, quicker pick-up, faster get-away, better hill-climbing, greater flexibility—in a word, everything you could possibly hope for in a carburetor.

Prove it—order a Sunderman today, give it a fair trial—you'll be enthusiastic over the results. You'll save the purchase price in a few days on gasoline, but send your order now.

Many thousands of Ford owners are enthusiastic boosters for this carburetor.

SUNDERMAN
Manifold for Fords
"It's in the Bend"

Gives More Power



Price $2.50
F. O. B. Newburgh, N. Y.

The ordinary Ford manifold dissipates the vacuum at the top center, causing a variation in the velocity of the flow of gasoline, and condensing part of it, which means a wasteful and inefficient mixture.

Because of the "bend" in our manifold, a uniform vacuum is preserved, a constant velocity of the mixture maintained, with a resultant economy that is worth while. A pocket in the interior of the manifold near the joint catches and holds gasoline that condenses when the motor is shut off—thus furnishing a supply of quickly vaporized gasoline in the manifold that produces quick starting.

Can be used with all Ford carburetors. The *ideal* installation is with a Sunderman Carburetor. Send your order *now*. Price $2.50.

Gasoline Shut-Off
FOR FORDS
Price
50 Cents
F. O. B. Newburgh

Patent Applied For

If you ever had to "get out and get under" to shut off your gasoline supply, you'll jump at the chance to buy this little device. Installed through a small hole on the floor board—**a pull shuts off the gasoline, a push turns it on again.** A great economy, but a more wonderful convenience. Think of what you'd give for this if you had a backfire. Then send us an order today. Price 50 cents.

MEN! ENGAGE IN THIS BUSINESS OF THE TIMES

Motor Cars Are Rendering Most Useful Service to Our Country

Automobile factories, ever since the start of the war, have been taxed to the utmost to produce enough cars for use over-seas. In this country, the use of motor cars for patriotic and useful industrial service is enormous and is increasing all the time. New plans for mobilizing the force of the automobile are constantly being brought forth.

Wherever Motor Cars Are Used, Repairing Will Be Necessary

Throughout the breadth of the land the vast fleet of automobiles already produced will require repairing far beyond the present capacity of repair shops to handle.

High Prices of Tires and Necessity for Conservation Means Still More Tire Repairing

Automobile tires will be repaired more all the time—instead of new ones being bought. This means that tire repair shops, especially on the principal highways will have more work than they can take care of.

Tire Repairing a Most Useful Occupation

Auto Tire Repairing is the business of today for men under and over draft age. It enables you to help the Nation and help yourself. The Business is profitable and the work of absorbing interest to anyone with a natural inclination for mechanics.

Start a Tire Repair Business

High Price of Tires Means More Tire Repairing

Serve the need that now exists in your own locality

With This Great New-Type-F

TIP-TOP OF AKRON TI-RE-PAIR OUTFIT

BIG CAPACITY VULCANIZER

With Self-Contained Boiler

Only $180

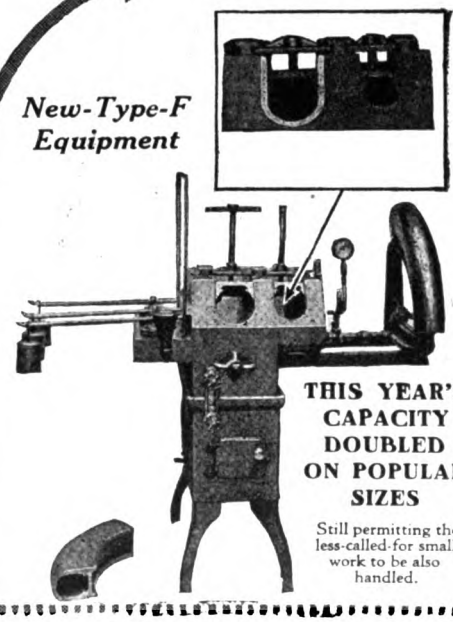
GREATLY IMPROVED THIS YEAR—Our Type F Equipment—brought out early in 1917 and one of the greatest achievements in the building of tire repair equipment since vulcanizers were invented—has been even further improved this season. Look at the illustration and read the specifications below, and you will see at once that a big capacity vulcanizer, with self-contained boiler, having the high quality and specifications of this one throughout cannot be obtained elsewhere at the price asked for this equipment.

SPECIFICATIONS.—Equipment consists of two cavities; one 4½-5 in. and one 3½-4 in., the 3½-4 in. cavity being provided with Reducing Shell to take 2½-3 in.

Also fitted with Inside Patch Attachment, 3½-4 in., on which practically all sizes of inside work can be done.

Equipped with Self-Contained Boiler.

Set of Bead Molds, 4½-5 in., 3½-4 in., 2½-3 in., in either Quick Detachable or Straight Side furnished with each outfit.



Made in one-fifth circle only.

MAIL COUPON FOR FREE BOOKLET—"Tire Repairing, The Business of the Times." It is filled with definite facts regarding the opportunities for men in the Tire Repairing Business today. Use the coupon. Be sure to mail it promptly.

WE MAKE A COMPLETE LINE OF TIRE REPAIR EQUIPMENT and are in position to furnish outfits to meet various requirements of service, output and adaptability, at prices ranging from $75 up. If interested write for complete catalog.

This year 2½-3 inch Cavity has been increased to 3½-4 inch, and provided with a Reducing Shell to take 2½-3 inch, thus permitting two popular size tires to be cured at the same time, doubling the capacity of equipment on popular sized work.

New-Type-F Equipment

THIS YEAR'S CAPACITY DOUBLED ON POPULAR SIZES

Still permitting the less-called-for small work to be also handled.

Write Us About Your Experience With This Hose—and

Win One of these *Cash Prizes*

It's worth money to us to know what service TRIPLEXD is giving its users—and we're *offering* money to *find out.*

We want to know your experience—whether it's been good or bad. If you write the best letter—that is, the letter that most logically and convincingly sets forth the reasons for your preference for or prejudice against TRIPLEXD—you'll receive $50. If it's the second best letter, $25. If it's the third best letter, $10. And if it's one of a hundred next best letters, $1.

Now Note These Conditions:

Your letter will NOT be judged on literary composition. Write it your own way—murder the King's English all you want—use pen, pencil or typewriter; anything that's handy. Your letter will be judged solely on the facts and figures you present—the actual experience you've had with TRIPLEXD.

By facts and figures we mean whatever you've made a record of. When did you get the hose? What hose had you been using? Why did you change? How much have you used TRIPLEXD? If it gave trouble—what kind and when? How many gallons per day (average) has it conveyed? And so on.

First Prize	$50
Second Prize	$25
Third Prize	$10

and 100 other Prizes of $1 each

METAL HOSE & TUBING CO.
INCORPORATED
RAYMOND & TILLARY STS.
BROOKLYN, N.Y.

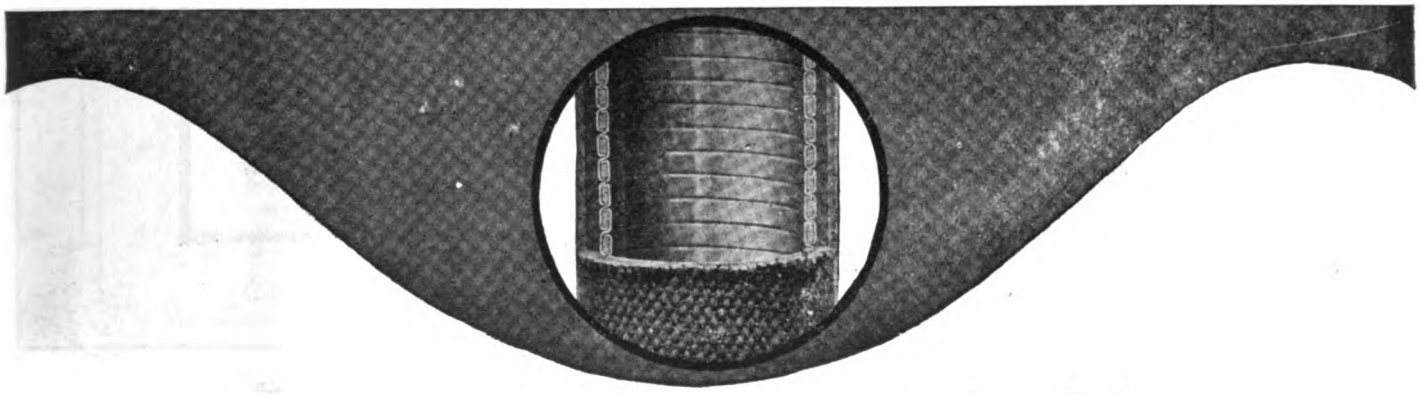
ADDRESS DEPT. C-3

And Note Further—This Is Important:

You don't have to praise TRIPLEXD to win the prize. If you've got a kick coming—that's the letter you should write. And if your letter is best, the prize is yours. We're after information.

To qualify for the prize it is necessary that you shall have been a TRIPLEXD user *prior* to Mar. 6th, 1918.

So get out your pencil and tell us all about it. And success to your efforts!



Contest closes May 1st. Prizes awarded May 15th.

Your letter will be judged by Mr. J. T. Scully, of Scully & Brandt, New York; Mr. Harvey Adams, Vice-President Auto Supply Co., New York; and Mr. J. M. Oden, President, Metal Hose & Tubing Co., Brooklyn.

In the event that two or more letters are tied for any one prize, the full amount of the prize will be awarded the writer of each such letter.

The Blacksmiths
NEED YOUR PRODUCT
Do You Want Their Trade?

Some automobile and motor accessory advertisers have been skeptical as to the importance of the blacksmith's trade.

We KNOW and can PROVE that a great majority, probably 90 per cent of the subscribers to the BLACKSMITH AND WHEELWRIGHT have taken up automobile repair work and the sale of automobile accessories and supplies.

We also know that our readers do not see the regular automobile publications at all. They are located in country towns and you cannot conveniently reach them by means of salesmen. These blacksmith shops are not large, but in the aggregate their trade is a very important one.

The way to get this trade is use display space in the BLACKSMITH AND WHEELWRIGHT.

Will you let us quote you rates and give you full particulars? If we can only get your trial order for display advertising, our medium will talk to you more eloquently than any arguments we can possibly advance.

Please let us hear from you before you forget it.

Spring is the time to get results from our magazine. Don't delay!

All Fuel Can Be Used with

Gilson Firestone Carburetor

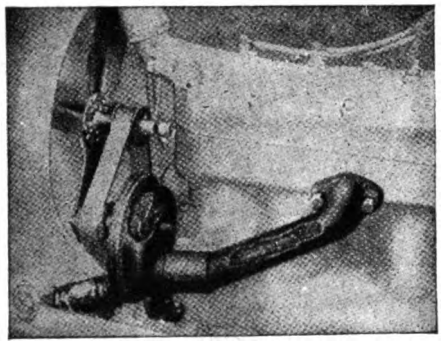
Burns Kerosene—Distillate—Alcohol—Benzine—Naphtha—Gasoline.

Not only gasoline but all other fuels can be used successfully with Gilson Firestone Carburetor. Especially designed for Ford, Maxwell, Chevrolet, Grant and Saxon cars. Only *one* adjustment is necessary—all other parts do their work automatically.

This carburetor is creating a sensation because of the expense that it saves. If your car has a Gilson Firestone Carburetor your fuel bill is cut 50% and your mileage is increased 33%.

30 MILES PER GALLON

With a Gilson Firestone Carburetor you will get 30 miles to the gallon of kerosene. Are you getting this mileage now? As kerosene is much cheaper than gasoline you can easily figure what you will save in a year. This carburetor will pay for itself in a few weeks.



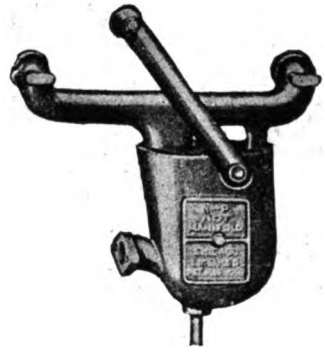
MORE POWER—MORE SPEED

With the Gilson Firestone Carburetor you will get 33% more mileage. Think what this means in saving to you. Your engine will have more power and more speed—will go up the steepest hills, through sand and mud or over rough roads. Investigate this money saver at once.

WE WANT LIVE DEALERS

The Gilson Firestone Carburetor is a whirlwind seller that is going big. Dealers everywhere are cashing in on this live proposition and are making big profits. *You* can make big money by selling them. Cable or write to us *today* for full particulars.
Retail Price F. O. B. Chicago for using kerosene including circulator, extra pipe line, complete, $30.00.
Retail Price F. O. B. Chicago for using gasoline, complete, ready to install, $18.00.

Centrifugal Water Circulation for Fords

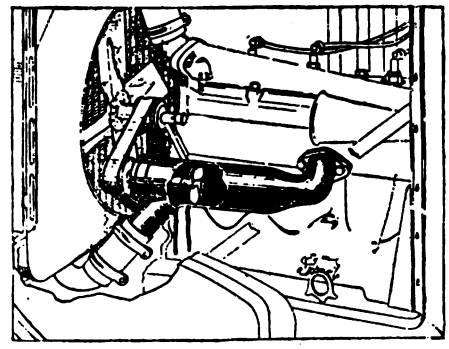


Places the Ford among the high-class cars. Keeps motor cool after several hours hard running. Saves its price in lubricating oil as a hot motor uses more oil than a cool one. Eliminates the pounding in your Ford motor when going through sand and mud, up steep hills or over rough roads. Retail Price, $9.00 F. O. B. Chicago, Ill, U. S. A.

Dealers

You better investigate this proposition at once. It means big money for you because this circulator sells on sight.

Firestone Manifold for Ford Cars



The Firestone Manifold for Ford cars keeps the heat around the inlet manifold—thus the fuel is vaporized *in* the inlet manifold. In this way, every bit of power is gotten out of the fuel and you get 15 per cent. more power. Install the Firestone Manifold and get 25 miles per gallon. Price, retail, $7.50 F. O. B. Chicago, Ill., U. S. A.

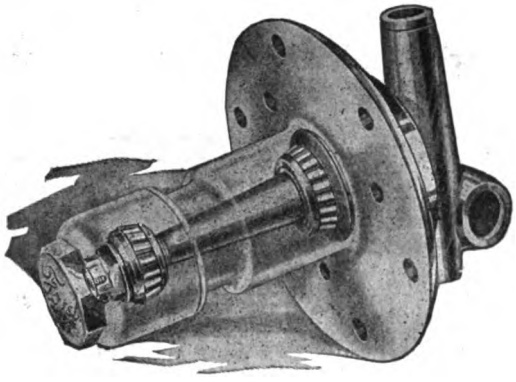
Dealers

Here's another article that is selling fast. Get the agency for this manifold and watch your profits grow.

G. P. Water Circulation for Ford Cars

The G. P. Circulator prevents the water from overheating in your Ford car. It does away with your heating problems. Keeps your motor cool and at the proper temperature at all times. This water circulator has proved itself the satisfactory one for Ford cars. Retail Price, $7.50 F. O. B. Chicago, Ill., U. S. A.

Dealers



Sell this Circulator and all your customers will be satisfied with it. It sells on sight. The easiest article you ever sold.

DEALERS—All of the above products are in big demand. They are easy to sell because they are all money-savers. Live dealers everywhere are making big money with all these articles. Send us a letter or cable today.

Wright Taper Roller Bearings on Ford Spindle

Showing Construction of Bearing. No Cage—Free Race—More Rolls. Strength and Wear Resistance at the Maximum.

Every FORD OWNER will soon ask for WRIGHT TAPER ROLLER BEARINGS

To replace the ball bearings on the front spindle.

Any repair man or dealer knows the annoyance Ford owners have from the breakage of balls in the present type of front wheel bearing. The Wright Taper Roller Bearing, which replaces the present bearing with no mechanical changes whatever, has large rolls to carry the weight and take the wear (14 in the small and 18 in the large) and thus stops front bearing trouble for all time.

THEY HAVE NO "CAGE"

Wright Taper Roller Bearings are based on a correct fundamental mechanical principle and have no cage or separating device.

Instead of this trouble-making part they have many more rolls to add strength and wear-resisting qualities to the bearing. Ford owners have been quick to see the saving and freedom from trouble gained by installing them. Once the bearing is shown the sale is easy.

Wright Taper Roller Bearings have a capacity of many times the load that the Ford can put on them, so add safety to driving. They should last as long as the car.

Dealers and repairmen, see your jobber for discounts. Car owners, see your dealer or write us for further information.

PRICE $10.00 Per Set (4 bearings)
IN CANADA $15.00

We Have Changed the Name

from the Any Auto Tractor to Guaranteed Tractor because the new name carries a fuller significance of our policy and the merit of our product.

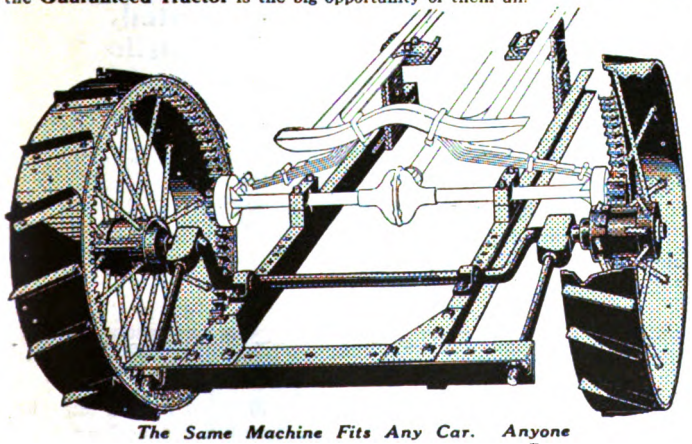
Makes a Tractor of ANY Auto!

$1,519,000 Worth in 7 Weeks!

THE biggest sales success in many years. A record unprecedented in tractor history. Absolute proof that Dealers recognize the broad sales field for this remarkable machine—the only attachment that makes a Tractor of any car.

Country's Biggest Dealers Join Us

The very first announcement brought thousands of requests for territory. Every territory closed has been taken by the largest, livest, most responsible automobile and implement dealers. The very name of these dealers—the sound reputation for business judgment of their executive heads—is ample warranty for any other dealer taking on the **Guaranteed Tractor.**



200% Larger Sales Field

The **Guaranteed Tractor** makes a powerful Tractor of **any model Ford, Dort, Overland, Chevrolet, Dodge, Buick, Studebaker, Maxwell, Reo, Velie, Saxon, Hupmobile, Oakland, Grant, Allen, Brisco and any other car.**

Its adaptability to any car gives dealers a sales field 200% larger than Ford attachments—a virgin field of 6,361,502 farms. And it is the fastest selling attachment in the Ford field, too.

"Bigger Than the Auto Industry"

LITERARY DIGEST says: "We face the dawn of an industry that will be as big or bigger than that of the automobile." "Biggest contribution to agriculture—greater than McCormick's invention of the Reaper in 1831—will work as sweeping revolution in soil tillage." The Tractor industry has arrived. With a market of 6,361,502 farms it must soon become one of America's giant industries. And the **Guaranteed Tractor** is the big opportunity of them all.

The Same Machine Fits Any Car. Anyone Can Attach or Detach it in a Very Short Time

Now a REAL Tractor!

Vital engineering improvements which positively insure efficiency in the field.

A highly developed cooling system—an air cleaner that strains the air of all dust—perfect traction in all soils—36-in. wheels with 10-in. tires—and 34 other features that make **Guaranteed Tractors** the leader.

The auto does no pulling—it is pushed ahead. The **Guaranteed Tractor** simply converts speed-power into pulling power by a gear reduction of 11 to 1. There is no strain on the engine—it starts and runs continuously on high gear.

The automobile engine as a tractor is proving itself highly efficient on thousands of farms.

4 to 8 Horse Work

If the farmer uses a small car of 20 to 25 H. P. he gets 4 horse work. With a larger car of 30 to 60 H. P. he gets 6 to 8 horse work.

He can do all farm work with **Guaranteed Tractor 69% cheaper** than with horses—one-half cheaper than standard tractors. Save $225 on every 112 acres plowed. Save $800 on every 80 acres plowed, disced and seeded. Save the wages of two men on every 80 acres plowed. Yet it costs but the price of one good horse.

New Dealer Plan—Rush Coupon

Territories are closing rapidly. The season is on. Our big sales plan makes it important that every dealership be closed immediately.

Automobile dealers must get in the tractor line to make big money.

Rush coupon or wire for territory reservation and big new dealer proposition. Learn why the foremost dealers are joining us daily.

The DEFENDER AUTO LOCK
For Fords
Discourages Thieves

Thieves take the cars it is easiest to steal—and there are enough of them standing at curbs, inadequately protected, to furnish $1,000,000 worth of booty in one moderately large American city in 1917.

The DEFENDER Auto Lock discourages thieves, because it double locks Ford cars. The tinkering and time it would require to beat a DEFENDER Lock—if, in the end, it could be beaten—would arouse so much suspicion that the thieves would never make a get-away. Thieves know this. **They pass up DEFENDER Protected Fords,** and take the cars it is easiest to steal.

It Sells for Its Five Protective Points

I
Locks and protects coil units with hardened steel band. (Patent pending.)

II
A beautiful, polished solid aluminum casing; locks over switch. (Patent pending.)

III
Operates against the ignition by special grounding device. (Patent pending.)

IV
Guaranteed for the entire life of car, and backed by a company fulfilling every sound business principle to the last ditch.

V
Recognized and used as a standard of perfection by insurance underwriters and saves 15% on insurance.

DEALERS—Write for free illustrated literature and complete details.

Make Your Car Safe When You Back Up at Night

KING-BULL MANUFACTURING CO. KING Safety Tail Light CHICAGO ILLINOIS

Mail Check or Money Order with Coupon

$6.00

f. o. b. Chicago

$6.50 West of Colo. $9.00 Canada

Motorists, you need the King Safety Tail Light. It is the *best* and *cheapest* insurance against accident when backing at night that any motorist can buy. With it, on your car, you have a light as clear as day back of your car when you back at night.

The King Safety Tail Light was developed as a result of a car backing over an embankment at night.

It is just as necessary to light the rear of the road when backing up as it is to have headlights on when going forward. You should not drive your car without equipping it with this remarkable Safety Tail Light.

The King Safety Tail Light replaces any single or double contact tail light that is electrically controlled. The search light is controlled from a switch located to suit the convenience of the driver and the regular tail light are in one compact lamp.

Search light can be turned on or off at will. Search light throws a clear white light 50 feet back of car and the full width of the widest road. Two bulbs, one for the search light and one for the regular tail light are furnished; also a bracket to fit any car and an independent switch.

Lamp is durably made of cold rolled steel, neatly finished in baked-on black enamel.

Protect yourself, family and car now by buying the King Safety Tail Light. *It is guaranteed to give satisfaction.*

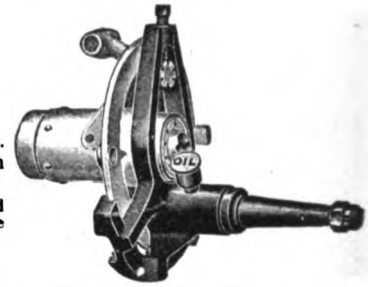
EMERGENCY AXLE STUBS FOR FORD CARS AND OTHER CARS

Emergency Axle No. 1

Emergency Axle No. 2



These devices are for bringing in cars with broken axles. With either type of axle, a car can be placed on its own wheels within a few minutes time.

The No. 1 and No. 2 axles require an extra front Ford wheel and cones, while the No. 3 uses the rear wheel and has a compression grease cup to prevent it from getting hot.

Nos. 1 and 3 are for Ford Cars.

No. 2 is for all other makes of cars.

List Prices: No. 1, $5.00; No. 2, $10.00; No. 3, $6.00

Emergency Axle No. 3

Portable Work Bench

PORTABLE WORK BENCH & ENGINE STAND

It is provided with two large trays, 22x24, for convenience, where the workman can place his tools, motor, and axle parts. The stand is mounted on three 4-inch diameter wheels. The rear castor wheel is so constructed that by pulling the plunger jim, the castor will swing up off of the floor and the stand will then rest firmly on its legs. By kicking the castor lever down, the stand will go back on its wheels and lock automatically.

A Ford assembly can by fastened to the stand the same as with our Motor Stand.

The Work Bench is also equipped with a machinist's vise, which has a 3-inch jaw with a 4-inch opening, which will handle any work required in overhauling a Ford motor or axle, also other kinds of work.

The Work Bench & Engine Stand is 36 inches high, 27x42 inches floor space.

Weight, 120 lbs. **List Price, $40.00**

MOTOR STAND

The handiest device of its kind for use in shops and garages doing Ford engine work. The Ford motor when taken from a car can be fastened to the stand by the two cap screws which screw into the side of the motor where water inlet connection is fastened. The stand is so constructed that the part screwed to the motor will revolve in the clamp on the stand and can be locked by tightening the lock-screw which will hold the motor in any position or angle desired to suit the workman. It also has a tool tray where the workman can place his wrenches or parts of the motor, if so desired. It is mounted on wheels so it can be moved from place to place. It is 34 inches high; 32x30 inches floor space.

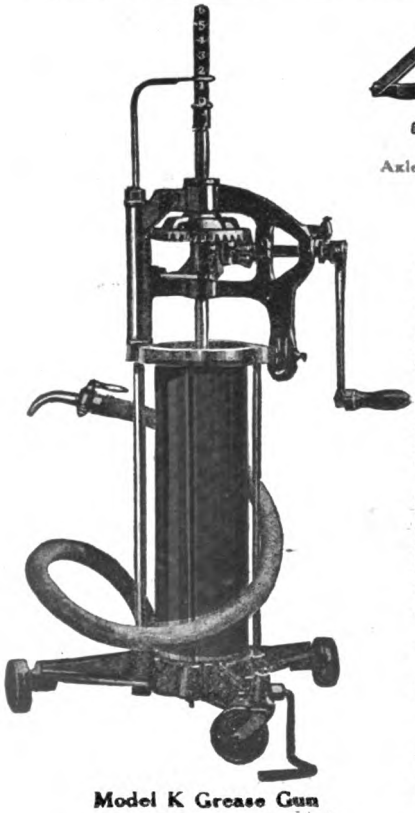
Weight, 50 pounds.

List Price, $20.00

Motor Stand

Axle Attachment

AXLE ATTACHMENT



The attachment is for use on either our Portable Work Bench & Engine Stand or our Motor Stand.

By merely bolting this Attachment to the revolving part of the stands, it quickly converts them into axle repairing stands for repairing nearly all makes of automobile axles.

Weight, 9 pounds. **List Price, $6.00**

Axle Attachment

Model K Grease Gun

PORTABLE GARAGE GREASE GUN

Consists of a heavy seamless steel cylinder mounted on wheels, has five feet of hose attached to bottom of cylinder, with shut-off valve and nozzle at end of hose.

Register measures accurately the amount of grease put in the gear case or differential, and will work equally as well on liquid oil as on hard grease.

It is equipped with two sets of gears. When the crank is pushed in, it disengages the low gear and immediately engages the high gear which operates the piston either up or down at a high speed. To shift back into low speed, merely pull plunger and pull crank outward which engages the low speed gears.

The cylinder is 20 inches long by 6 inches in diameter, capacity 20 pounds of grease or 2½ gallons oil. The piston is covered with best quality cup shaped leather and is provided with an expansion ring in piston which prevents any grease or oil from leaking by. The piston also has an automatic air vent which releases the vacuum in the cylinder when cranking the piston up for refilling. The base is provided with a step-lock which lifts the castor up off of the floor and sets the gun rigidly while cranking.

To operate: Pull plunger and push crank in which engages quick return gears, turn crank to left until piston comes up out of cylinder, then pull plunger and swing head over to one side. Fill the cylinder with grease or oil, swing head back over cylinder, turn crank to right while high speed gears are engaged until piston reaches the grease in cylinder. Then pull plunger over crank shaft, pull crank outward, which will engage low speed gears, then set register by pushing down indicator to zero, then turn crank until you have the amount of grease desired. The register will show the exact amount of grease put in the gear case. The register can be reset at any time desired by pushing the indicator rod down to zero. When grease is used it registers in pounds and when oil is used it registers in pints. The same register is used for grease and oil.

Model K provided with a set of quick return gears and can be refilled in one minute.

Weight, 100 pounds. **List Price, $47.50**

ANNOUNCING THE ESTA WATER AUXILIATOR

An Accessory that eliminates carbon by preventing its formation, giving *more power, more speed, and using less gasoline*

TESTED AT

THE AUTOMOBILE CLUB OF AMERICA
THE PRATT INSTITUTE OF BROOKLYN

Digitized by Google

WHAT

WHEN an automobile comes from factory, its motor is clean. It develops, after a few hundred miles, the fullest power. From that point on, it develops carbon.

There are only two ways of overcoming this difficulty. One is to take the engine down at regular intervals and either scrape the carbon out of the cylinders by hand, or burn it out with oxygen. The other is to install an Esta Water Auxiliator so that the carbon may never accumulate — to burn it out *as it is forming*.

HOW

THE Esta Water Auxiliator—a handsome, polished, cast aluminum tank that goes under the hood on the back of the dash of any passenger car, truck or tractor—introduces a cleaning element of oxygen in the form of damp air. It carries this oxygen into the explosive charge that is entering the cylinder—ensuring the absolute combustion of every particle of fuel and burning the carbon as it is being deposited. It cleans a dirty motor—and keeps a clean one clean. It means the economy of greater speed and more power and less fuel.

WHY

THE principle of the Esta Water Auxiliator is old as the hills. It is the very same principle that makes the fireman turn a hose on his coal to prevent the formation of soot (carbon) in the flues. And the new Esta application of this principle is as simple as the principle itself.

It works as naturally as a human being breathes. Just as oxygen burns up impurities in the lungs, so does it burn up impurities in a motor—while combining with the gasolene vapor to give the necessary heat for the expansion of the gases and the driving of the engine. Gasolene is a light hydro-carbon. Lubricating oil is a heavy hydro-carbon. The Esta Water Auxiliator introduces an additional element of oxygen in sufficient quantity to increase the strength of the explosive charge and to burn the carbon element, which is otherwise left isolated.

QUOTATION FROM THE CERTIFICATE

OF THE AUTOMOBILE CLUB OF AMERICA

"AS regards the removal of the carbon from the cylinders of an engine, the saturated air made the carbon to form in flakes which did not adhere tightly to the walls of the cylinders and piston heads and therefore could be easily carried away through the exhaust along with the gases."

"A motor, the cylinders of which are full of carbon, will lose power and speed as well as require a greater amont of fuel consumption over that of a clean one, but this loss can be regained with the use of the Auxiliator so that the speed, horse power and fuel consumption will be the same as that of a clean motor."

Digitized by Google

THE Esta Water Auxiliator is a new accessory well calculated to meet a new national condition. People are talking and practicing economy and efficiency as never before. The Esta Water Auxiliator gives economy and efficiency to motoring as never before. It is an economy in perfect tune with the times.

More than that, it is an accessory capable of multiplying a smaller profit many times over to help offset the absent profits from the sale of new cars, which the manufacturers are not producing at the factories.

It can enable an organization—in this period of new adjustment—to show a profit on its sales force, to hold that force together, and to look about and come in contact with the owners of every make of car.

The Esta Water Auxiliator is an accessory which people are in the mood to buy and to talk about to others. Every installation means an advertisement for you which is limited only by the driving radius of the car equipped.

We are now working out our plan for distribution. Quick action on your part practically means that every single car owner in your territory is a prospect. To become known *now* as the Esta dealer in your district means cashing in to the full on 20,000 dollars worth of consumer advertising in the Saturday Evening Post this spring.

Write to us today for profits. The next page makes it easy for you.

How Automobile Dealers can MAKE MORE MONEY

"A shortage in new cars and an increase in the use of used cars means that there is a large proportion of vehicles in use which will need new equipment. A large percentage of these cars may need a thorough overhauling—work for the repair department. Some may have been made in the era of high grade gasolene, and will require an adjustment enabling them to digest modern fuels—work for your equipment department. All will probably need accessories or attachments of some kind—work for your accessory department.

"In fact, the increased demand for tires and all kinds of accessories needed to bring a used car up to date, or to keep it in running condition, should induce you to increase the business for your supply department to the point where it will show as great a profit as was the case with your passenger car department. Keep on the lookout for new accessories. Add each one to your stock as you feel it will meet the requirements of the motorists in your territory and then *sell* it. Select only those which actually add to the efficiency of car operation, or to its utility. In other words, be able to prove to the owner that every accessory which you handle will pay for itself in a short time, either through its actual saving in cost of operation, or through the increased comfort and safety afforded the car or its occupants.

"Just as this war is showing the world at large the strength and stability of the automobile industry, so should present-day conditions be made to demonstrate the business ability of that great backbone of the industry, the dealer organization."

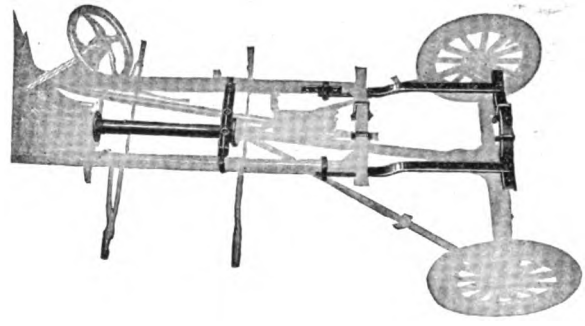
HAY-DEE EXTENSIONS

$55—for Fords—$60

"We WILL Conquer"

"Say Al, you look all down in the mouth!"



"I sure do! Every Ford dealer is up against it, good and strong. Can't get deliveries! Ford is doin' all he can, but that don't help my customers — there're howling!"

"Why don't you wake up? Instead of sittin' down and moanin', go over your old sales list. Get out and tell some of these fellows, this war means more than joy ridin' now—you've got to have cars to rebuild for commercial purposes to keep business movin'!"

"How are y' goin' to do that? Say, listen, do you believe in signs? Look at that sign up there!! By that sign Ford dealers will conquer."

"That Hay-Dee Extension is the greatest proposition on the market today. A wrench and a hammer, not a cut or a hole, and you can make a big delivery car out of any ol' Ford. Y' get 8 to 12 feet of loading space, never touch the engine or the frame—better than ever! Get busy, write Hay-Dee today. It's a life-saver for us!"

"Thanks, ol' man, I'll write 'em now, for the "dope sheet."

Guaranteed for
10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

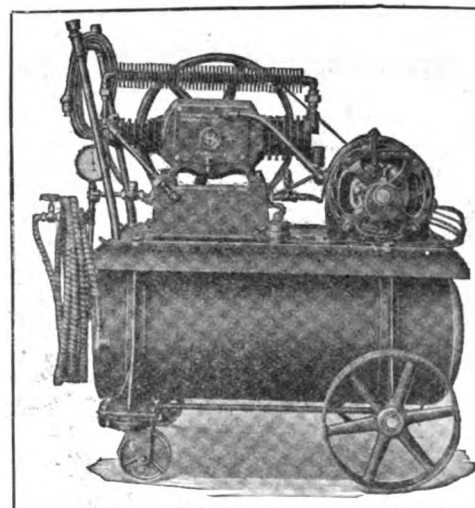
The U. S. De Luxe Automatic Air Unit

utilizes the principle of **Two Stage** operation and is without doubt the most efficient air compressor in existence—the ideal unit for free air stations, garages and tire shops.

The De Luxe proves a business getter wherever installed. Many of the better garages contain this outfit and several companies of national prominence use it as standard equipment.

Capacity 4 cubic feet per minute. Contains 14 points of excellence.



U. S. Two Stage Compressors

without tank, motor or controlling equipment can be furnished if desired, having tight and loose pulleys as illustrated or large single wheel for direct motor drive. Capacities 4, 10 or 20 cubic feet per minute.

The United States Line

comprises 20 different numbers in **Two Stage** and **Single Stage Types**, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.

U. S. Portable Compressor No. 35

has capacity of 4 cubic feet per minute and utilizes the **Two Stage** principle to which the remarkable success of U. S. compressors is due.

The high efficiency of this unit is particularly desirable as ability to get immediate results is more necessary in a portable than in any other unit.

Equipment 35 is also extensively used in individual plants for blowing dust from motors, generators and other machinery.

UNIVERSAL BATTERY COMPANY

3420 S. La Salle Street CHICAGO, ILLINOIS

Makers of Universal Starting and Lighting Batteries. A complete battery for every popular make of car and a repair part for every standard make of battery. Also manufacturers of vehicle plates and parts for both pleasure cars and commercial trucks.

DONT BUY UNTIL YOU SEE THE NEW YORK

SECURITY SWITCH LOCK

A glance will tell you that it is BETTER MADE, simpler to install, gives greater protection and sells quicker than any other Switch Lock made.

A STRONG METAL HOUSING completely covers present switch. Note that screws and screw holes are always covered by steel bars.

When key is removed, entire Ignition System is grounded, baffling the most expert thief as wiring "around coils" or even applying separate battery avails him nothing.

Magneto, battery current, or both may be used just the same as before Switch Lock was applied.

It fits on either old style (moulded) or new style (all metal) Switch. Your present switch is not disturbed. Wires and attaching bolts remain just as they are at present.

With these many super-features, the price is less than others—**$3.25** Complete.

DEALERS—This is the Switch Lock you will handle after receiving further particulars.

The Perfect Gear Lubricant

FOR TRANSMISSIONS AND DIFFERENTIALS

Less Required—
Lasts Longer

Will Not Run in Hottest Weather—
Will Not Freeze in Coldest Weather

EVR-LASTIN is truly a remarkable product—unequaled for transmission, differential bevel, spur or worm gears. It forms a protective coating that will not run or gum—sticks to metal under the worst strains and pressure—preventing wear and assuring perfect lubrication. Cures leaky differential troubles—eliminates grease working into the brake-bands.

TRADE ***Evr-Lastin*** MARK

GEAR COMPOUND

It is only necessary to pour one-third the quantity of ***Evr-Lastin*** into the gear housing, that you would oil or grease. This means a big saving in money to you—furthermore under actual test, ***Evr-Lastin*** proves to last three to four times as long as transmission grease or oil.

Furnished In Any Quantity

Evr-Lastin comes in 5, 10, 25 and 50-lb. tins—also in 225 and 400-lb. barrels. Dealers will find that ***Evr-Lastin*** will more than please their customers, and will be a big money maker. Be sure and get our proposition.

Hang on to your old tires. They will last as long as you live if covered with steel. The Kimball Steel Protector makes Blowouts, Punctures and Rim Cuts impossible. A few sections will hold any old blowout. Tires as flexible as ever.

Special inducements to those in new territory.

MUD CHAIN can be put on in a jiffy with one hand while standing on the run board. If you get in a mud hole you will laugh out loud. Hook the ends together and pull the lit-le lever and they are on tight. Good for blowouts.

KIMBALL TIRE CASE CO., 174 Broadway, Council Bluffs, Iowa

THE RED ROAD BOOK

250 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 153 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of April.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

The Kerosene Equipment consists of: Kerosene Carburetor (patent pending). Intake Manifold with drying chamber, all Tubing and Couplings, 1½ gallon Gasoline Tank 18x5½x3 (to be located under floor board, used for starting).

Price $25.00
Cash with order f. o. b. Detroit

Absolute Guarantee
If returned within a month—Money Back

Anyone Can Install It

Extract from letter from H. Wolpers & Co.
Dealers in Dry Goods, Carpets, Wall Paper, Shoes, etc.
Germantown, O.
Dear Sirs: Jan. 5, '18
We received pour carburetor. It works fine as can be. We have worked up some excitement with it here.
We would like to know what territory we can get on pour proposition, for we can sell them.

One gallon of Kerosene should give an average of 25 miles, depending on the condition of your engine.

This equipment accomplishes what has heretofore been claimed and hoped for of so-called Kerosene Carburetors.

It completely breaks the fuel up into atoms, pre-heats it, then dries the gas before it enters the cylinders.

Kerosene Equipment Company
Successors to Detroit Kerosene Carburetor Co.

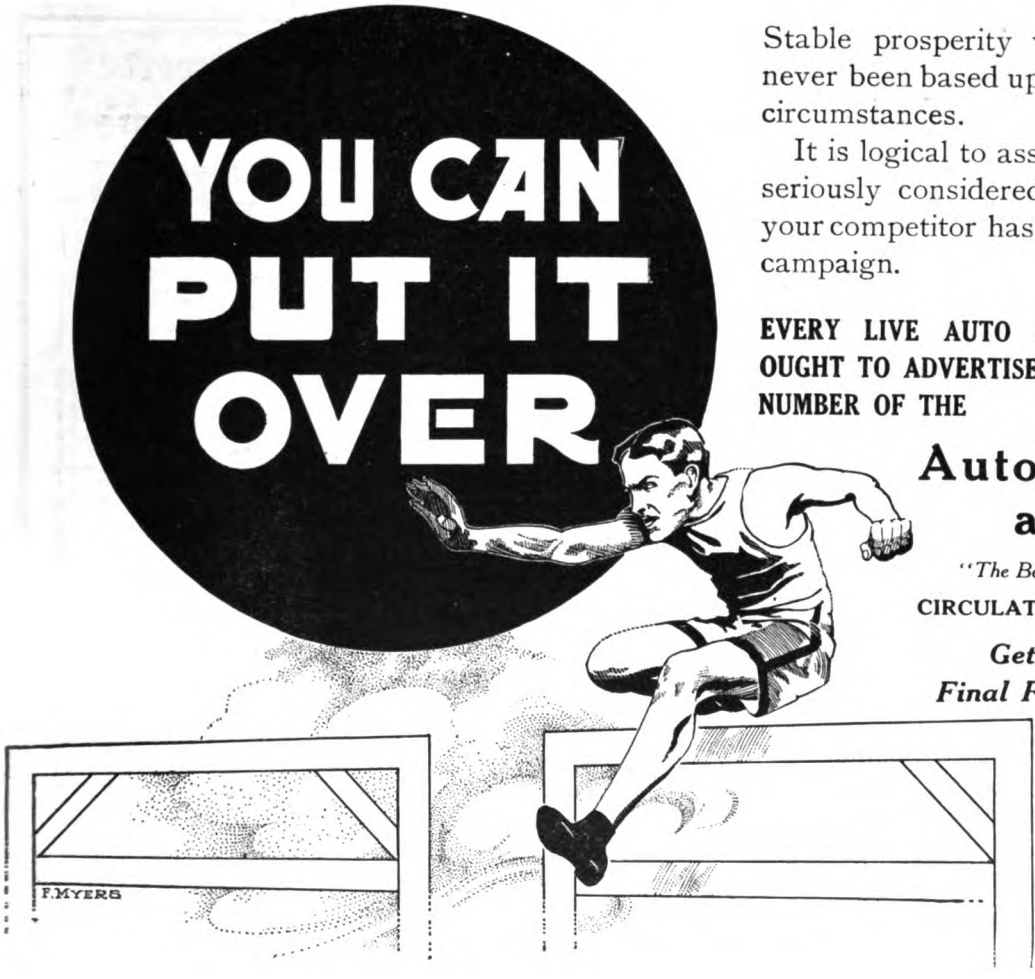
You Can Make Big Money

Recharging Auto Storage Batteries—

HB 500-Watt Equipment Means Quick Charging and Big Profits

The demand for battery charging will be bigger than ever this year. Decreased production of pleasure cars means more old cars kept in service, more batteries that must be recharged, and more business for the man in the garage. The time to get ready for *big business* this spring is *now.*

The HB 500-Watt Battery Chargers are making $40 to $60 a month extra profit for hundreds of owners. Recharges 1 to 7 batteries at a time with current cost of 12c to 15c per battery. Autoists pay 75c to $1.50. At least $4.50 profit each capacity run. City current operates. No electrical or mechanical experience necessary. *Big profits quickly made.*



$15 Puts This Money-Maker in Your Garage

Balance in 8 monthly payments of $20 each, which earnings should easily more than pay. Tear out this ad and send it with name for full particulars, or send initial payment of $15 with trial order. *No risk. Absolute money-back guarantee.*

HOBART BROTHERS COMPANY
Box D4, TROY, OHIO

Put in an HB Battery Charger and be prepared for *big business* and *big profits* this spring. *Do not delay.*

Stable prosperity wherever manifested, has never been based upon incidental or haphazard circumstances.

It is logical to assume, when the matter is seriously considered, that the "good luck" of your competitor has resulted from a promotive campaign.

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are **50 Instructions**—Simplified and practical.

3500 **Illustrations** - the kind you understand at a glance.

3 **Supplements**, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD** —tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 Illustrations and 279 pages on **Electric Ignition, Electric Starters** and **Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on **Repairing.** Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on **Tires and Tire Repairing.**

44 pages and 119 illustrations on **Carburetion.**

89 pages and 291 illustrations on **Engine and Parts.**

16 pages on **Digest of Troubles.**

6000 lines to the **Index.** This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins** on colored paper, easy to refer to.

Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS

TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician

The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine —then the variance of construction — then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three – or four books?

Mr. Dyke published the first practical Automobile Book in America.

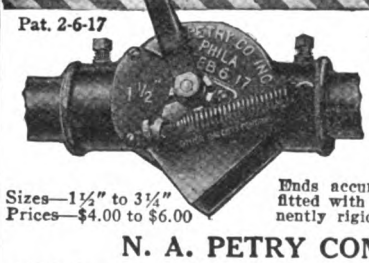
FORGET CARBON
Don't waste time and money temporarily removing carbon.
Prevent it altogether by removing the cause.
Stop oil leakage.
PRESSURE PROOF PISTON RINGS
Will do this—and do it so thoroughly that you'll forget there is such a thing as carbon. They will also give your motor added compression and pay you big dividends in oil and fuel saved.
PRESSURE PROOF PISTON RING CO.
169 Massachusetts Avenue
Boston, Mass.

PISTONS
FOR THE
FORD
Made of a Close Grained GRAY IRON. Perfectly ROUND AND GROUND TO SIZE.
Fitted with PINS, BRONZE BUSHINGS AND STEP CUT RINGS.
ASK YOUR JOBBER FOR THE DYER Quality Piston, or Order Direct.
WE HAVE SEVERAL HUNDRED PATTERNS OF PISTONS FOR DIFFERENT MODELS OF ENGINES.
THE G. H. DYER COMPANY, Cambridge, Mass.



PERFECTION MULTIPLE PISTON RINGS
The valuable feature of our PERFECTION PISTON RING is to save expense of re-boring cylinders and fitting new pistons when the engine has failed to work properly. They will work in old cylinders where all others fail. They are easy to apply and cost less than any patented cast iron ring. Try them and prove it.
Dealers Wanted. Write for prices and discounts.
Manufactured by AMERICAN PISTON RING CO., 3-5 East German Street BALTIMORE, MD.
N. A. PETRY CO., Inc. 1309 Race St., Philadelphia, Pa. Eastern Representative, North and South, East of Denver.

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table" on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:
MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

Just a Pull of the handle of
The Simplex Starter

Jewell BATTERY GAUGE

The Ever Watchful Guardian of Your Battery

PRICE $5.00

A fire alarm that would tell you your house had burned by testing the ashes would get mighty little consideration,—yet that is about the size of a semi-monthly hydrometer test of your storage battery.

The JEWELL Battery Gauge warns you instantly "at the first indication of smoke and long before the fire begins."

You do not have to test or even investigate, the information is constantly before you, as easily read and more accurately told than the story of your speedometer.

The most valuable accessory ever put on a car.

Digitized by Google

A HALF century of experience manufacturing brake linings has taught us that the secret of braking safety, efficiency, and durability lies in the kind of asbestos fibre used. We put only selected fibre from our own mines into NON-BURN—that's why it wears—and sells.

Digitized by Google

MANVILLE

NON-BURN ASBESTOS BRAKE LINING

Brake lining like this is a repair man's good-will builder

PEOPLE bring their cars into your shop the first time because they are in trouble. And they come back or they don't, depending on the impression they get of you and your service. As a rule your customers are not mechanics —they cannot inspect and recognize a good mechanical job—but they expect a job to last. And it is just like that when you reline brakes.

Perhaps you can put over *any* lining but you don't want to because it is not good business. Non-Burn on a customer's bill flashes quality to him and he thinks a lot more of you as a service man because he knows about Johns-Manville and asbestos. He has read the asbestos pedigree of Non-Burn in hundreds of advertising stories and you capitalize on all this good-will when you sell this lining.

Now go a step farther—not only install Non-Burn but sell it by talking it—because there is a good profit in it. Perhaps it is natural that Non-Burn quality should be reflected in the policy under which it is sold—the fairest and most liberal sales plan we could devise. Non-Burn is distributed strictly through regular jobber-dealer channels. Discounts are generous, rigidly maintained and uniform, regardless of quantity—permitting rapid turn-overs and protecting your profits. Details on application.

SOME of these big advertisements have already appeared in such magazines as SATURDAY EVENING POST and LITERARY DIGEST. They occupy pages and half-pages. They are running practically once a week. They are being read by millions of car owners. They are selling Enamel.

We know Da-cote to be the best article obtainable by a car owner who plans to paint his own car. It flows on smoothly without leaving brush marks. It dries over night. It has a hard, glossy, durable, elastic surface. It will please every owner who tries it, both for looks and wear.

Order a 16 gallon assortment. Get our brilliant and novel window displays. Use our dealer electros and other aids in selling. Our salesmen will explain.

Profits are big. Demand is urgent. Sales are easy. Customers are satisfied.

Murphy Varnish Company *Franklin Murphy, jr., President* **Newark, N. J. Chicago, Ill.**

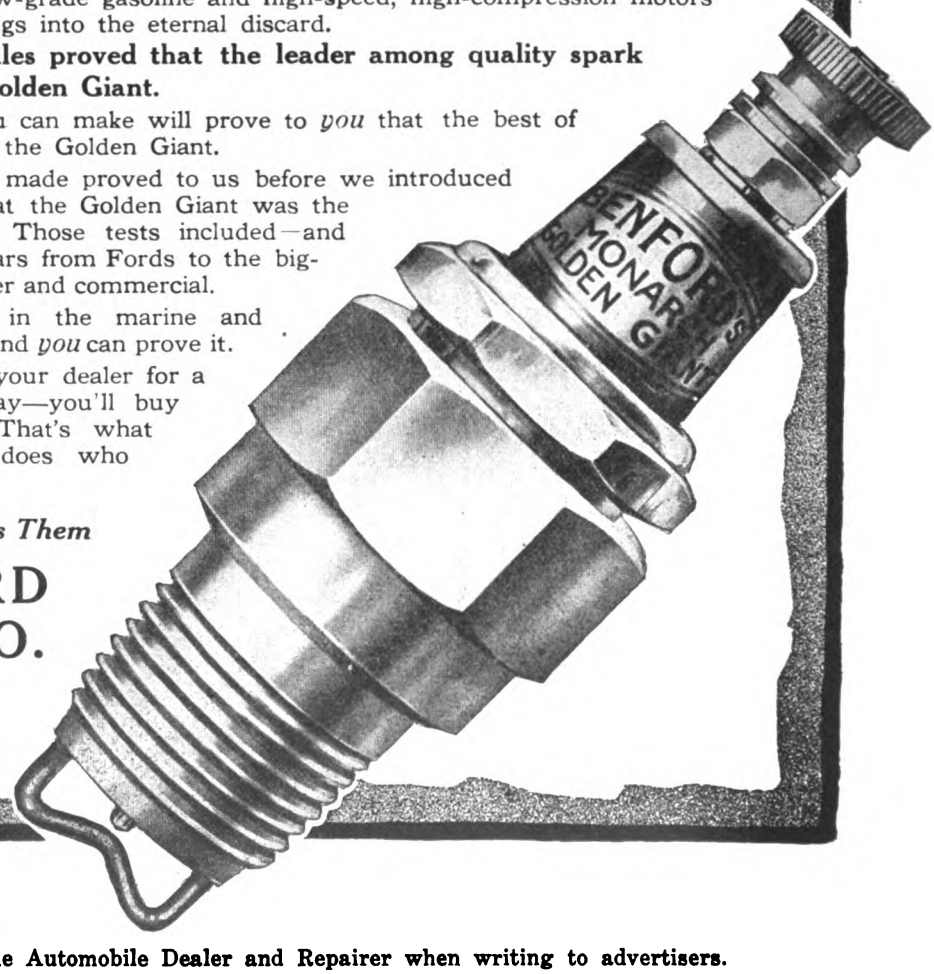
BENFORD'S GOLDEN GIANT

Watch the Bunghole First

SUPPOSE you *do* save a nickel on a spark plug? Is it a *real* saving? Some people think they save time by stopping a clock. It can't be done. "Saving at the spigot and wasting at the bunghole"—we wrote that in our copy-books, you and we, years ago. Did we learn the lesson?

A cheap spark plug is always *cheap*. It's only a business accident when you can buy an article at less than its worth.

Buy the best—for only the best will do in modern motors. When gasoline was so good that it would explode on suspicion, perhaps "ornery" plugs were all right. But low-grade gasoline and high-speed, high-compression motors have put junk plugs into the eternal discard.



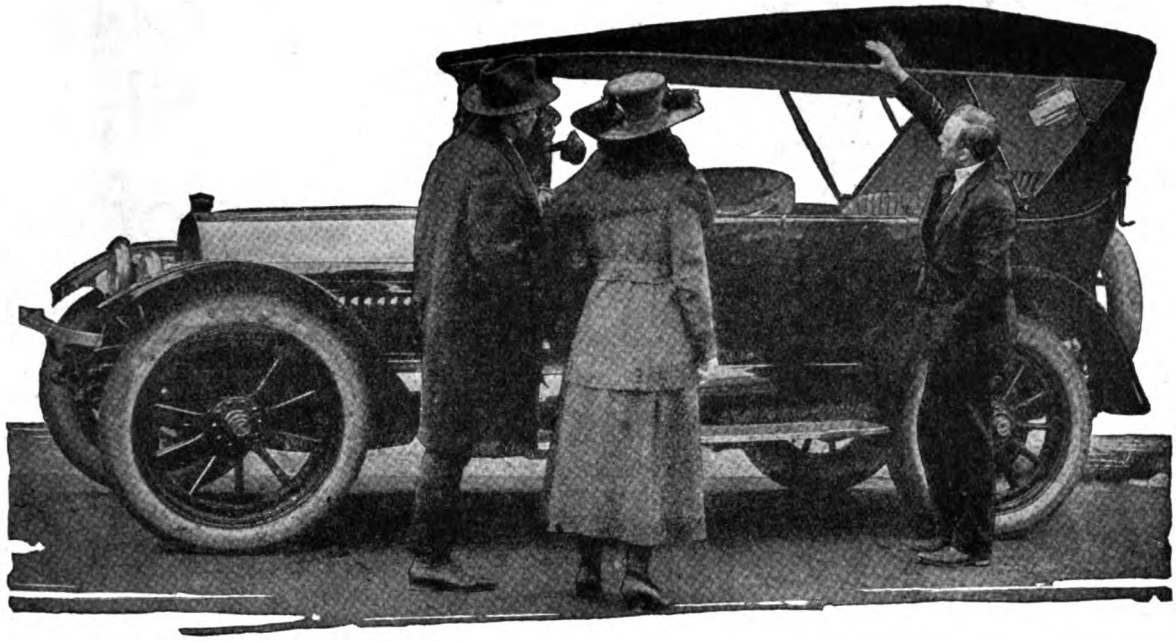
Last year's sales proved that the leader among quality spark plugs was the Golden Giant.

Every test you can make will prove to *you* that the best of all spark plugs is the Golden Giant.

Every test we made proved to us before we introduced it—and *since*—that the Golden Giant was the best spark plug. Those tests included—and still include—all cars from Fords to the biggest, both passenger and commercial.

It leads also in the marine and motorcycle field—and *you* can prove it.

How? Ask your dealer for a Golden Giant today—you'll buy the set later. That's what everybody else does who makes the trial.



Your Dealer Has Them

Manley 22-Ton Garage Presses Make Short Work of Long Jobs

Every Garage needs a Manley Press, especially for those obstinate time-wasting jobs—the kind of jobs that eat up so much time you frequently hesitate to charge for all that was actually put in on the wor!. That's the reason why the "hardest" jobs are usually the least profitable in repair work and why a Garage must be equipped with a Manley Press to satisfy its customers.

Manley Presses were designed especially for repair work of this nature. Their many exclusive features are practical advantages that adapt them for garage work and insure them being time savers and money makers.

Universal Auto Press	No. 1 Garage Press	No. 2 Garage Press
PRICE	PRICE	PRICE
$66.00 Net	$64.50 Net	$47.75 Net

Auto Bench Press is the top half of the Universal Auto Press. Price $39.00 net. Bottom half may be purchased at any future time, converting it into the regular Press.

Four Sizes to Choose From

Doesn't it stand to reason that one size Press cannot satisfy all Garage Requirements? From the Manley Line of four different sizes you can select the particular Press that fits your work to the best advantage.

See the Exclusive Features You Get When You Buy A Manley Press.

Look around and satisfy yourself that no other press has them. Features which are practical and absolutely necessary in a Garage Press if it is to handle every job from the smallest to the largest in the shortest time with the least effort.

High Speed Sensitive Leverage of 1000 to 1 for light work, quick—saves time, effort and damage to work.

High Power Leverage of 2200-5000 to 1 for heavy work—powerful—gives tremendous pressure. Change in leverage instantly made—no bolts to remove.

42 in. Clearance (Universal Auto Press) takes in every piece used on automobiles.

Tables instantly adjustable on pins. No bolts.

Tables have wide surfaces to properly support the work.

Screw 2 in. diameter, 4 pitch Acme thread, 12 in. travel and does not revolve.

Channel Blocking is braced.

"V" Face Plate automatically adjusts itself to any size shaft on hub.

Bolted Construction, possible to admit a frame, etc., under screw.

Screw Exposed at the top may be struck a blow in extreme cases when pressure alone fails.

Test Centers equal to a special straightening Press. (For a few dollars extra.)

Makes a Perfect Permanent Repair

6 Round Patch & Heat Units for Punctures
Additional Supply 75c per dozen

Complete Outfit $1.50

Includes

12 Patch & Heat Units

6 Oblong Patch & Heat Units for Cuts and Tears
Additional Supply 75c per dozen

The Patch & Heat Unit consists of a chemically treated combustible disc on one side and a pure para rubber patch on the other. This fits over the puncture and a match is applied to the chemical disc. Without blaze or flame this disc furnishes the proper heat, which seals the cut in the tube with the new rubber, making a permanent **repair.**

The Patch & Heat Unit is all ready to clamp on the tube. The fuel in its metal container and the rubber patch itself are all assembled. No different parts to lose or complicated application to the tube. Simply put the unit over the puncture, clamp **it down and apply the match.**

SHALER

5 Minute Vulcanizer

The fact that over 500,000 motorists are now using the SHALER 5-Minute Vulcanizer is convincing proof of its ever-increasing popularity. Every motorist is a prospect for one of these handy tube vulcanizers—it should be in every car owner's tool kit—for use anywhere—on the road or in the garage.

Sell the SHALER 5-Minute Vulcanizer. Every sale of a 5-Minute Vulcanizer gives you a good profit. Besides, the big resale of patch-and-heat units furnishes you a continuous profit—it brings motorists to your place for SHALER supplies—and for all sorts of other accessories.

The SHALER 5-Minute Vulcanizer with 6 Round and 6 Oblong Patch & Heat Units packed in attractive display carton.

ORDER FROM YOUR JOBBER *NOW!*

Don't delay! The enormous demand for this popular vulcanizer makes it necessary to place your order early if you want to be sure of prompt shipment. Any jobber in the United States can supply you. Our large catalog describes the complete line of SHALER Vulcanizers for motorists' use—also complete equipment for garages and tire repair shops. Mailed free on request.

UNCLE SAM'S

Latest Assistant
The Miniature

THRIFT BANK

Is designed to sell U. S. THRIFT STAMPS automatically

Deposit your quarter savings and get receipt—A Twenty-five Cent Thrift Stamp.

These new miniature Thrift Banks will soon be found wherever Thrift Stamps are sold by authorized agents, for they save time in selling and accounting and actually increase the sale of stamps.

They require no attention other than to keep them filled with the special roll form of United States Thrift Stamps, that may be had in amounts of fifty or one hundred stamps.

Simply deposit a quarter, turn the crank and a Twenty-five Cent Thrift Stamp is delivered in clean sanitary form and the transaction is recorded.

All coins, other than quarters, are returned to the user and will not operate the bank.

These handsome all metal and glass devices are substantially made, mechanically perfect, small in size and light in weight. May be placed in use anywhere and locked in place if you wish.

These banks are loaned at a cost to you of less than four cents per day.

Your order for one or more of the banks may be placed direct with us.

Why—

IT'S MONEY in your pocket when you can establish a reputation for rapid service among car owners in your neighborhood.

That is one reason why you should push Harvey Springs

Besides rapid service, the product you sell must be of good quality, honestly made.

That is another reason why you should push Harvey Springs

A product that has made a name for itself and has gained the good will of car owners is much easier to sell.

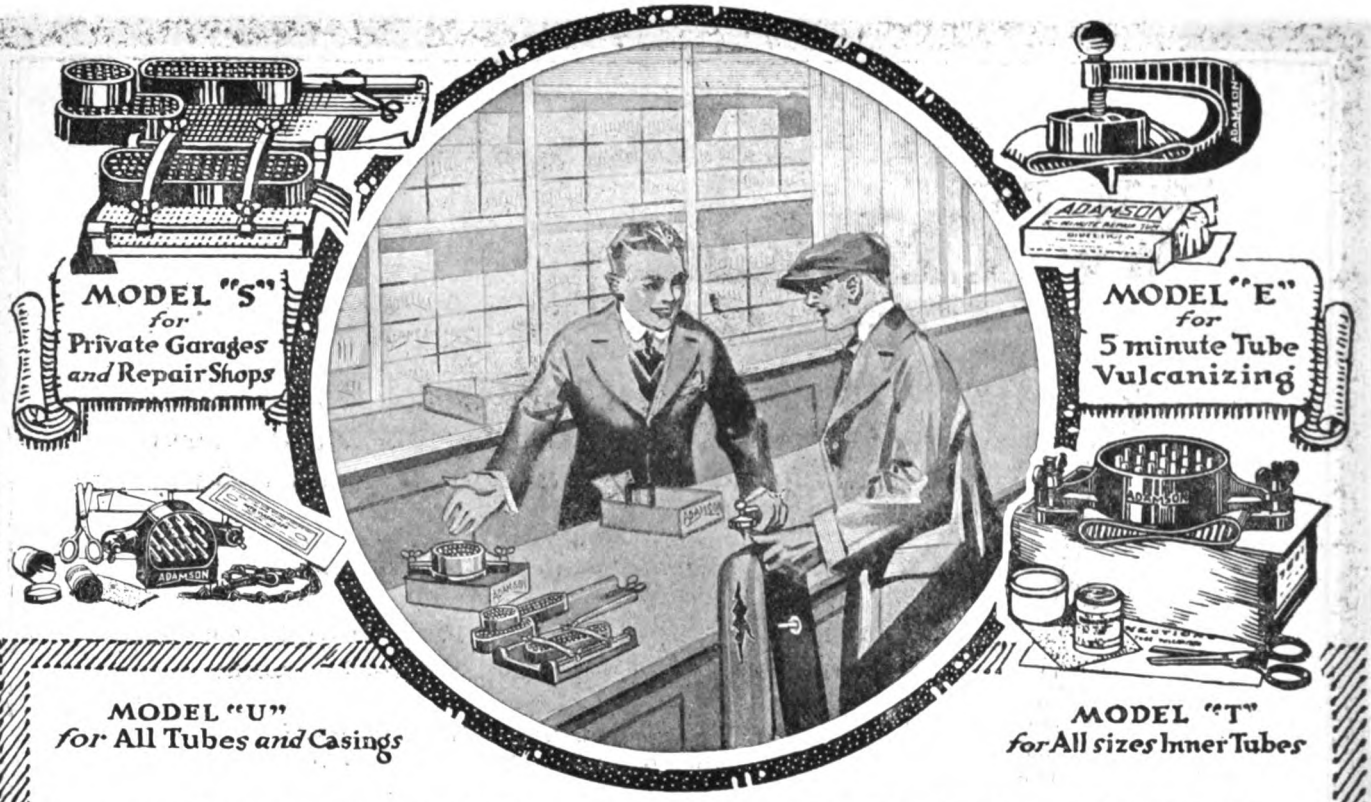
That is still another reason why you should push Harvey Springs

You will generally find that a product in which you, yourself place absolute confidence a product you feel sure of, is easy to dispose of at a profit.

And that too is a reason why you should push Harvey Springs

Satisfaction to car owners — satisfaction to dealers — that is the ideal combination.

And that is the final reason why you should push Harvey Springs



THERE'S A HARVEY JOBBER NEAR YOU — Write us and we will send you his name and address, and our latest catalog, giving complete specifications of over 900 different styles of Springs.

Write today — you may need Harvey Help tomorrow.

Totally Eliminates Carbon

COMFORT

1. THE NEEDLE VALVE CONTROL automatically reduces the consumption of gasoline in proportion to the demands on the engine and insures smooth running.

POWER

2. THE VAPORIZER is an auxiliary mixing chamber which automatically maintains the maximum efficiency of the gas at all engine speeds.

RELIABILITY

3. THE DECARBONIZER automatically supplies the engine with the moisture necessary to produce the maximum of power and to totally eliminate carbon.

THE GAS-E-CO SYSTEM for Ford cars automatically fulfills three functions, each one of which is vital to economy and smooth running.

Every movement of the gas lever at the steering wheel adjusts the Needle Valve. The Vaporizer thoroughly vaporizes the mixture and the Decarbonizer sends the proper moisture to the cylinders to ensure quick combustion and the ***Total Elimination of Carbon.***

There is always a fat spark on Gas-E-Co Equipped Ford cars because the spark plugs are always clean.

No mechanical skill is needed to install the Gas-E-Co System. Anyone can do it in 20 minutes with the tools in his kit. There are no holes to bore. There is no cutting to be done.

Price delivered by Parcel Post, $10, with full money-back guarantee. Write for interesting free booklet covering the subject of air mixture, vaporization, and decarbonization.

GASOLINE ECONOMY COMPANY

1103 Colonial Trust Building **Philadelphia, Pa.**

The Gas-E-Co System

for Ford cars increases mileage an average of 30%. It eliminates carbon. It reduces friction. It ensures a smooth-running engine. *It is automatic.*

The MUNGER "Always Tight" expansion joint

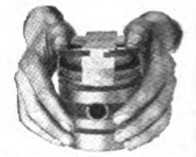
MUNGER "Always Tight" Piston Rings

Increase the power of your engine!

Give it greater speed!

Make it smoother running.

Munger "Always Tight" Piston Rings will do all this for you by making your pistons *permanently* gas-tight.



The patent method of peening these rings permits them to conform to the shape of the cylinder, and the Munger "Always Tight" Expansion Joint is a perpetual safeguard against gas wastage over, under or through them.

Anyone can install these rings without breakage. Slip them over the Munger Ring Insertion Tool and they slide into their grooves without the slightest trouble.

Each complete outfit includes one *overwidth* ring for each piston (to be used in worn grooves) and a Re-grooving Tool with which worn grooves can quickly be straightened without disconnecting the piston from the connecting rod—a saving of both time and money.

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an overwidth ring

PERFECT POWER FROM EACH PISTON

A ONE-PIECE PISTON RING

GILL PISTON RINGS are self fitting, ONE-Piece rings of sturdy construction. They have a distinctive joint which absolutely prevents the escape of compression, the formation of excessive carbon, or the pumping of oil into the combustion chamber.

ASK YOUR DEALER for GILL PISTON RINGS, or write us today.

GILL MANUFACTURING CO., 351 W. 59th St., Chicago, Ill.

DONT BUY UNTIL YOU SEE THE NEW YORK SECURITY SWITCH LOCK

FOR THE FORD CAR

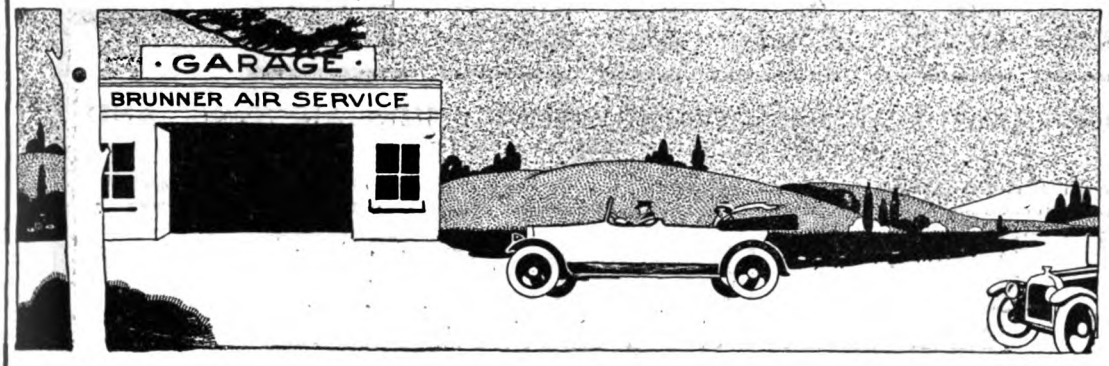
A glance will tell you that it is BETTER MADE, simpler to install, gives greater protection and sells quicker than any other Switch Lock made.

A STRONG METAL HOUSING completely covers present switch. Note that screws and screw holes are *always covered by steel bars.*

When key is removed, entire Ignition System is grounded, baffling the most expert thief as wiring "around coils" or even applying separate battery avails him nothing.

Magneto, battery current, or both may be used just the same as before Switch Lock was applied.

It fits on either old style (moulded) or new style (all metal) Switch. Your present switch is not disturbed. Wires and attaching bolts remain just as they are at present.



With these many super-features, the price is less than others—**$3.25** Complete.

DEALERS—This is the Switch Lock you will handle after receiving further particulars.

In the Garage Business, Today, Reputations Are Built on Service, and the Very Foundation of Garage Service is a Dependable Air Compressor

INVESTIGATE THE BRUNNER AIR COMPRESSOR

Garagemen who investigate the air compressor field thoroughly before placing their order invariably select the Brunner because they find a predominance of Brunner Air Compressors in the successful neighboring garages and the users always gladly recommend the Brunner, which has rendered high-class service and helped them in building up their reputation.

Years of dependable and efficient service in the garage have built up an enviable reputation for the Brunner Air Compressor, which is being maintained by the continued dependability of Brunner Compressed Air Service.

Dependable Compressed Air Tanks and Fittings Are Just as Necessary as an Efficient Air Compressor

A leaky needle valve, tank or air hose will reduce the efficiency and shorten the life of a good air compressor as well as add to the operating cost—and an improperly constructed air tank, an inaccurate air gauge or an unreliable safety valve will render a compressed air plant absolutely dangerous.

Brunner Compressed Air Tanks and Fittings Are Both Safe and Reliable and will permanently increase the Efficiency of Any Imperfect Installation

A length or two of Brunner "Resistoil" Air Hose would permanently reduce this item of expense and convince any garageman that it is by far the best air hose obtainable.

Our new No. 15 Catalogue is the most complete and comprehensive book of its kind ever published. We will be glad to send you the catalogue and the name of the Brunner Jobber who covers your territory.

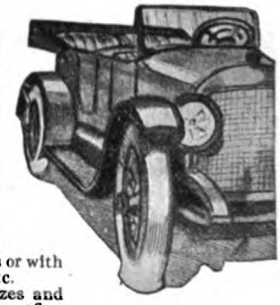
Take the Air to the Tire

THE MOST HANDY AND PRACTICAL COMBINATION AIR TANK AND PUMP OUTFIT EVER MADE



For Dealers, Private Garages and the Salesroom. For use on the instant—can be wheeled anywhere indoors or outside and takes up very little space. Equipped with automatic cutout and a No. 2 size

Portable Tank and Pump

LECTROFLATER
ELECTRIC AIR COMPRESSORS

NOTE THESE IMPORTANT FEATURES

No. 2 Lectroflater Electric Compressor; the quickest, most economical and most powerful electric compressor of its size in the world. Will compress sufficient air to inflate ten tires at a cost of one cent for current—one hundred tires for ten cents. Guaranteed to pump only cool, clean, dry air. Grease—not oil—lubricated. No oil level to maintain. Air cooled by enforced draught. No liquid to freeze or evaporate. All working parts self-contained under one housing. No exposed belting, shafts or gears.

All advanced improvements will be found in this outfit.

Will contain enough air to inflate ten tires from 40 to 80 pounds pressure without refilling. Finished in green and black enamel with nickel trimmings.

To install and operate pump merely attach electric cord connection to any electric light socket; that's all.

Furnished with husky metal wheels for hard service on cement floors or with rubber tires for use on hardwood or tile floors, sales rooms, show rooms, etc.

The Lectroflater line of air compressors includes pumps of many sizes and capacities and combination units of many different kinds, including curb outfits, portable or stationary tank and pump outfits—outfits for indoor or outdoor use, at prices that range from $65.00 up. Write today for descriptive literature, prices and complete catalogue.

A Combined Compressor and Buffer or Grinder Head

GARAGES and tire shops may affect a considerable saving by purchasing this combination instead of two machines and two motors.

Maximum efficiency will be obtained from either unit and the saving made will include conservation of valuable space as well as a saving in first cost.

The De Luxe Two-Stage Automatic Air Compressor unit needs no introduction, having given unequalled success for several years. It incorporates many definite and valuable improvements and is to be found in a majority of the better garages throughout the country.

THE buffer or grinder head will likewise withstand close scrutiny by the best experts. Motor and compressor are fully enclosed and absolutely protected against dust and dirt from buffer Compressor or buffer can be operated singly or together while automatic controls prevent overcharging of tank.

Garage and tire men should become familiar with this machine, whether in the market at present or not, by getting our descriptive circular.

We also make a complete line of two-stage and single-stage compressors.

NATIONAL BEARINGS SERVICE CO.
WRIGHT TAPER ROLLER BEARINGS
Replacements for all Standard types of Bearings
725 N. BROAD STREET PHILADELPHIA, PA.

I EARNED $2200.00 IN FOUR MONTHS

THIS IS RICHARD A. OLDHAM

Mr. Oldham was telegraph operator for the Illinois Central Railroad for twenty years. He is fifty-eight years old. During all those twenty years he drew the customary monthly salary of a telegraph operator—no more—no less. One day he read one of my advertisements and the possibilities of making money in the Auto Tire Repair Business. In a few weeks he had purchased and installed a Haywood outfit, and was doing business for himself. He was **His Own Boss.** A short time ago he wrote us that his income in four months was as much as it had been in Two and One-Half years as Telegraph Operator. You men who have been left at home—who are beyond the draft age, can and must take up the burdens left behind by others. Oldham is a living example of what can be done. I have 500 places to be filled now. 500 stations where tire repairing is neglected, because there is no one to do it.

I Must Have 500 Men to fill these places within the next 60 days

I have a big interesting book to send you—a book about tires—it explains this business—gives inside figures and profit. Gives actual proof of success—letters of others who are now operating Haywood Shops and making big money. What these men have done you can do. $2500 to $4000 a year is conservative. One machine will give you a start. You can see all business around you—everywhere there are automobiles there are tires that need repairing. You know that. All you do is open a shop—put out a Haywood sign and auto owners will come to you, welcome you and the service you bring them.

Sign the coupon and mail it today, or send a post card or letter.

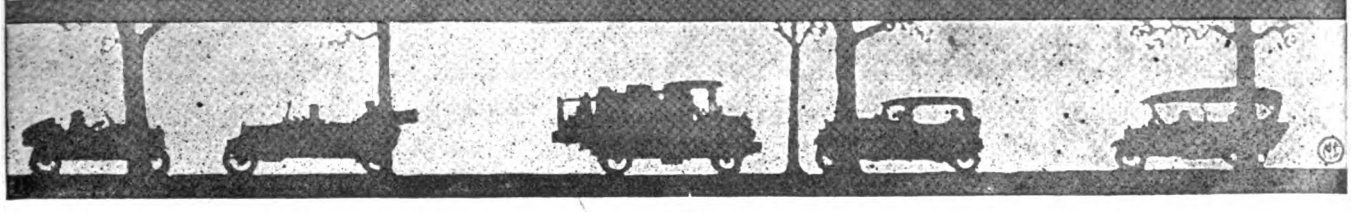
BURLINGTON MOTOR TRUCK CO., BURLINGTON, WIS., U. S. A.

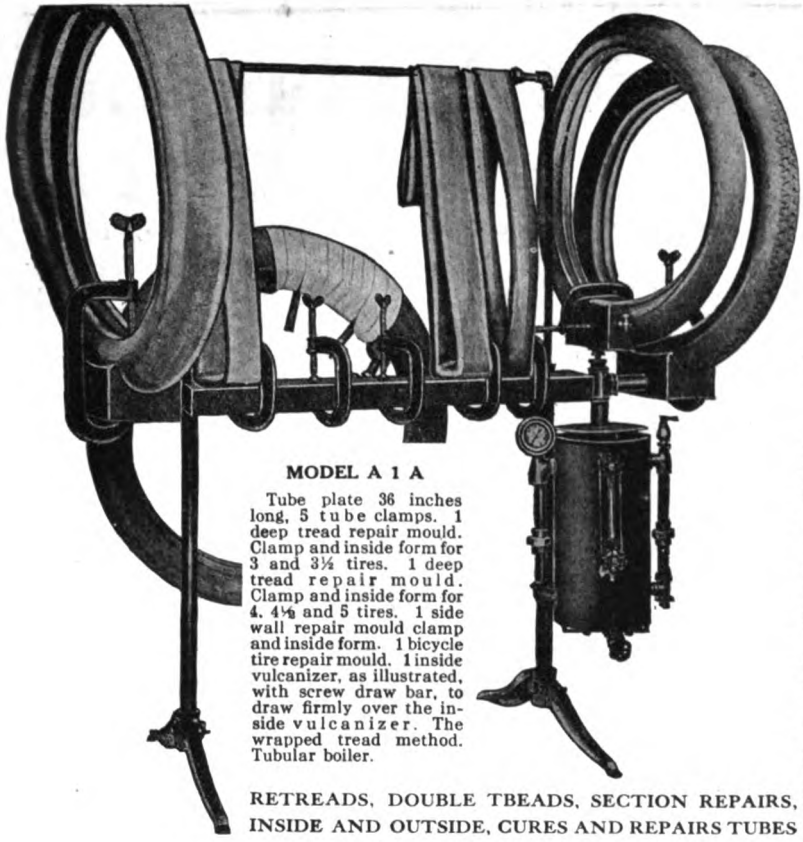
GTD

For "Every Other Car"



Here is a complete Automobile Screw Plate for Ford cars, consisting of Taps, Dies, Reamers, Stocks, Tap Wrenches fitted for the requirements of the Ford. It is called a Garage Repair Set, but is equally valuable to the dealer and car owner—in fact everyone who has occasion to care for a Ford car can use and needs this set. It is furnished in a well-made wooden box, handy for general use and to carry on the road to repair jobs.

As Ford led in standardized production of automobiles, so has G. T. D. led in the standardization of screw threads. This set consists of selected G. T. D. products to fit the Ford requirements. It is a sound investment, as proven by the large numbers sold and in use.



On sale by the best dealers—write us for particulars and booklet of Auto Tools.

STENMAN ELECTRIC VALVE GRINDER

The STENMAN ELECTRIC VALVE GRINDER bears the same relation to hand grinding that the vacuum cleaner does to the old corn broom method of carpet cleaning. Once tried it is indispensable. Ten days' usage and it has paid for itself.

Mull that over a moment—Visualize it—Don't you sense the possibilities of what this device means to you?

Our Patents Are Basic and Will be Protected.

Patented

Repair Shop Profits Are Made on Labor

YOUR REPAIR SHOP REQUIRES IT EFFICIENCY CALLS FOR IT YOUR CASH DRAWER DEMANDS IT

The STENMAN will grind a set of eight valves in 20 minutes. Whereas, it takes two hours or more to grind them by hand. And we guarantee the Stenman to do a better and more even job. Also—that a novice can operate it.

Plugs in on any lamp socket—A. or D. current. Regular stock 110, 130 volts. Made for higher voltage where required.

After the most severe tests and tryouts had been made by their engineers, these Grinders have been bought and are in use by the U. S. Army, Naval, Aviation and Postal Departments. Also, by the U. S. Steel Corp., Standard Oil, Gulf Refining, Western Electric and many up-to-date garages and shops on the East.

The universal use of the STENMAN ELECTRIC VALVE GRINDER is limited only to our ability to supply them.

An Interesting Distributing Proposition to High Class Jobbers Where We Are Not Already Represented

BULL DOG

(NEVER SLIP)

TIRE PATCH

STAYS ON FOR GOOD

It is a four-ply patch consisting of two plys of the best quality of raw red rubber, one ply of semi-cured rubber and fabric back, which adds to its strength and durability.

Makes a permanent repair for punctures and blow-outs at one-twentieth of their former cost.

SELF-VULCANIZING

Can be applied in three minutes, and no tools or heat required—BULL DOG holds forever.

ABSOLUTELY GUARANTEED

Our guarantee is the full retail price refunded if BULL DOG is not satisfactory if used according to the directions.

Insist on the genuine BULL DOG NEVER-SLIP TIRE PATCH. Accept no substitute.

Ask your dealer today; and, if he does not have BULL DOG, write us direct.

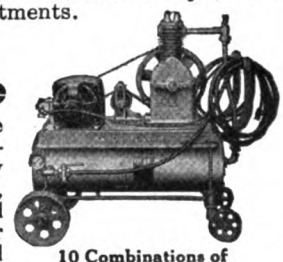
We also manufacture a high grade two-ply all rubber patch (no fabric) which we pack under the Bull Dog label.

Retails $1.00 and 50c.

Dealers, write for liberal offer.

IOWA TIRE PATCH COMPANY

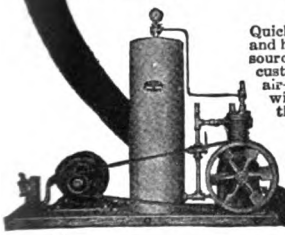
Dept. A. DES MOINES, IOWA.



CURTIS AIR FREE FROM OIL

The Curtis Compressor is the only one designed to prevent flooding the cylinder with more oil than it needs for lubrication. This, because of our controlled-splash oiling system. No excess oil is forced into the air line. **Oil ruins tires**—air free from oil means fewer blowouts and increased mileage all around for your customers, with less tire adjustments to you. Make your place the most popular one in town. An easy and inexpensive way, is to install a Curtis Compressor. The customer assumes if you have the best free air service, you will have the best service in all departments.

Costs No More Than Ordinary Compressors—But Note The Difference



Live garages and service stations are using Curtis Air Compressors. Motorists expect free air service. Why not give them the best and win over new customers by supplying, not only reliable air service, but **Curtis Air—Free From Oil.** A poor air system which shoots oil into the tires, or which is unreliable, drives customers away. Thousands of Curtis Outfits are rendering daily, effective, efficient service all over the country. Your Curtis Compressor can further pay for itself by supplying air for air hoists, painting, cleaning, vulcanizing, blowing dust and drillings from tools, and many other things. Curtis Compressors are backed by manufacturers who have been specialists in this line for twenty-five years.

10 Combinations of Compressor and Tank Sizes—Any Current

Five Sizes—Tight Pulley Only, or Tight and Loose Pulley

11 Combinations of Compressor and Tank Sizes—Any Current

Makes New Customers—Holds Old Ones

Quickly pays for itself in bringing in new trade and holding the old trade, for it not only is the source of a dependable supply of air when your customers want it, but it also supplies clean, cool air—free from oil. Motorists realize that oil will quickly destroy their inner tubes, and, therefore, look for a station that supplies Curtis Air—Free From Oil.

Curtis Compressors are built to meet the requirements of your business in sizes, arrangements and prices. Send coupon at once for full information and attractive prices. It will pay you to investigate our proposition. *Write us today, or ask your jobber for prices—but insist on a Curtis.*

CONNECTICUT

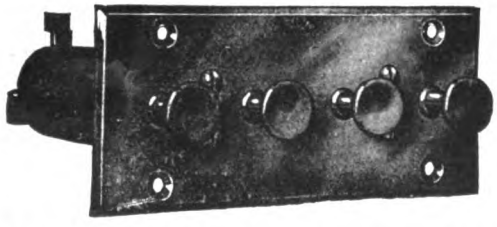
Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.



One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS
The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.

HEAD, SIDE AND TAIL LIGHTS
Head and tail lamps on and off together. Side and tail lamps on and off together.

DASH LAMP
Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

"NORMA"

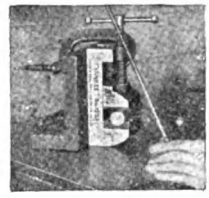
PRECISION BALL BEARINGS

(PATENTED)

Unless your factor of safety is amply large throughout your machine—even in the so-called minor parts—your whole construction is weakened. Your ability to meet overload and emergency strains is limited by the resistance of the weakest part. The reserve strength of a car or truck is only that of its weakest part or accessory.

The proved service capacity of "NORMA" Speed Bearings—the high factor of bearing safety which they impart to an accessory in which they are used—explains why the makers of magnetos and lighting generators of proved dependability have standardized their product on "NORMA" Bearings.

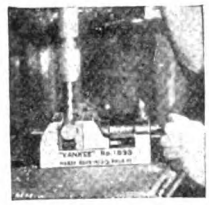
Be Sure—See that Your Electrical Accessories are "NORMA" Equipped

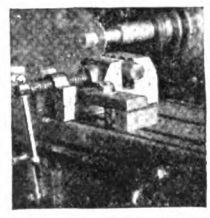


THE NORMA COMPANY OF AMERICA

1790 BROADWAY NEW YORK

Ball, Roller, Thrust and Combination Bearings.





No 1—"YANKEE" Vise, set on service plate and holding steel cylinder for accurate center-marking.

No. 2—The centers, on the cylinder as above marked, being punched for drilling.

No. 3—"YANKEE" Vise, with work, removed from bench to drill press. Holes are drilled absolutely true.

No. 4—"YANKEE" Vise, still holding the work in original alignment, fastened to bed of milling machine.

Removable from Base For Continuous Work

You do not remove the work from the "YANKEE" Vise, but move the vise itself—for the various operations, on bench, drill-press or other machine.

So, you see, the "YANKEE" Vise is needed in every shop or garage, no matter how many other vises are there; wanted by every motor mechanic—because it works in ways and places impossible for other vises: Multiplying Man's Power!

The "YANKEE" Vise is machined square, for use on end or either side as well as upright. Provided with V-grooved steel block for holding round and irregular shapes.

As a time- and labor-saver—and better garage-service to patrons—this vise is in a class with the "YANKEE" Ratchet Breast and Hand Drills and "YANKEE" Automatic-feed Bench and Chain Drills.

"YANKEE" Vise

No. 1993, with Swivel Base

Price, $6.50

Body 7¼x2¾ (wide) by 3 inches. Hardened steel faced jaws; open 3⅛ inches. Vise held to base by set-screw. Camthrow lever locks position.

No. 993—"YANKEE" Vise without base—Price, $4.50

Evr-Lastin TRADE MARK
GEAR COMPOUND
Less Required—Lasts Longer

It is only necessary to use one third the quantity of ***Evr-Lastin*** that you would oil or grease—and will last three or four times as long. Comes in 5, 10, 25 and 50-lb. tins—also in 225 and 400-lb. barrels.

FREE TO DEALERS With first order for half or full barrel of *Evr-Lastin*, we will send a self measuring 20-lb. grease cabinet free—pumps ¼-lb. to the stroke.

You will find ***Evr-Lastin*** a big money maker—write us today for prices and full particulars.

IMPERIAL OIL CO.
3140 Locust St. St. Louis, Mo.

Digitized by Google

Signs of Wear

FRICTION pock marks are at first too tiny for the naked eye to see. Imperfect lubrication has permitted metal to metal contact. Roughened gear surfaces cause increased friction, gears get noisy and their destruction is rapid.

Put a stop to wear by using

TRADE MARK REGISTERED IN

NON-FLUID OIL

UNITED STATES PATENT OFFICE

It cushions gear teeth, preventing metal to metal contact and gives perfect lubrication all the time—never hardens with non-use or cold nor melts with heat. Use it on every gear and bearing in your car.

Get "KOO special" grade for gears; "KOOO" for bearings.

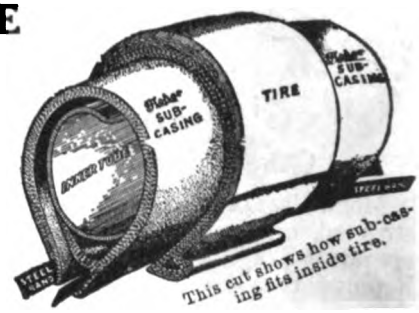
THE Fisher PATENTED RIM-GRIP SUB-CASING



MORE MILES PER TIRE LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.

A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

PECK'S SUPER HEAT MANIFOLDS

Are Doing Their Bit

Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

West of Rocky Mountains, $8.50

If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.

With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.

If Your Dealer Can Not Furnish You, Write to Us Direct.

Very Handy for All Sorts of Milling Jobs.

Send for New Literature and Prices.

Barnes Drill Co., Inc. 1907 818 Chestnut St., Rockford, Ill., U. S. A.

Builders of the All-Geared Drill and Gap Lathes.

Guaranteed for 10,000 Miles

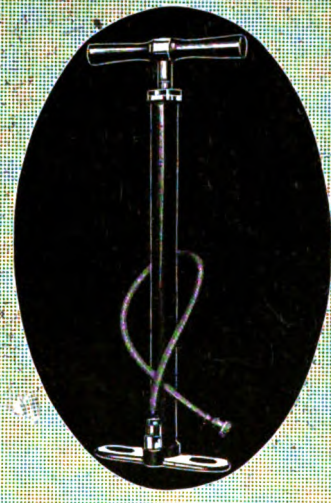
EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding and economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.



FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

ASBESTOS BRAKE LINING

Meets every emergency—is everlastingly durable. Will not burn, glaze or crumble.

When automobiles were simply considered pleasure cars, any old brake lining might do—provided the car owner was willing to risk his life and his car.

But now, when every car should be on the road every day to relieve congested transportation facilities—the use of dependable **S-M-C** becomes a patriotic duty.

See the S-M-C on every roll of brake lining—its use means **Safety Made Certain.**

Made in rolls of all widths up to 6 inches.

DEALER'S COUPON

VOL. XXV. No. 3. NEW YORK, MAY, 1918. PRICE {10c. PER COPY / $1.00 PER YEAR

CARELESSNESS

In one of our large Eastern cities not long ago, a man jumped from the tenth story of an office building to the street. The sensational papers played rather strongly on the accident, which was witnessed by many thousands of people, and claimed it to be one of suicide. In all, perhaps there were 75,000 or 100,000 people who read the account of the accident and had a certain feeling of horror at this method of ending one's life.

Over 6,000 people in the United States commit suicide in just as direct a way as did this man. Six thousand four hundred and twenty-two people last year were killed by automobiles, the deaths in every case being directly traced to carelessness.

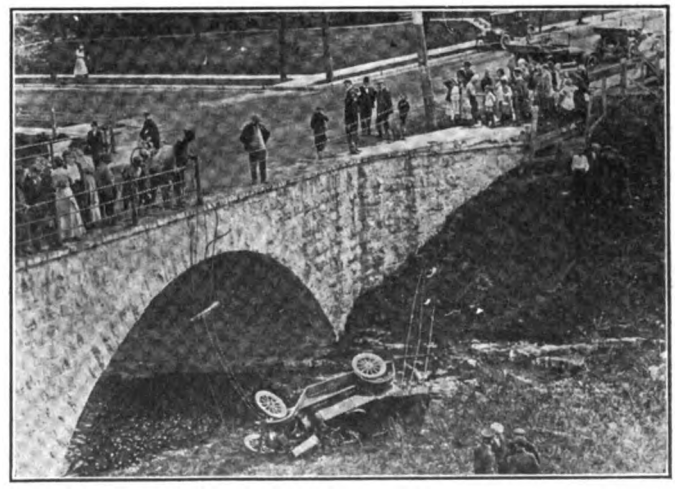
These are the figures that have been used by the Universal Film Manufacturing Company of New York in their film entitled "Careless America," which has been produced by the kindness of Mr. H. S. Firestone in his campaign against needless loss of property and life through carelessness. I speak of the number of deaths as being over 6,000. Approximately three times that number of people were injured and when one stops to think of it, this needless loss of life and maiming of people should be condemned by every person in the United States.

Hurry Everywhere.

An eminent French politician was once asked what his impression was of America, and he said that the one English word which came to his mind, best describing his impression, was the word "hurry." Everywhere he went, he said, he had that feeling of a person being out of breath. Everybody that he saw seemed to have their minds intent upon getting somewhere and getting there as quickly as possible, without respect to the feelings of their fellow men.

The old slogan of "Time is Money" is carried out in this country very literally, so literally, in fact, that thousands of people daily jeopardize their lives and their health simply to save a few seconds.

On the island of Long Island alone, last year, 109 automobilists speeded directly in front of railroad trains, despite all warning. Mr. Ralph Peters, the President of the Long Island Railroad, states that no less than 109 gates, which had been lowered because of approaching trains, were broken off last year by automobile drivers on Long Island. Which is the better word to describe such happenings as these? Shall we term them "accidents," or shall we term them "criminal negligence?"



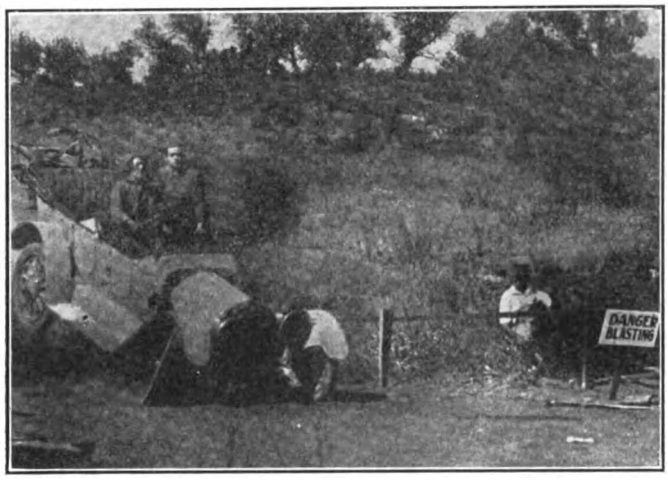
Not long ago I chanced to be near a place where an accident of this sort had happened. For over half a mile in each direction the track was in open view of the crossing. There were, perhaps, five machines a minute passing over the tracks at the point in question. At the time of the accident, five automobiles were drawn up at each side of the track waiting for the passing of a fast express train which could be seen in the distance.

A Bad Accident.

A small car driven at an excessive rate of speed passed the standing machines and ran directly on to the track in front of the approaching train. The driver of this car paid for his carelessness with his life, for the machine was hit squarely in the center and carried a distance of over 200 feet. Nothing was left in an unbroken condition except one front wheel. The rest of the machine had been reduced to a mass of bent iron and broken wood. Even the upholstery had been torn into shreds under the train wheels.

Strange as it may seem, one person survived with but a few minor injuries. Three others were killed. From the survivor it was learned that the driver knew the train was approaching and despite the warnings of the other passengers, he had tried to save a minute by cutting across the track. The party was out simply for the ride and had no reason for saving time; 369 deaths were caused in the United States last year through just this sort of carelessness.

The speed maniac is just as much of a menace to this country as tuberculosis. Upon his head rests the blood of many innocent people. Not only does he put his own life in danger at all times, but he



He Didn't Know the Road But That Didn't Prevent the Accident.

Digitized by Google

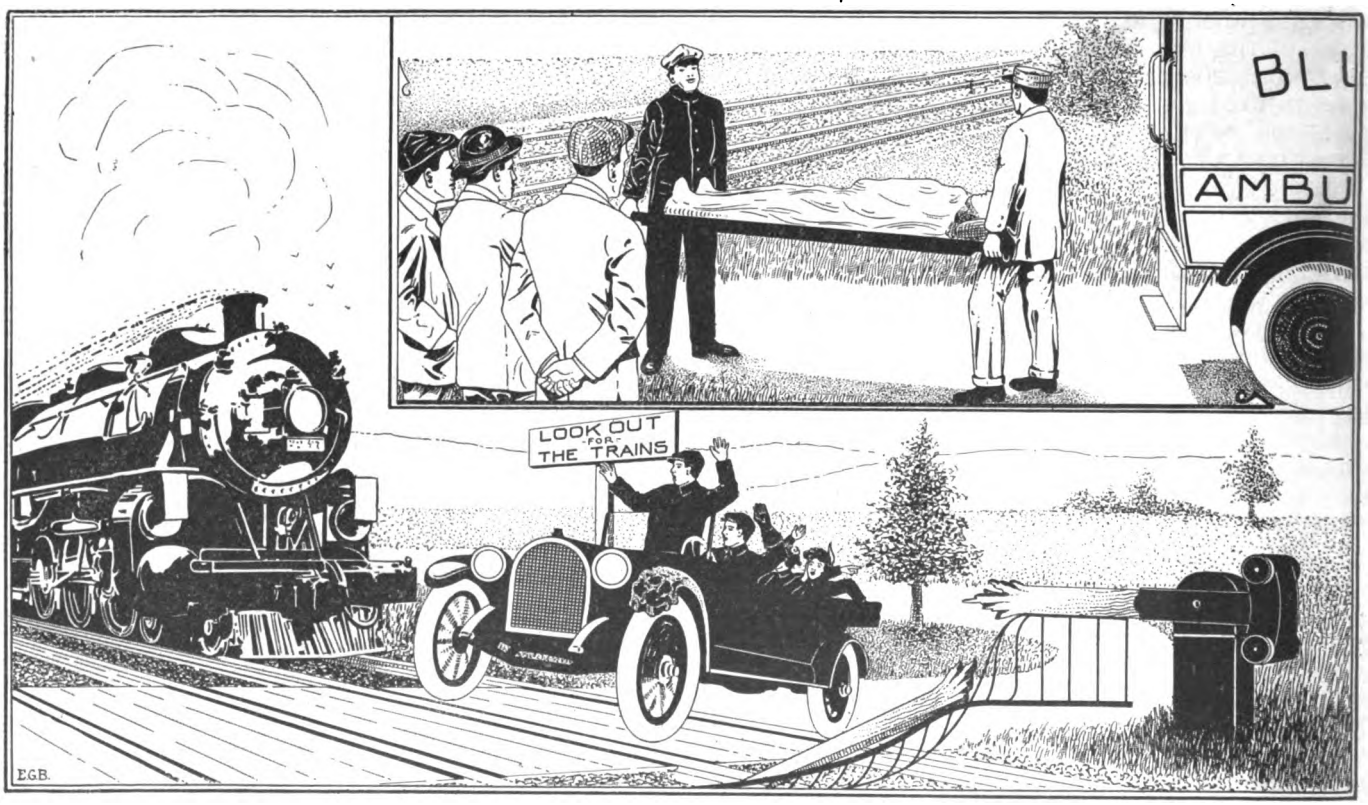
is a menace to the community, and the existing laws cannot be made too severe for his punishment.

Two thousand people last year were killed directly through the results of accidents caused by overspeeding. The phrase "lost control of his car" is getting to be a common one. Practically all of the State laws are worded in such a way that, to lose control of the car, is a crime.

If You Drive an Automobile You Should Believe in Signs, Particularly That of "Road Closed."

Excessive Speed.

What does the phrase mean? In 99 cases out of 100 it means that the car is driven at too high a rate of speed. It does not mean that the steering mechanism is at fault or that the car is to blame; it means that the driver has lost his head through his own carelessness. "He did not know there was a curve in the road" or "he did not know there was an embankment ahead" has been said many times in the case of bad accidents. Granting that he did not know such a peril existed, was there any excuse for the accident? I answer emphatically "NO." If he had been travelling at a normal rate of speed, he would have been able to have stopped the car before going over the embankment, or running off the road at the curve. "Excessive speed" is the answer in practically every case of this sort.



In the old days of horse-drawn vehicles, an accident of this sort was almost unheard of, unless the horse ran away, or the driver was intoxicated.

Only 103 deaths were caused in 1917 by defective brakes or steering gear, and I dare say that out of the 103 cases, 75 per cent. would not have occurred had the driver taken care of his automobile. A good driver not only keeps his automobile in condition, but never travels at such a rate of speed that his car is out of control, even should the brakes cease to hold or the steering gear become inoperative.

How many drivers are prone to ignore the sign "Road Closed for Repairs"? I will venture to say that a large percentage of the drivers smile at such a sign and pass it without a thought. The careless driver not only passes such a sign, but frequently does more than this. If the road has been fenced off, he is very apt to remove the fence in order to pass, and sooner or later he is bound to meet his fate. He may drive over an embankment, or he may get caught in a blast. At any rate, he is inexcusable.

He Didn't Know It Was Loaded.

This sort of a driver is in the same class with the man who drives in front of an oncoming locomotive, and has no one to blame but himself for his injuries. As in the former case, he often pays the price with his life. Such accidents as these are criminal and inexcusable and the driver figuratively jumps from the tenth story of a building. He is in the same class with the man who looked in the

On Long Island Alone, 109 Railroad Gates Were Broken by Careless Drivers.

Digitized by Google

uzzle of a gun and did not know that it was loaded nd probably never will know that it was loaded.

There is another class of accidents which might e eliminated from the records, if it were not for ie pedestrian. To a certain extent the roads are ree, both to vehicles and to pedestrians, and there re a certain number of the latter who feel that they ave more right to the roads than the automobilist. wonder how many of these pedestrians would coun-

e Was in Such a Hurry That He Didn't Wait for the Draw Bridge to Close.

enance the driving of an automobile on a sidewalk? 'hey would probably be the first ones to raise a omplaint, while these same people cross the street rith no thought of vehicular traffic. Seven hundred nd four of these "jay walkers" were killed last year. 'erhaps many of them suffered because of the fact hat the automobile operators did not have their iachines under control. At the same time, however, ould not the accidents have been prevented by the edestrians, by exercising a little more care?

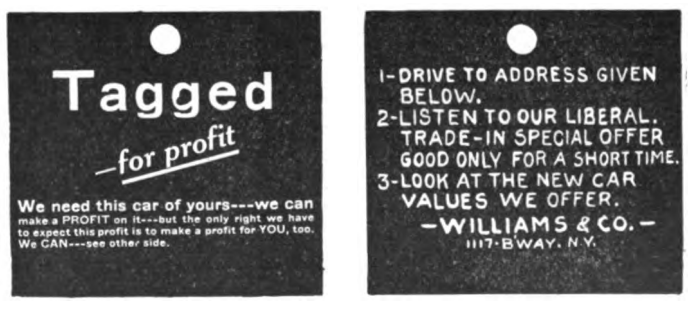
Not long ago I watched a man thread his way cross a congested street, while he was reading a ewspaper. He did not get hit; not that time, but if knew his name I feel confident that I would sooner r later find it in the death column of the newspaper.

Not all of the 704 deaths were the result of the edestrians reading newspapers, but they might all ave been avoided had the pedestrian exercised due recaution. Many accidents of this sort are caused y the desire to save time. Perhaps the pedestrian ins across the street in order to board a trolley ar. He wants to save a minute, and usually ends by sing considerably more than the minute.

Parents Are Often to Blame.

It is very strange that parents, who are themselves areful, do not instill this "safety first" idea in their ildren. Granting that "boys will be boys," a cer-in amount of training will instill in the boy's mind sense of personal safety. One hundred and twenty-x boys were killed because they stole rides on au-omobiles, trucks or trolley cars last year. We can-ot blame the boys for their deaths, but we can ame the parents, for it was their fault primarily. Two hundred and thirty-five children were killed while playing on the streets. The blame in this case also rests on the parents. The child is more or less of an imitator and, to a certain extent, he is very apt to court the danger element. If he sees his father cross the street in front of an automobile, he is very apt to discount the attendant danger, without realizing that his parent has a sense of proportion which he lacks. Without thinking of it, the father has computed distances in his mind, together with the speed of the approaching machine, and realizes that he can get across without endangering his life. Whereas the boy is probably too young to work out such a problem for himself, and at some time or other in imitating his father, the automobile may be just enough nearer so that he is unable to escape.

A motion picture has been evolved and produced by the Universal Film Manufacturing Company, the purpose of which is to eliminate many of the accidents caused by carelessness and will be shown throughout the United States during the coming year. It is entitled "Careless America" and is being distributed to moving picture houses without cost, due to the benevolence of Mr. H. S. Firestone. Three of the pictures used in illustrating this article are had by the kindness of the Universal Film Manufacturing Company.



This motion picture will enable one to realize how much of the intense suffering could be avoided, how many hundreds of innocent people saved, if only the thought of "safety first" were not forgotten. All of our readers are urged to see this picture and to do their share towards the making of a more "Careful America."

A "TRADE-IN" CAMPAIGN THAT SOLD MANY NEW CARS.

BY CHILTON GANO.

An ingenious idea for a "trade-in" campaign, which could be used by any automobile dealer, was tried out recently on a big scale by an automobile manufacturer. The dealers of this manufacturer, in over sixty selected territories, followed the manufacturer's instructions, and the direct result was the sale, in the sixty odd territories, of over 1,000 new cars, or an average of about fifteen sales for each of the dealers. The campaign was not national in any sense, but was merely a single local campaign multiplied by sixty.

Of course, the sale, which does not involve the trading in of an old car, is the most desirable kind, but when the fact is admitted that probably over 65 per cent of all sales of new cars involve an allowance

The Face and Back of the Tag Put On Used Cars.

on an old car, why should a dealer not face the fact and make the best of it? That was the line of reasoning that led to the adoption of the plan in ques-

Digitized by Google

tion. It was designed to go direct after "trade-in" customers, and to do it in such a way that the cars offered in trade would be the most desirable second-hand cars as opposed to comparatively worthless ones.

Tagging Cars.

Tagging of cars along the curbs was the first step in the campaign. The tag shown herewith, about the size of a postcard, and a bright orange in color, was provided to dealers by the manufacturer. The dealers' salesmen went along the streets and tied the tags to the steering wheels of the especially desirable used cars. Only three or four cars were tagged in even the most congested blocks. The tags thus complimented as well as interested the car owners, who were quick to observe that cars on either side of them had not been tagged.

The tag alone was merely the introduction to the campaign, which began immediately after the tagging in newspapers and by means of letters. A series of six special newspaper advertisements were used in each territory, 125 lines by four columns in size. "Blank Trade-In Sale Begins Tomorrow," announced the first. "The chance of a lifetime to trade in your old car!" Etc.

Simultaneously, a series of letters to car-owner prospects were sent out on the dealers' letterheads. Four different series of letters were provided by the manufacturer, the first for owners of tagged cars, the second for owners of small cars, the third for general prospects, and the fourth for owners of Blank cars.

The tagged-car feature was the strongest, and the follow-up to owners of tagged cars is of special interest in that it made a no-cash-down offer. This letter began: "Dear Mr. Jones: We tagged your car because we want it. We want to buy a few used cars like yours, in good condition; and right now, while we have a demand for these used cars, we are willing to make you a good proposition on your car in exchange for a new one, if you will come in and see us during our trade-in sale."

Among the copy arguments used were, that new cars are due to advance in price right along, that a lively demand for good used cars made liberal allowances possible, that there might be a shortage of supply by spring, and that the new Blank models were superior in every way.

Dealers were also provided with special four-page illustrated letters to prospects on which their own letterheads could be imprinted. These illustrated the new Blank models and were such as almost any dealer can secure from his manufacturer on request.

Original ideas nearly always pay in advertising, because they catch the consumer's interest. This tagging idea paid in every territory in which it was tried, both in bringing about trade-in sales and also attracting purchasers who wanted to buy used cars. The campaign emphasized to such purchasers that the dealer so advertising had exceptionally good values in used cars to offer.

The company's branch manager in Kansas City, for example, reported sales in his territory as 266 per cent. better than he had figured in advance would result, and used car sales as having increased 25 per cent. during the two weeks of the sale.

A Visit To A Busy Louisiana Repair Shop

A Few Helpful and Interesting Points Gained From Original Methods Used By An Up-To-Date Southern Garageman

BY JAMES F. HOBART, M. E.

"Getting the car ready so that you can take a ride in it?" the writer recently asked of a mechanic who was finishing the repair work on a good looking "———— eight" chassis.

"Well, I should hope not," replied the mechanic, as he tried another piston ring into one of the cylinders. "I sure don't ever want to ride in this car after it leaves this shop! You see, I'm fitting up this chassis for an ambulance, and that's the reason why I don't want a ride in it after the car is finished."

"It would be strange, wouldn't it," the mechanic continued, "if I should really be the first man to ride in the new ambulance? Well, I hope I don't though!" Some different, this, from Mr. Patrick Duffen, who used to be an "old rounder" ten years ago at South Bend, Ind. One day the city put out a brand new auto patrol wagon which whizzed past Pat, who then and there went to the nearest saloon and got "roaring" drunk in order that he might have the very first ride in the new "hurry-up" wagon. And he got it, too!

Front Window Overhauling.

The car noted above, which was being changed over into an ambulance, was made to do a bit of very effective advertising. Instead of having the work done, as is usual, in an obscure corner of the back shop, where it is usually dark at all times, the overhauling was done right in the big front window with two or three high grade cars standing around.

The room had a fine wood floor of hardwood, well polished and cared for. Shallow pans were placed underneath each show-car, and in this way the floor was always kept clean and free from even a sign of a grease puddle. A section of wide linoleum had been spread out at the front of the show window, the chassis placed upon the linoleum, and then blocked up with the wheels removed. The blocks were high ones, about two feet, so that easy access could be had underneath the car and at the same time the high blocking made it much easier to work at the engine, the high blocking making much tiresome stooping unnecessary.

A Fine Display.

All the large parts, after removal from their places, were cleaned and then spread out on the oilcloth under the car frame, where the parts made a very attractive display; many people stopped outside to look matters over, and many came inside to give closer attention to the work which was being done.

Digitized by Google

The young man who was doing the work took especial pains to be very attentive and agreeable to people who came inside, and he even went out of his way a bit to give information to people who were interested but who seemed to feel that the young man would not like to have his time taken up answering questions.

The owner of the garage told the young mechanic to spend all the time necessary in answering questions and to giving all the information possible, and even to be patient with the "fool questions" which are so often "fired" at the garage man.

The parts of the mechanism, being laid in orderly arrangement on the oil-cloth under the machine, formed a setting to the work of the mechanic which can hardly be realized by anyone until they have tried the same thing and estimated the great value of the attraction, in an advertising way, which is invariably given to any window display of an operative character.

Probably the parts of the dismantled car might have remained spread out in the show window for weeks and months without attracting more than mere passing attention from a few people. On the other hand, the mechanic might have overhauled the car right there in that window without attracting even passing attention, had there been a lot of dirty pieces of mechanism scattered around in any old fashion, with dirty wipe-rags here and there, and perhaps with the mechanic wearing overalls which would have shamed a chimney sweep.

Everything Clean and In Order.

But everything was kept clean, there was not a particle of loose dirt or grease to be seen anywhere. The parts of the mechanism had all been cleaned before they were placed beneath the car frame, and the mechanic wore overalls which were clean all but for the "working dirt," which soiled them in places. That is, the overalls and jacket were not worn until grease and dirt would actually drop from them when they were shaken.

Fitting Piston Rings.

As the writer stepped into the garage, to have a closer look at the display above mentioned, the mechanic was fitting a new set of piston rings and had the set hanging upon a hook as shown at E, Fig. 2, one end of the hook, D, being slipped into a convenient hole in the top of the frame, C.

The axle, A, had been blocked up, as stated above, the large square block, B, preventing any possible

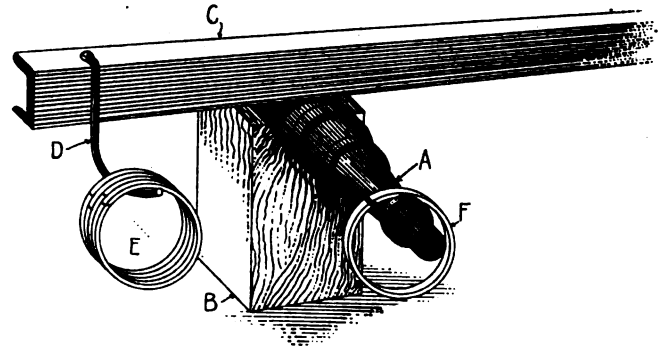


Fig. 2.—How the Piston Rings Were Kept Conveniently Handy While the Work Was Being Done.

tipping over of the frame no matter what work might be in process. The mechanic had a box upon which he sat while at work filing the rings so they would go inside of the cylinders.

He did the work of filing while seated upon the box, in comfort, the ring which was to be fitted being placed upon axle, A, as shown at F. The cut in the ring, being spread apart a bit by the fingers of the left hand, a thin, flat file was placed between the ends of the ring and one end worked off, care being taken to prevent all "rocking" of the file and to keep it square and true against the bevel of the ring at all times.

The rings, being "oversize," like all new rings, had to be filed in the bevel or cut, until the ring would lie inside of a cylinder without showing any gap between the ends and without the least side-lapping of the ends of the ring. The tests for these things were made with one of the thin steel tools, sold at any hardware store or tool supply house, the tool consisting of a bunch of thin, hardened pieces of steel of varying thicknesses attached to a handle something like a bunch of knife blades, but so fixed that any one of the thin steel pieces might be "opened" from the handle.

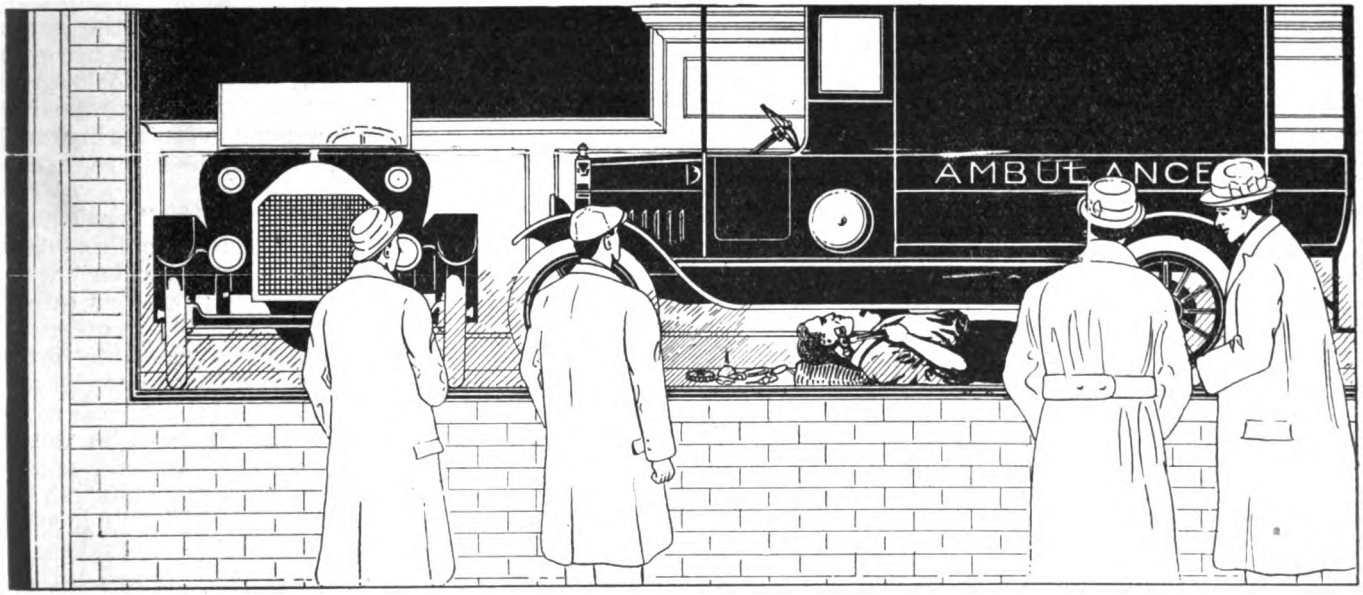

Fig. 1.—A Machine Was Repaired in the Front Window of the Garage and Proved a Unique Idea; Interested Spectators Were Always in Evidence and They Often Went Inside.

Digitized by Google

With one of the very thinnest pieces, the mechanic would "explore" the cut between the ends of a ring after he had filed them a bit. For the test, the ring would be slipped squarely into the cylinder in which it was intended to be ultimately placed, squared with the face or end of the cylinder and then one of the thin test strips thrust between the ends of the ring

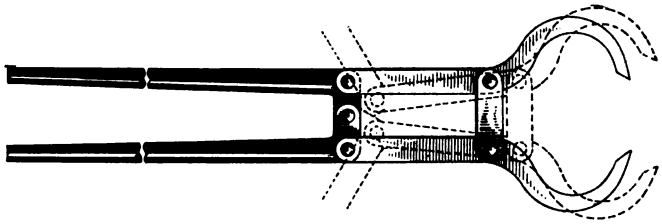

Fig. 3.—A Handy Quick Acting Spring Leaf Spreader Designed By the Garageman.

to determine if they were actually in contact, whether they fitted entirely along the filed ends, or whether the ring was offset sidewise.

The steel strip was also used along the side of the piston ring to determine whether or not there was a side offset. The steel strip, acting as a straight edge, would show with great exactness the least offset of the ends of the ring, upon finding which a little more filing would be done to the ends of the ring, which was returned to the "filing station" upon the axle as shown by Fig. 2 for the purpose of a little more reduction in length.

Using Chains in Louisiana.

It might seem queer that there should be a demand for chains in Louisiana, where it snows only "once in a dog's age," still there is a great demand there for chains, on account of the exceedingly slippery condition of some of the streets at certain times. Frequently a fog rolls in from the Gulf of Mexico—or somewhere else—which seems to cover everything which it touches with a slippery slime.

When the big "ballast" paving blocks, so much in use in some of the Gulf cities, become well coated with this slippery fog, automobile wheels will spin around like teetotums, and chains are in demand at once. If regular chains are not at hand, some car drivers will raid the nearest hardware store and bring out all kinds of chains, even to "log" chains with links made of steel half an inch in diameter.

A Log Chain on One Wheel Only.

Sometimes, the writer notices, a driver is not at all careful about putting on a pair of chains, but will slip one around one power wheel, then go ahead, letting the one chain grip the road as best it may, while the other wheel slips and slides around a good deal.

In Memphis, Tenn., during the ten inches of snow which came with the blizzard just after Thanksgiving day, many automobiles were seen running with a single log chain wound around the rim and tire of one wheel, no chain at all being placed on the opposite wheel.

Before doing a thing of this kind, which should be tolerated only in case of dire necessity, the car driver should study the action and behavior of a car in deep snow, with a heavy chain on one power wheel only. In a case of this kind there always must be a considerable amount of slipping of the wheel which has no chain, therefore, the differential must have a good deal of hard work thrown upon it, work which will wear it out in a very short time, faster than legitimate wear could do if there were a chain on each power wheel.

Parked Car Repairs.

For some time the writer has been watching with a good deal of interest a certain young man who operates a garage and repair shop:—"For Anything and Everything, but for Automobiles Mostly." Having recently opened the repair shop, business was not built up to suit him, and he cast about for ways and means whereby he might increase the number of his customers.

Near his garage was a church and a small park, around both of which business men were in the habit of parking their cars during office hours. When business was slack in the shop, the young man would visit the cars which had been parked, look them over carefully, and make note of anything that he found which needed repair or attention.

He would take occasion to be "Johnny on the spot" when the owners of said cars arrived in the morning or departed at night, and then and there the young garage owner would present his card and tell the car owner about the things he had noted; offering to make the necessary repairs, whenever possible, to the car while it was parked or if actually necessary to take the car to the shop and return same in time for the owner to go home with it at night.

The amount of business which the young man worked up in this manner was quite large, far more than he expected, and he now keeps two mechanics, who spend nearly all their time around town among the parked cars looking for business, and getting business, too!

After a while the business developed to the point where some means had to be found for ascertaining quickly the ownership of a car which was found to need attention, and the garage man sent out his men to take the license number of each and every car found parked within a radius of his shop in which he expected to operate.

Then, with hundreds of license numbers, means were taken to determine the names and addresses of the owners of said cars, after which the business became very easy. Whenever a car was found, the springs of which required oil, the top fixed up a bit, tires changed or fitted with new treads, the garage man, upon receiving from his man the license number and requirements of any car, would look up the owner and over the 'phone would make a proposition which usually met with a very encouraging reply and led to business in the immediate future, even if not at once.

A good deal of the "Parking Work" secured by this garage man is the oiling of automobile springs. For this work he has provided a "spreader" which may quickly be applied to a spring, and as quickly operated and removed after the oiling operation. Some "spreaders" are made to be operated by means of a screw, which forces knife edges or wedges between the spring leaves, but this kind of a tool proved not rapid enough for our man, who worked up one, as shown in Fig. 3, which applied the spreading pressure by means of a lever, somewhat similar to the action of a pair of tongs or a double-leverage bolt cutter same as is used by carriage makers for snipping off the ends of tire bolts and small carriage bolts.

Digitized by Google

The oil-grease was used and was contained in a small "grease gun," by means of which a very thin "wire" of grease could be squeezed through the long, slender spout of the "gun" and deposited right in the middle of a spring leaf.

After applying the "spreader" and before the grease was squeezed out, the garage man would clean the spring leaves as well as possible with a small brush which he carried for that purpose, then the grease was placed directly upon cleaned surfaces.

A Traveling Service Truck.

It was soon found expedient to add a service truck to the business and to rig up a compressed air outfit which was permanently located in the truck. This outfit consisted of a small belt driven, air-cooled, air compressor, to which was belted a small gasoline engine.

The garage man has promised himself that "some day" he will place both engine and compressor on the same base and arrange them direct connected so as to do away with the nuisance of the belt drive between engine and compressor.

Some one does actually build direct connected outfits of this character, for the writer has seen at least one such machine at work. Believe it was in a garage in Newark, N. J., some time in the early part of 1917, but the writer was unable to ascertain who manufactured such machines, as even the owner and user of the machine in question did not know its pedigree or where it came from originally. Said he, "Done just bought it with a lot of other junk and stuff."

The garage man who started the "Parking" business above noted submits that he is seriously considering the making up of a large service vehicle, taking a good used "Jitney" for that purpose, in which there will be room for a pretty complete automobile repair outfit, and inside of which a whole lot of work could be done during inclement weather, when open air "parking repairs" are at a decided discount.

Setting Cotter Pins and Tightening Nuts.

Quite a bit of the revenue derived from "parking work" comes from giving a car a general overhauling as regards nuts and cotter pins and the filling of hubs and other receptacles with grease. It is claimed that vaseline makes a mighty good grease for the ball bearings in wheel hubs, and the frequent removal of the wheels from the front axle, the cleaning out of the ball bearings and the introduction of new vaseline adds to the profit of the parking garage worker and to the life of the car.

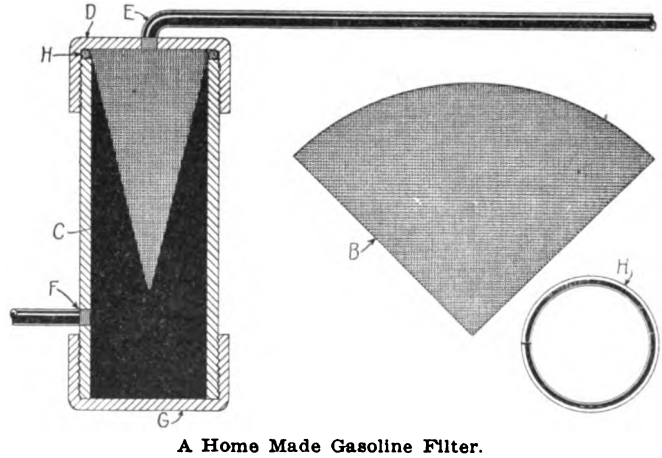
When tightening the nuts of a car, this mechanic says he always makes it a point to observe the direction of a hole before starting to tighten its nut, then he can always bring the castle nut right for the pin without having to stop and hunt for the pin hole!

"I always like," he continued, "to tighten all the nuts, then to go over the car again to set the cotter pins, for then I am sure that none have been missed, something one never can be sure of when a nut is tightened here and a pin inserted there, with no definite system of doing the work. When I first tighten all the nuts, then go around again and insert the pins, I know that none will be likely to be overlooked, for I have nothing but the cotter pins to think of and I get them all."

DIRT IN GASOLINE.

In Preventing Dirt From Reaching the Carburetor the Motorist Is Often Saved Both Time and Patience.

The automobilist, who has owned a car any length of time, realizes that there are a great number of small annoyances constantly cropping out which tend to reduce the pleasures of motoring. Not the least among these is the trouble caused by dirt or water in the fuel. Impurities in gasoline are seldom blamable to the gasoline manufacture, for they usually find their way into the fuel after it has reached the car or in the funnels of the gasoline salesman.



No matter who is to blame, the annoyance is there just the same, and oftentimes one sees a motorist stopped beside the road with the carburetor removed from the car for cleaning. This is one case where prevention is better than cure. It saves much time and annoyance, and the motorist can make very easily a device, such as illustrated herewith, that will prevent any dirt or water from entering the carburetor.

A Gasoline Filter.

Obtain a 1¼-inch brass pipe nipple, four inches long, together with two pipe caps, one of which should be tapped for ⅛-inch brass pipe, make up a ring of copper wire just small enough so that it will slip into one of the pipe caps, and cut a circular piece of very fine copper mesh, as shown at B. A paper pattern should be made first, by rolling the paper inside the ring into a cornucopia shape, as shown at C.

When the size has been obtained, the mesh may be cut and rolled into the shape, as at C. This cornucopia mesh should be soldered to the capper ring H and placed in the pipe cap D, which should be screwed into place on the nipple, using plenty of orange shellac on the joint to prevent leakage. The second pipe cap G should then be put into place, and the pipe nipple tapped for a ⅛-inch type at F slightly above the edge of the pipe cap. F may then be connected with the gasoline line, and E connected with the carburetor.

In passing from F to E all of the gasoline is

A Home Made Gasoline Filter.

filtered by the cornucopia mesh C, and both dirt and water fall to the bottom and may be removed by unscrewing the cap G. For a slight additional expense the pipe cap G may be fitted with a valve for draining.

Recent Legal Decisions of Interest

Novel Automobile Fire Insurance Point.

A., in a deal for buying a new automobile, had left his old car with B. under a contract for its sale by B. at not less than $1,060, any excess above that sum to be divided between them. While in B.'s possession the old car was burned, and A collected $1,990 insurance.

In an action for one-half the difference between $1,060 and $1,990, B.'s petition alleged that A., by agreement, held the insurance policy as trustee for himself and B., each to have the same proportionate interest in the proceeds that he would have had in the proceeds of the sale of the car under the selling agreement. It was held, Waverley Sales Co. vs. Ford, 194 S. W. 1085, that this was a sufficient statement to render admissible evidence of an oral contract as to the keeping up of insurance at the joint expense of the parties for their joint benefit. The original selling agreement would not, of itself, entitle B. to any part of the proceeds of the insurance above the fixed sum of $1,060.

Scope of Chauffeur's Employment.

In an action against the owner of an automobile for damages, for the death of plaintiff's son in a collision between the wagon on which he was riding and the defendant's automobile, it appeared that the defendant's chauffeur took the car to a garage for repairs and afterwards, in company with an acquaintance, left on a pleasure trip in a direction away from the owner's garage, stopping at one or two places for drinks. On the way home he collided with the wagon. The Pennsylvania Supreme Court, Solomon v. Commonwealth Trust Co., 100 Atl. 534, held the owner not liable.

Collision—Effect of Settlement by Insurer.

An automobile owner was insured against loss, arising from claims for damages on account of bodily injuries growing out of accidents occurring while his policy was in force. He had a collision with the driver of another automobile, which was clearly caused by the latter's negligence. Nevertheless the latter threatened to sue the insured, and the insured's adjuster settled with the party at fault for $200. The insured sued the party at fault for damages. It was held, Burnham v. Williams (Mo.), 194 S. W. 751, that the settlement, which the insured had no hand in, he being forbidden by his contract to interfere with negotiations for settlement of claims, did not bind him and stop him from asserting claim for damages to his automobile against the party at fault.

Collision Between Automobiles—Driver's Duty.

The Connecticut Supreme Court of Errors holds, Wing v. Eginton, 102 Atl. 655, that in an action for injuries in an automobile collision, an instruction that, if the defendant saw that the automobile in which the plaintiff was riding as a passenger was on the wrong side and in a dangerous position, and the defendant could, in the exercise of reasonable care, have turned out further and avoided injury, it was his duty to do so, and that the question was only one of discretion.

Authority of Garage Night Watchman to Hire Car.

A motor company's night watchman, who had no authority to hire cars for it or employ chauffeurs, let out the car of another, which car, with his consent, was stored in the company's garage, and employed a chauffeur for the owner. The Kentucky Court of Appeals holds, Spradlin v. Wright Motorcar Co., 199 S. W. 1087, that the motor company was not liable for the death of the hirer due to the chauffeur's negligence or the defective condition of the car. Any person may keep his machine in a garage and hire or authorize its hiring to anybody he pleases, and when he does so and engages a chauffeur to run it, the owners of the garage are not to be held liable for what may happen on account of the negligence of the chauffeur or the defective condition of the car merely because the machine was kept in their garage, or because one of their employees, who had no authority to let out machines for them, but who was authorized so to do by the owner of the machine hired, engaged for him a chauffeur to run the car.

In and about every garage of any size there are many cars not owned or controlled by the garage people, and to hold them liable for everything that an unauthorized employee of theirs might do as the servant of some one else would unreasonably extend the limits generally applied in holding principals responsible for the acts of their agents or masters responsible for the acts of their servants.

Result of Boy's Interference with Brake.

A chauffeur set the brake of his employer's car and left it standing at a curb on a down grade. A boy rattled the brake, releasing it, so that the car started down grade, striking a person, who sued the employer. The Pennsylvania Supreme Court held, Rhad v. Duquesne Light Co., 100 Atl. 262, that the boy's interference was the cause of the injury, so that the defendant, even if negligent, was not liable.

Automobile Insurance—New or Second-hand Car.

In an action on an automobile policy of insurance against theft, it appeared that the plaintiff's employer purchased the car and delivered it to the plaintiff, title remaining in the employer until it was paid for. The New Jersey Court of Errors and Appeals holds that the car was new and not second-hand when title to it was acquired by the plaintiff, and so loss by theft was within the policy, which was based on an application stating the car was new; the purchase by the employer being as much for the plaintiff as if credit had been directly given to him by the seller.

Driver's Duty When Temporarily Blinded by Lights.

The New Jersey Supreme Court holds, Hammond v. Morrison, 100 Atl. 154, that a motorist who is temporarily blinded by the reflection of lights on his wind shield should stop his machine, and is guilty of negligence in proceeding blindly, and hence is liable where he ran blindly into a trolley car, catching the conductor, who was on the ground adjusting the trolley, between the machine and the trolley car.

How to Place and Distribute Advertising So That It Will Give Results

2—The Kind of Advertising To Use In Order To Bring the Best Results And Enable You To Get the Most For Your Money, Should Be Considered

BY FRANK FARRINGTON

When you have decided that advertising will help your business, the next thing is to decide what kind of advertising will help it the most—for the least investment. I don't mean that you are to try to find the way of getting out of it with the least possible expense, but you want to find the way of getting the most for your money.

What kind of advertising will pay you the best return dollar for dollar of investment? The answer to that question is the foundation of your business success.

Newspaper Advertising.

There are no kinds of advertising by which you can reach as many people as many times for a specified sum of money as by newspaper advertising. Setting aside the case of the comparatively small or neighborhood garage in the large city, the local newspapers offer the means of getting your message to the public with the least trouble and with the least expense possible.

The city garage that is small cannot afford to use the big city daily because the rate is too high. It is based on the total number of readers, and so large a proportion of those readers are not possible patrons that the waste circulation makes that paper out of the question as a medium.

The newspaper goes out regularly. All you have to do is to take your advertisement to its office and the rest is done for you. With most other forms of advertising you have to do the work as well as pay the bill.

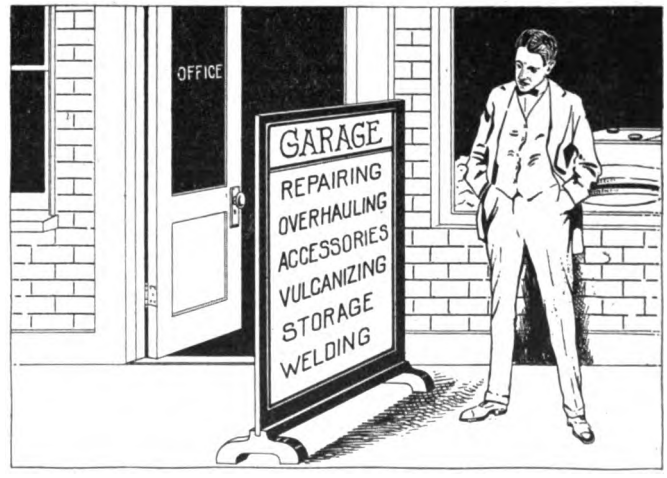
People expect to find advertising in the newspaper, and they look for it there. The man who does not advertise in the newspapers rarely gets credit for doing any advertising. With the exception mentioned above, the newspaper is the first place to begin to advertise. Other forms of advertising may be taken up when you get the newspaper space working properly, but the newspaper is your one best bet.

Newspaper Not Always Practical.

Of course not all newspapers are profitable mediums, and in every town where more than one paper is issued there is a best paper. Sometimes in a town supporting three or more papers there will be one which comes so near to covering the class of people you want to reach that it is not necessary to consider using any of the other papers. In other towns it will require the use of two papers to cover the population. It is rarely necessary, or even desirable, to use more than two papers, and when this is done, if they are daily papers, you can get practically the two paper influence at the one paper cost by using them on alternate days duplicating only at such times as you feel that your advertising is particularly important.

If you are in business in a town that has only weekly papers, no daily, you will probably want to use all of the papers unless there may be one that is obviously without circulation or influence.

The newspaper that has a bad reputation, like the garage that has a bad reputation, will not have a good class of patrons. It will not go to a good class of people, and it will not have the right kind of an influence with the people who do read it. In the same way, if you allow your advertising to go into a paper that prints all kinds of fake advertising, including lots of patent medicine stuff and get-rich-quick offers, mail order advertising and the like, you will be in poor company and you may be judged by the company your advertising keeps.



In addition to the newspaper advertising, there are various forms of advertising you will want to use because they are inexpensive and helpful, while it may be desirable to take up more intensive publicity plans after you get the newspaper advertising running smoothly and efficiently.

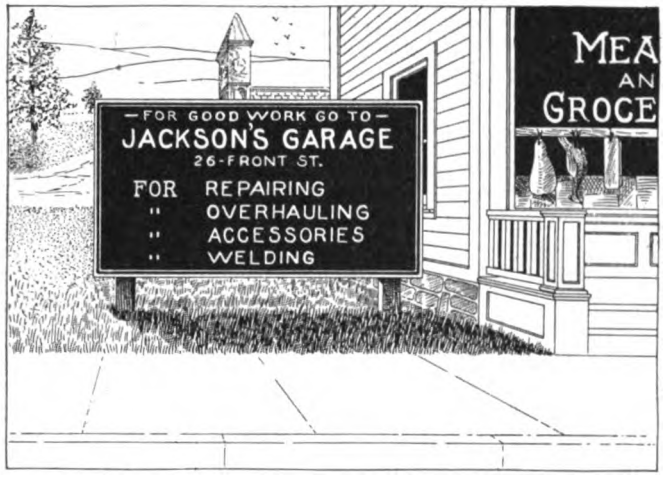
The other available forms of publicity include signs outside of the store, on the windows, or shades, or anywhere they may be used to advantage. Signs, after the initial cost is paid, cost nothing.

Bulletin boards have their uses, not only such bulletin space as you may have around the store, but such space as you can rent around town.

And right along the same line as bulletins and posters, are fence signs for use in the surrounding country; sign boards pointing the way and giving the distance to your garage, also guide-posts bearing your advertisement, and painted signs on roadside space—rocks, barns, fences, etc.

The distribution of printed matter to visitors in the garage and from house to house or in parked cars

Be Sure That the Passing Traffic is Informed as to What Can Be Done In Your Shop.



is worth consideration, and this will be discussed more particularly when a little further on we get to the subject of manufacturers' advertising helps.

The most important form of advertising, next to newspaper advertising, is no doubt the direct-by-

Digitized by Google

mail kind, the advertising you send to prospects and possible prospects.

It costs a good deal for postage on such advertising, especially if sent under letter postage, but it is

A Signboard Near a Grocery Store Will Be Seen; For Meats and Groceries Are Necessities.

worth something to get a direct personal message into the hands of a man who may be considering spending some money for the kind of supplies or service you have to sell.

Your mail advertising may be merely printed matter supplied by a manufacturer or it may be actual hand-written personal letters, or it may be and probably will be somewhere between the two extremes. At all events it can be made to produce business if it is well handled, and it needs the detailed consideration we shall give the subject in this series of articles.

It is easy to see, then, that there are plenty of ways in which you can advertise if you will, and as far as expense goes you can choose a method the cost of which is adapted to your circumstances.

Seasons Affect the Business.

Various classes of business which are affected by the seasons or which are brisk only during certain months of the year, as is the case with the automobile business, especially in the north, convey the impression that advertising in the dull season may not be necessary. The garage man may feel that for him to advertise in January and February in a state where the ground is deep with snow at that time is a waste of money.

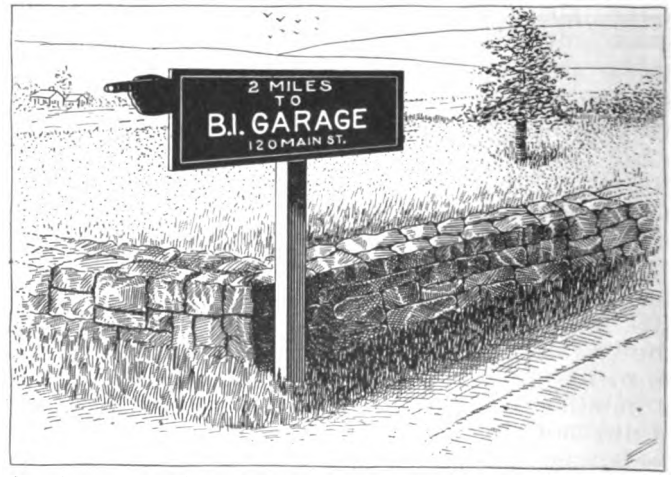
There should be no "off-months" in garage advertising, and if that is the case it will be found that the business will keep up much better while winter lasts. When people ought to be having their cars overhauled instead of waiting till spring to have it done, they will be the more likely to think of it and to appreciate the advantage of it, if they are being constantly impressed with the fact by good advertising along that line.

After all, there is just one good time to advertise your business and that is—all the time. Get your advertising going right away and keep it going. There will be seasons when you have more to sell, when there is more business to be had, and at such times you may want to do considerable extra advertising, but there will be no times when you can afford to cut the advertising down to such a stage that it will have no influence.

It is important that you keep the element of freshness uppermost in your mind in writing or in getting up any sort of advertising. You have seen advertisements for Christmas goods left standing until spring, and it is not so uncommon to see somebody's advertisement of hammocks or lawn mowers still eating its head off in the newspaper after snow flies. It looks just about as much out of place and just as shiftless, too, as it does to see the hammock left hanging on the front porch all winter, or to see the lawn mower standing in the yard beside the discarded Christmas tree, along in January.

People will not read old advertisements in the paper. Your advertisement is not as interesting to the public as a news item, and yet you know no one would think of reading over again and again, week after week, the same old news item or the same story.

Every time the paper comes out, see that your space is occupied by a fresh advertisement. There is nothing to the idea that somebody may see the advertisement next week after missing it this week. So they may, but that somebody will be influenced just as much by the new advertisement, and the new one will catch the old reader, too.



Then, people soon learn which advertisers are careless and leave the old stuff standing, and they cease to feel an interest in their space. They don't expect to find anything new there, and they don't look.

The only kind of advertisement that deserves to be left the same year after year is the sign over your door, and even that must be kept looking as fresh as paint will make it.

You wouldn't even think of sending out the same letter or even circular twice in succession to your mailing list any more than you would bombard a prospect with one copy after another of the same catalog.

It should be said right here that for the kind of advertising you are to do direct by mail, as well as for keeping in touch with prospects, you need to develop and maintain a carefully prepared mailing list, comprising the names of all possible or actual patrons of your garage.

To be without a good mailing list is to be without one of the best of means for developing business, and the mailing list ought to be something more than a mere list of a certain number of people living in your community. The names should all be

Advertise Upon Signposts in the Country Where the Touring Motorist Passes.

Digitized by Google

classified so that you can take up with any group or with any individual any desirable proposition.

As the mailing list is made up each person's name should be checked in such a way as to show, if possible, what kind of a car that person has, if an owner. It should show the person's occupation, financial standing in a general way, residence (city or country), married or single, and any other items that have a bearing on your business.

You can make the list on sheets of paper with columns after the names, the columns being headed at the tops so that a check mark after the name in the proper column will give the information. For maintaining a list of prospective car purchasers or of actual customers about whom more information is needed, a card index is better. The mailing list ought to be made in duplicate so that loss or spoiling of a copy will not interfere with your work along that line. A good mailing list is a valuable piece of property to any garage man who wants to develop his business.

One class that ought to be indicated on your mailing list is that of people you know to be habitual mail order buyers, people in the habit of sending to the mail order houses for goods. These people will sooner or later order automobile supplies in that way, because they are receiving more or less catalogs of such things.

You need not start out with a big mailing list. The list should be built up carefully with a view to keeping from it all useless names and dead wood. It costs money to mail advertising, and every useless name on the list means a waste of actual money.

To begin with, have your list of customers. To this you can add, from memory, many names of people you want for customers. Further additions can be secured by making trips over the R. F. D. routes and taking names from the mail boxes. City directories and telephone directories are a source of names and by checking up the personal news items in the local papers you will be able to secure more names. In this latter way you can get the names of new families moving in—a particularly good class of prospects if they own cars, because they are looking for a garage at the same time you are looking for customers.

Your list should be watched all the time for corrections. People will die or move away or cease to be prospective customers. As far as addresses are concerned, the post office can check up your list and cross off names to whom mail can no longer be delivered, but it is against the rules of the department to add any names to a list. Take your list to the post office each time before you make a mailing and save the loss of postage on mail to folks no longer in your territory.

By co-operating with some merchant in a non-competitive line, you may be able to add to your mailing list. Each of you will be able to help the other on his list. In some towns the chamber of commerce maintains a complete list for the use of its members. This, if available, would be a help in making out your list, which has to be more highly specialized than most.

The work on a mailing list can be done at odd times by anyone who can do the work properly. If you have a bookkeeper, it will fit in with her work. Every employee connected with the garage ought to be asked to make a note of any new names that ought to go on the list, and if you all keep your ears open you will pick up many a prospect in this way.

Instead of leaving the addressing of envelopes until they are needed, have a pile of envelopes and the mailing list at hand in a convenient drawer and make it the business of the proper person to utilize spare time in addressing envelopes. In this way there will always be a set entirely or at least partly addressed for use, and when there is advantage in getting out something very quickly the envelopes are ready, and that much time is saved. The time is saved almost entirely, too, because it is more than likely that that same time would be idled away if the addressing job were not waiting.

THE POOR LITTLE RICH BILL.

BY GLADYS SCHUSTER.

"Who are you?" our editor said yesterday, when a sick-looking stranger appeared before him. "You look a bit familiar, although I'm sure I haven't seen you for some time."

"I'm a Dollar Bill," the stranger answered weakly.

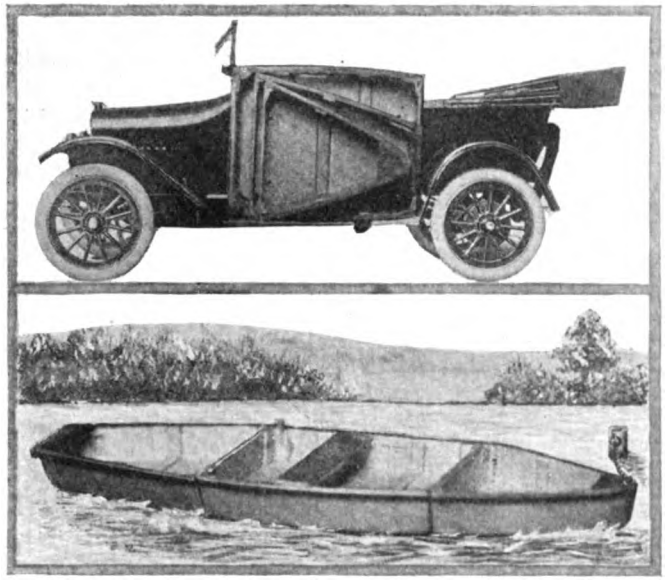
"Oh—pleased to recognize you, Dollar Bill," cordially beamed our editor, holding out his hand. "You look a bit sick, old friend. What's the matter?"

"I'm not the same Bill I used to be," mournfully said the visitor. "I can only do about half the work I used to do before the war."

"Pretty tough," our editor reflected. "Have you been to see the doctor?"

"I went to see Dr. McAdoo," answered Bill, "and he told me that I'll never get my strength back until after the war. He said I ought to gain at least 25 or 30 cents in weight then. In the meantime, he said, I ought to have a rest, and my owner ought to lay me aside against the day when I will be worth more."

"That isn't a bad idea," observed our editor.



"I know," continued Bill, "that some of us Bills must go for food and clothing, no matter how weak we get. But there are lots of us that are going for luxuries and things that our owners don't really need. The fast times are killing us. I thought if I called it to your attention, you might say a word for us. Dr. McAdoo said a dose of publicity would help me. Now of course I don't want people to put me in a sock, or behind the clock case, until the Huns are defeated. My value will increase by investing me in absolute safety."

"How, for instance?" asked our editor, sympathetically.

"If you take four of us and add 15 cents to us this month, making $4.15 in all, you can buy a War Savings Stamp from Uncle Sam that will make me worth exactly $5.00 cash to you on January 1, 1923, and worth even more when you consider how much more $5.00 will buy then than now. There is nothing imaginary or theoretical about it, either. We Dollar Bills are valuable only because we can buy things people want. I am more valuable when I can buy more of those things than when I can buy less of them. And Uncle Sam will gain while you gain. He will have the use of your money when he sorely needs it, and believe me, he needs it. And I, Mr. Dollar Bill, will have the patriotic feeling that we have worked together for victory."

"Bill, you know what you are talking about!" exclaimed our editor. "Everybody ought to follow your advice."

A NOVEL ARRANGEMENT.

Mr. G. M. Clark, of Battle Creek, Mich., has recently had patented a novelty boat which should be of great interest to the automobilist who takes his vacation in his automobile. This sectional boat is illustrated herewith and consists of three parts, a triangular shaped front, a center and a stern section. The boat is made of wood and each section is water tight in itself. The parts are so arranged that they may be bolted together in a very short time, and when completed the whole device is very practical.

Mr. Clark says that his idea was suggested to him by a friend while he was on a fishing trip about a year ago. He was traveling through the country in his automobile and tried at a number of places to hire a boat, but was unsuccessful. He is a pattern maker by trade, and immediately acted upon the suggestion, so that now he never has to worry when he desires to go fishing, for he carries his boat along on the running board of his car.

Remodeling the Ford Car For Speed

Suggested Body Design and the Few Changes Necessary Before This Universal Car Can Be Put in the Racing Class

About this season of the year the younger car owner, of the family, has an idea that he would like to make his Ford car just a little faster. If he owns the car himself he undoubtedly intends to do this sooner or later and is wondering about how much work must be done before he can accomplish the result.

Two great changes are necessary in the Ford car before it can be made into a racing model. The first thing that must be changed is the body. Neither the touring or the roadster bodies are designed for speed. The lines are square from front to the back and the resistance to the wind is considerable. The body must be made so that it will cut the wind, so to speak, and not cause too much of an "eddy" current at the rear. We have our lessons in body building from boats, and find that in general a shape which is considered a fast body design is equally efficient for an automobile.

Accompanying this article are a number of sketches, suggestions for a fast Ford body, showing a view from the top, the side, the rear, and the front in A, B, C and D, respectively. From the dashboard to the rear, the body is made from three pieces of sheet iron. The top piece, as shown at A, has a large square hole cut through it for the driver's seat. The two side pieces require no cutting. At intervals, pieces of L-shaped strap iron should be used to hold the parts together as well as to the frame. Instead of using L-shaped strap iron, a piece of iron may be bent to conform with the shape of the sides, and both the sides and the top riveted to it.

Of course, the angle iron is much heavier than the ordinary piece of L iron, and though this offers better construction, it adds a slight amount of weight to the chassis.

The body may be made at one side and placed upon the car after the seats and the tank have been put into place. The body should be provided with L-shaped castings and fastened to the chassis in the same manner as the ordinary Ford car is fastened. The gasoline tank should be placed directly in back of the driver's seat, and in conjunction with this, a force feed or vacuum system should be installed, together with a suitable pump on the dash. The frame itself requires little or no alteration.

A great mistake is often made in boring holes at various parts of the frame to reduce the amount of metal. As an actual fact, however, loss in weight is so very slight that it is immaterial. The stock semi-elliptic springs should be removed from the gear and four platform springs installed instead. This permits the dropping of the body some two or three inches.

A special type of spring hanger for the front axle is illustrated at G, and the rear spring is retained to the axle by a bracket, as shown at E. The ordinary Ford mudguards and fenders are altogether too heavy to be carried around, though the driver should not make the mistake of discarding fenders entirely for the very reason that pieces of gravel, sticks or metal are apt to be picked up by either the front or rear wheels and thrown into the driver's face, sometimes causing severe injuries. The fenders illustrated may be made of thin sheet iron and held in place by the regular Ford brackets.

The design shows the regular Ford radiator as is used at the present time, and in the writer's opinion this radiator may be used very effectively on a speed car, though if one desires, a special pointed radiator may be obtained.

In order to preserve the pointed effect with the present radiator, a new engine hood should be made somewhat after the pattern shown at F. The old engine cover may be taken off and the hinges used for the new one. The new hood should be provided

Digitized by Google

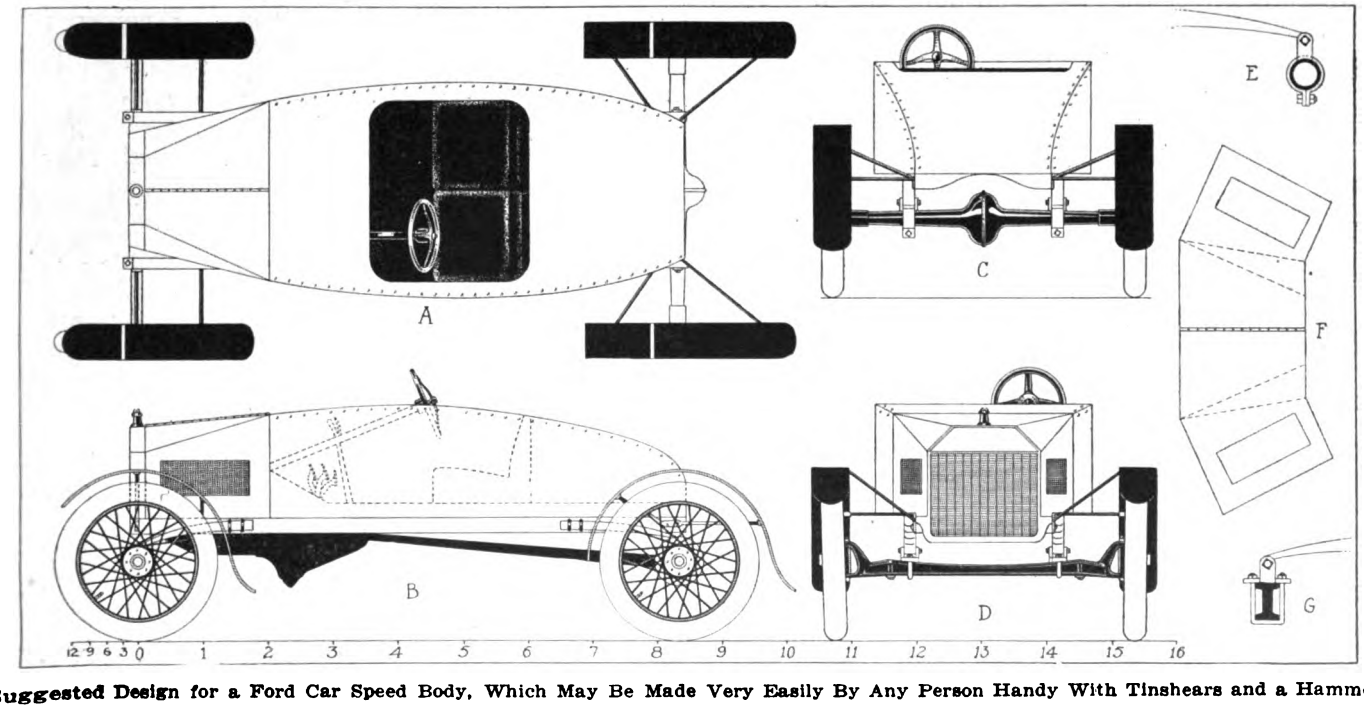
with an opening on each side to permit circulation of air, and these openings should be provided with a coarse mesh screen to keep out such sand and gravel, but not fine enough to prevent circulation entirely. As far as the chassis and body are concerned, these changes are sufficient for speed purposes.

The car mechanism should be altered considerably, however, and these alterations are, if anything, more important than body changes.

Another article in this issue deals with the change in the gear ratios of the rear axle, and in it the statement is made that 1,000 revolutions per minute is the maximum engine speed for full efficiency. One of the reasons for this is that the valve operation at higher speeds does not give satisfactory results, and for this reason larger valve area should be provided. This is usually done by installation of a special 16 valve head, such as sold by the Laurel Motors Corporation, and with this device higher engine speed is obtainable.

The second method of boring the valve ports and valve seats and putting in larger valves is not practical because the area is not increased sufficiently. Then again there is the danger of cutting through the water jackets, for there is but little metal at these points between the valves and the water jackets.

Considerable additional volumetric efficiency may be obtained by boring the cylinders slightly larger and installing new pistons and rings. Where this work is done, leakproof rings should be installed rather than the plain bevel cut ring. One will find that by installing aluminum pistons much of the vibration is removed, and, therefore, the engine can be run at higher speeds. Many drivers make a practice of removing metal from the connecting rods themselves by boring small holes in the weight of the rod. Any amount of metal removed from the reciprocating parts is worth while, though one should be careful not to reduce the strength of the parts in question.



With a body such as we suggest, there should be no need for dropping the engine below its present position, for the center of gravity of the car is plenty low enough, and the writer has seen a Ford car prepared in this way, attain a speed of from 75 to 90 miles an hour without any trouble from center of gravity. In addition to the present Ford lubricating system, an auxiliary tank of lubricant should be provided and fitted with a pump so that the driver or his mechanic may replenish the lubricant without stopping the car. An ordinary tank on the dashboard, fitted with a force pump and a tube leading to the oil base, answers the purpose very well. The thermo-syphon cooling system is not always efficient at the higher engine speeds, and some form of circulating device should be furnished.

Although the Ford magneto answers the purpose very well, much weight can be saved if the permanent magnets and the spools are removed and the engine fitted with a high tension magneto. The weight of a magneto is considerably less than the weight of Ford coils and the Ford magneto.

If the machine is to be used for racing purposes only, much of the weight may be lessened by changing the transmission. By this, we mean the removal of all of the present transmission parts, except the flywheel. If this is done, a connection must be made between the flywheel and the propeller shaft inside a transmission. The housing necessarily must be left in place because it carries rear engine supports, but the gears and the cones may all be taken out.

When this is done the car can be started only with the help of a number of assistants by pushing it along the track. This may sound rather absurd, but where plenty of assistance is obtainable, the gain is worth while.

Another point in remodeling the Ford car for speed is the change in the present Ford gear ratio. Gear ratios are sold by the Krom-Nik Gear Company, and in this issue is published a story dealing with gear ratios. For this reason we will not dwell upon this particular phase of the design.

Suggested Design for a Ford Car Speed Body, Which May Be Made Very Easily By Any Person Handy With Tinshears and a Hammer.

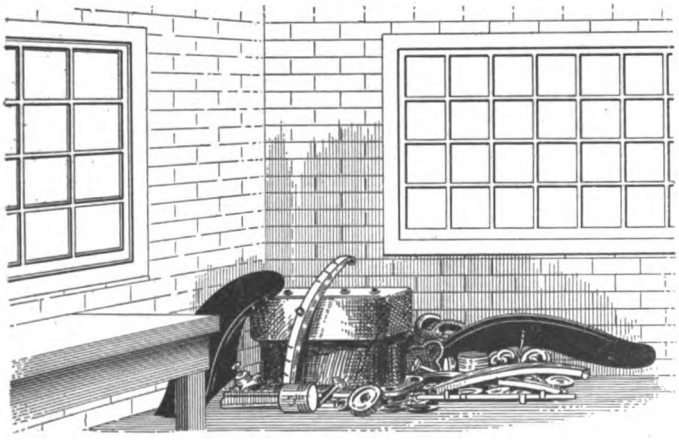
Keeping Ahead of the Scrap-Pile In a Small Repair Shop

Ways and Means of Utilizing Junk Parts and How to Keep Them In a Systematic Manner So As To Save Time and Money

BY W. A. MANN



Continuing to write, as in preceding articles of this series, mainly for the man who is in need of a kind of information that is rarely to be acquired without more or less extended experience, it may be pointed out that the average small garage or repair shop is by no means economical of the space at its disposal. Space is wasted eight times out of ten, and as space has to be paid for in money, it follows that money is wasted.

Should any big establishment be operated, or should anyone be so foolhardy as to try to operate a big place, in the disorderly way in which small places too often are run, the result would be simply disastrous. The only reason the small shop proprietor "gets away with" things as he does is that the smallness of the business and the limited space do not permit the disorder to get so big that the boss can't remember, more or less, where everything is, or so that a search cannot be made without much delay.

But in a disorderly shop, no matter how small, it is utterly impossible that delays and inconveniences should be avoided. It is a fact well worth remembering that it is a difficult thing to think of an orderly, well-kept shop that goes out of business through any fault of its own. Just try and think of such a shop; it is almost impossible, and the fact tells a tale of its own.

Orderliness a Big Factor.

Orderliness, the principle of having a place for everything and putting everything in its place, has more than an indirect connection with making money. In all verity, there is a direct connection, for there is direct profit in being orderly and systematic, and this is not hard to prove. Unfortunately, it is no simple matter to get one man to lay his course in the light of another's experience. In other words, a man usually insists upon learning by his own experience, and this, in its turn, usually means that he must profit by his own mistakes.

From Day to Day the Pile of Junk Increases in Size; a Valueless Nuisance.

In these times of very high prices for everything the shop must buy, however, there is abundant reason why every step leading toward economy should be taken, and one of these steps is economy in materials. When a shop starts out in business, brand new and without a finger-mark on the whitewash on the walls, there is likely to be very little material in sight except what the proprietor has paid out his real money for, and naturally he does not pay out any more of that real money than he considers necessary.

It is not long, though, if the shop does any business at all, before the bare corners begin to get filled up. First it is a bit of a broken spring, perhaps, or a twisted fender iron, or a hopeless rim, all by itself. Then someone gets hold of another scrap of something or other, and doesn't know just what to do with it, and he looks around and sees the first bit of junk, and with a relieved expression adds his contribution.

First thing you know there's a regular scrap-heap there, and if nothing is done about it it stays there, and in time it becomes an institution, and what is at the bottom goeth beyond the memory of the boss. And as that corner is, so other corners are, and likewise the spaces under the benches and every other space that is not permanently occupied by a machine tool or a bench or something.

What Did He Do With It?

Sooner or later the time comes when a man remembers that a month or so ago he had a piece of scrap that would just come in handy for this or that job. He scratches his head until it becomes sufficiently sensitive to remember that it must have been thrown into that pile of stuff over behind the grindstone. No one knows how much has been dumped on that particular pile since; but he wants that iron, and he goes after it like a terrier after a long-buried bone. After he has spent time enough to have paid for a new piece of material, maybe he finds it. Maybe he doesn't.

Now there is one phase of this every-day proceeding that is good and one that is bad, and there is a good deal to be said on both points. Coming first to that which is good, it needs no long argument to prove that the economical instinct is a highly praiseworthy one. It always was, but just now it costs so like the mischief to buy material, that everything which can be rescued from the scrap-heap is doubly valuable. In fact, as will be shown, there are cases where it may be a good deal more than doubly valuable.

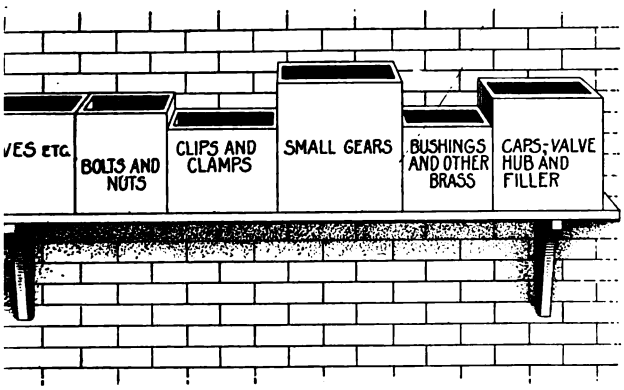
Take Care of Scrap.

The first thing to do in order to make the most of what commonly, or at least frequently, goes to waste, is to arrange to take care of the scrap from the beginning, so that there shall be no accumulation in corners and no wasted space, and so that a man will know where to go for anything in particular that

Digitized by Google

wants. For let it be remembered that it is not at hard to dissipate all the economy that comes from ng up old material by wasting time in hunting it.

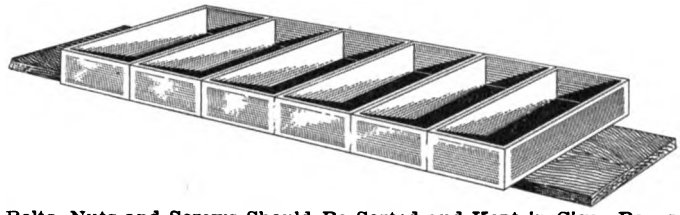
f a man's time is worth 75 cents an hour and he s up half an hour hunting for something to save nding 20 cents, it is a mighty wasteful operation, en the loss of money, which is not very serious in case alone, is added to the fact that the job is back half an hour at the very least, and prob- y more, by the time the scrap is worked into pe.



crap should be kept, if it is worth keeping as sible raw material, so sorted that it will be short k to find anything that may be needed, or to out if there is nothing of the sort that is wanted he shop assortment. It might be well to add to list of money-wasting economies the time lost ting for things that do not exist, or that did t and have been used up, or that can't be found use of the lack of order.

The Useful and the Useless.

he first thing to do is to provide plenty of places everything that may accumulate in the way of p. And just here it may be well to explain ex- y what we mean by scrap. Scrap, as we refer to ere, is not necessarily broken metal and smashed arts. It may be anything that is discarded after g a job, or that is partly damaged in some way, its of metal that are too small to be classed as k, etc. All this is in addition, of course, to what ly is scrap, such as broken parts.



here is certain stuff that is not worth giving e to. Badly crumpled fenders and other sheet al scrap is of so little use that it is not worth the e amount of space it requires. Sheet brass, er, German silver, or aluminum may be saved a time, for they have a high value per pound as e junk, and ought to be carefully preserved down he last ounce. But the big bulky "tin" stuff, h is so often seen decorating shops, should be osed of with the least possible delay.

efore it is thrown out, however, or sold, if a market can be found for it, it is worth while emove braces, brackets or other irons that may ttached, if they are readily removable. Occa- lly a new fender iron is wanted, and it is not

Parts May Be Kept in Boxes, Neatly Labeled, on a Shelf.

ys easy for the small shop to get one at a mo- 's notice. With a few old ones on hand, how- it often is possible to pick out, if not a com- one that can be made to fit, perhaps two halves can be welded together. The same holds good regard to lamp and other brackets, brake rods, which often have clevice ends that are worth saving, steering links and other connections, brake bands, which often have end-connections that may serve useful purposes, pieces of shafts and tubes

Bolts, Nuts and Screws Should Be Sorted and Kept in Cigar Boxes, Which May Be Fastened to a Long Board.

of various sorts (tubing is valuable stuff under many conditions), valves, valve springs, etc. We will have something more to say, however, later on as to how some of this so-called scrap can be turned to account.

The Bin System.

The first step is to select places for keeping scrap and the second is to put in the necessary bins and boxes. The more the material is divided up the easier it will be to find any particular thing; but it will not do to make the subdivision so fine that it will be a sort of filing-clerk's job to figure out where anything belongs. There will be pieces of all sizes to take care of, and the little things must be kept by themselves. There is nothing in the world harder to find than a valve key, for instance, somewhere in a box with broken springs, old gears, perhaps a few old rims and the remains of a radiator for good measure.

It will be found profitable to start a series of small boxes for the smaller things, and for the purpose there is nothing better than cigar boxes. It will save time to rip off the covers. One way to handle cigar boxes is to nail them to a board in a row, or to nail them to boards in groups of from four to eight. This makes it practically impossible for a box to be carried off and left some place where the next man who wants it can't discover it.

The groups should be put on shelves low enough so that the contents can be "pawed over" conveniently. In these improvised bins can be stored odd machine screws, small bolts, nuts of odd sizes and threads, washers, lock washers, valve keys and other small keys, small springs such as are used in carburetors, carburetor parts, magneto and other electrical parts, battery terminals, switch parts, etc.

In fact, there is a great variety of parts that can be kept in this way. A convenient way to classify them would be to keep all the electrical stuff by itself, say in one or two groups of boxes, keeping the magneto and other ignition parts in one set and the starting-lighting material in another group. A separate box or two might be used for brushes and brush springs. Carburetor parts might well require a group of boxes.

Special attention may be called to the importance of taking care of such small parts as these. It is worth a great deal of bother, sometimes, to be able to find a part for some carburetor, magneto, or generator, that has gone out of busines, when it is badly needed. Even if the part is not new there are cases where it can serve a purpose by keeping the machine running until a new one can be obtained.

It is of course impossible to keep a stock on hand of new parts for every emergency that might arise, and the man who is prepared, as far as possible, for

Digitized by Google

such emergencies is likely to be a valuable man to his patrons. Electrical brushes and brush springs are a case in point. A half worn brush will keep a generator or a magneto going, for the time being, just as well as one that is new, and if the boss knows where he can lay his hand on all the old brushes in the shop he may do his customer a good turn and also boost his own reputation.

Bigger Boxes for Bigger Things.

Boxes of a larger size are required for larger parts, as a matter of course. Good substantial grocery or hardware boxes can be obtained readily for this purpose, and as these are not likely to be carried around much, if at all, it is hardly required that they should be nailed down. This group of boxes may be used to hold old valves and valve springs, pump parts, small gears and shafts, bushings and bearings, radiator and other filling caps, hub caps, spring clips and clamps, small brackets, large bolts, nuts and washers, valve cages and caps, guides and other odds and ends of something like the same size classification. These boxes also may be stored on good substantial shelves.

(To be continued).

Repair and Adjustment of Brakes

From A Safety First Standpoint, These Units Are the Most Important Parts of a Car, Yet They Are Too Often Neglected

BY M. J. HENNESSY, M. E.

The most important and usually most neglected parts of an automobile are the brakes.

There are two kinds of brakes—good brakes and other brakes, and it is of vital interest to every man, who drives an automobile, to see that his brakes come under the first classification. Bad brakes are responsible for numerous troubles. For example—if they are adjusted in such a manner as to cause one or both wheels to slide, when they are suddenly applied, the result is a torn tread on one or both tires, and possibly a blown-out shoe; unquestionably a blow-out, if the performance is very often repeated. There is no rubber tire made that will stand being dragged along a hard road while held in one position.

A man would hesitate a long time before he placed the tread of a new tire against the edge of an emery wheel which was spinning at eight or nine hundred revolutions per minute. On the other hand, the same man will, without hesitancy, apply the brakes on a rapidly moving car and produce the same effect on his tires as if he had used the emery wheel. In fact, the wear is greater, as the pressure caused by the dead weight and momentum of the car is far in excess of any pressure he could apply to the tire on the emery wheel.

Strain on the Car.

Then there is the terrific strain on the entire car due to a too sudden application of the brakes, and it is well to bear in mind that this strain affects every part of the machine. Even the body bolts, the top and the windshield supports, are not exempt from the strain, as a moment's consideration of the subject will prove. This is but one class of bad brakes. Another, and by far larger class, are those which are best described as "No Brakes." The causes of this condition are many and varied.

The commonest cause of brake trouble, in the experience of the writer, is that which is due to stiff operation or entire lack of operation of the flexible joints in the linkage between the control levers and the brakes themselves. When an automobile manufacturer goes to the expense of putting a clevis and pin in a certain place in the brake assembly, one may be quite sure that a flexible joint is necessary at that point. Therefore, it is up to you to see that the joint remains flexible.

Another great source of trouble is the brake drum. The money expended and wasted every year in putting good brake linings against bad brake drums would prove an extraordinary and beneficial item towards the support of our Liberty Loan.

Brake lining is usually a composition of woven asbestos fibre and wire. After a period of use, the wire strands become broken and present innumerable short sharp points to the face of the drum. These points cut into the surface of the drum. If you should take the trouble to examine a piece of worn brake lining with a magnifying glass you would be apt to wonder that the brake drum lasted as long as it did.

Now for the remedy. You can turn or grind the drum down to a true surface again. This, however, is a slow and costly process. On account of the large diameter of most drums in general use, the lathe has to be run at very low speed. Then again, on account of the egg or oval shape of most drums that have seen hard service, the cut has to be very light, and if the scores or grooves in the drum are very deep, and the drum is double faced; that is, if it serves for both an internal and external brake, as most of them do, there will be very little stock left and the drum may possibly collapse under pressure.

The New Lining.

If you are satisfied as to the stability of the drum when it is turned down, the next feature for consideration is the new lining. Manifestly, having reduced and increased the diameters of the drum, you must correspondingly reduce and increase the diameters of the brake shoes. Although there are other ways of doing this, the only successful way, in my opinion, is by the use of thicker lining, and very often you will find it extremely difficult to get the required thickness.

All things considered, it is a much cheaper and by far a better proposition, when the brake drums show signs of wear, to buy new drums from the maker and keep the details of the car as near standard as possible.

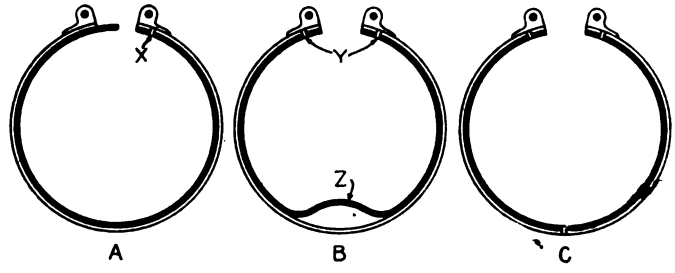
It is well when ordering the drums to order a complete set of bolts for them, as it is seldom possible to save either the old bolts or nuts. In attach-

Digitized by Google

ing the new drums one should be very sure that every bolt is pulled up tight so that it will always stay in that condition. A loose brake drum can cause a very disagreeable noise and with constant use will necessarily get worse.

Use Care in Riveting.

In attaching the lining to the shoes or bands, care should be taken to have the rivet heads sunk as deeply as possible. When the countersinking is done on a drill press, the press should be set so that all the holes will have a uniform depth. If the work is done by hand one can make a guide by boring a hole in a piece of wood of such a size that it makes a sliding, fit on the shank of the countersink, allowing the bit to project as far as the rivet head is to be sunk. It is a good plan to use a drill one gauge size smaller than the rivet. Too much care cannot be exercised in making the lining lie close to the band. The surest way to attain this result is to cut the lining to the correct length and rivet both ends to the band first, then press the lining into place along the band and hold it in place with a couple of small hand clamps.

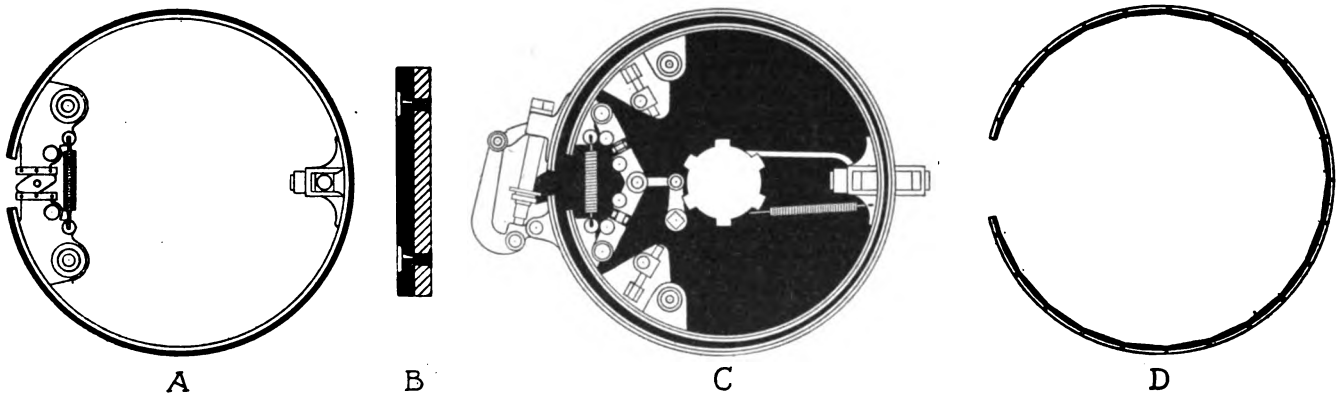


If these useful tools are not at hand a few pieces of soft wire twisted around both lining and band will serve the purpose. In setting up the rivets take a piece of round stock, the point of which is the same size as the head of the rivet, have it long enough to rest on the horizontal part of the vise and to project far enough above the jaws so that no matter which rivet one is working on, the band will always clear the vise—this to avoid spoiling the shape of the band; hold the brake so that the rivet head rests solidly on the round bar, use a "light" hammer and "draw" the rivet; by that I mean, hit it squarely and lightly until it fills the hole in the metal band.

No matter how nice a rivet looks, if it is not properly "drawn" it may as well not be there.

Replacing the Wheel.

After applying the lining the brakes are ready to be assembled. Before doing this, place one of the wheels against the wall, or anything solid, with the drum toward you; slip the band over the drum, draw the two ends together as tightly as possible and fasten them with wire or string. Now look carefully all around the drum and see that the band fits snugly. If there is a space between, at any point, "peen" the band at that point until the space disappears. Having seen that the bands are the correct shape, you will now attach them, making sure that all pins, bushings and slides are perfectly clean and well oiled.



Too much stress cannot be laid on the necessity of having all clevis pins work freely. Every clevis pin in a braking system should be put in place with the fingers; never with a hammer. See that the male member of the clevis is in perfect alignment with the female. If one or the other has to be twisted with a screwdriver or other implement, it will not work freely and should be adjusted so that it will. When you have made sure that the bands are placed properly and all pins, releasing springs and anti-rattlers are in place, put on the wheels and proceed to make the adjustments.

Three Steps in Relining a Brake Band. The Fabric is Riveted at X; Then at Y, Leaving an Excess Bend at Z; Then at C.

On cars which are equipped with full floating axles it is well to leave the axles out until all other work is finished. In all cases I would suggest leaving one set of brakes entirely free until the other set is finished. There are a great many different cars in use and, personally, I do not know of any two, the details of whose brake adjustment are alike. It is therefore impossible to go further into particulars of the operation. The final essentials are the same in all cases.

If you have good brakes the wheels should be perfectly free when the brakes are released. Dragging brakes not only wear themselves out, but cause a waste of gasoline and tend to wear the engine. The brakes, when applied, should exert exactly the same amount of friction on both wheels, thereby reducing the chances of skidding to a minimum and saving wear and tear on the tires.

A, Shows an Internal Expanding Brake Band; C, Both an Internal Expanding and an External Contracting Band. Rivet Heads Should Be Kept Below the Surface as at B. A Poorly Applied Band Shown at D.

Foreign Subscriptions	$1.50, or 6s. 3d.

Remittances should be made by Express Money Order, Draft, Post Office Order, or Registered Letter. Foreign remittances, where possible, by International Money Order.

ADVERTISING RATES MADE KNOWN ON APPLICATION

NEW YORK, MAY, 1918.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

CAUSE FOR LEGISLATION.

Our first story in this issue deals with automobile accidents, caused by carelessness, and it is interesting to note that out of 36,596 chauffeurs applying at the New York City offices for licenses in 1917, 6,394 were rejected after a road test. Two hundred and twenty-two women chauffeurs were given licenses.

It is not to be wondered at that the accidents in the country are increasing steadily. If only five-sixths of those applying for licenses are capable of driving cars, what must be the condition in some of the other states, where licenses are obtainable simply by mailing the fee to the commissioner of public roads.

The country today is facing a serious situation, and legislation is the only solution to the great problem which confronts us. We must reduce automobile accidents, but we cannot reduce them unless we reduce the number of inefficient automobile drivers.

Every state has its police department, for which they pay a considerable amount of the public funds for the purpose of keeping law and order. With the increase in the number of automobiles driven on the public roads, it becomes imperative that every state look to their automobile and roads departments. The point has been raised that were a road test incorporated in the automobile registration requirements, considerable money would be required. Doubtless this is true, but we feel that it is not a question of money, but a question of life.

The figures given above by Secretary of State Hugo, relative to the New York rejections, should be a lesson to the officials of other states. A driver who is not capable of running an automobile is a menace to the community. He is just as much of a hazard as a burning building, except that he is a menace to life, whereas the burning building is simply a menace to property; is there any comparison?

A driver who has contributed to an accident, by carelessness, because of intoxication, or through negligence, should have his license revoked; if not permanently, for a certain period of time. The public must be protected, and this protection should be had through the state departments.

FRIENDLY KINDNESS.

We know that our readers like our magazine, for we constantly receive enthusiastic letters from them. We know that you obtain much information from it and we intend to make it better with every issue. If you like our magazine, why don't you tell your friends about it? In this way you will be doing a kindness to them, helping us, and favoring yourself, for as our subscription list grows so does our magazine.

YELLOW DOGS.

In a recent issue of the Saturday Evening Post there appeared a story, called "The Yellow Dog," dealing with a peculiar situation in this country. The American people, as a race, have one big fault, and that is to gossip. Perhaps the real reason for this, is that our land is one of freedom. Without making libelous statements one may say just about anything he pleases without coming under the law. Free speech is encouraged and as a whole it is necessary. Free speech, however, does not mean gossip, and by gossip we mean the little harmful statements which one is apt to make against the Government.

Assume, for instance, that Mr. Browning, who is a confirmed pessimist and never agrees with anyone, does not like the way a certain situation is handled. His sources of knowledge relative to military movements is limited to within a radius of a few hundred miles. His information is obtained from the local newspapers and a few magazines. His judgment is based upon local conditions, and while going to his work some morning, he rides down with one of his neighbors. He tells his neighbor that he does not think the United States is meeting the situation properly. He does not think that we are sending enough men across. Although his neighbor may know that Mr. Browning is a pessimist, the statement has a certain amount of weight with him and he is very apt to repeat Mr. Browning's statement to someone in the office, bringing about a general feeling of discontent among two or three people.

Pessimism is a weed in the garden and grows like a weed. Sooner or later many people in the town have heard Mr. Browning's statements and as they have the same source of information that Mr. Browning has, arrive at the same conclusion.

Little colonies of this sort sprinkled throughout the country result in general discontent, and this is just what the Germans like to have. The next

Digitized by Google

time your neighbor tells you of some fact which seems to show Government inefficiency, do not repeat it. The heads in Washington are just as anxious to win this war as you are. They will make mistakes, it is true. So do you. If you cannot boost America, better keep quiet entirely because every word you say against her is in favor of Germany.

Stamp out the seeds of dissatisfaction and the weeds of autocracy will soon die of themselves.

A TAX ON EDUCATION.

Unless something is done very soon, upon June 1st a law will go into effect which will result in the crippling of many of our magazines. We speak of the increase in postal rates.

At the present time our magazine may be forwarded from New York to Washington at the same cost as from New York to New Jersey. Under this arrangement, subscribers living in cities and towns away from the publication centers have the same advantage as those living at the publication centers. Under the new rate, however, there will be an increase in the cost of postage in some cases to nearly 800 per cent. of what it is at present. Do you think that it is fair for you to pay twice as much for your magazine if you live in California than a subscriber in New York? Doesn't this seem a bit unfair? Doesn't it seem as though a tax were put upon knowledge?

The education of a great number of people in this country can be traced to the magazine. Newspapers simply give general information relative to past and present events. It is not educational in the true sense of the word, whereas the average magazine is purely educational. Because of the fact that the present postal rules are so well drawn up, the price of magazines is low.

Few of our readers realize that their present subscription price barely pays the cost of postage. To meet the demand for higher postage rates many magazines will be forced to increase their subscription rates and therefore many subscribers will be lost.

We receive letters daily telling us that our readers will gladly pay increased subscription rates rather than lose the magazine, but we do not think that such a step should be made necessary. We do not feel that the reading public should pay a price for their knowledge and so we want all of our readers who have not already done so, to write to their Congressmen at Washington, asking for a repeal of this law. The Congressman's name may be ascertained from the local postmaster.

KEEP YOUR CAR IN CONDITION.

The production of new automobiles has been cut down to a very great extent and rumor would seem to indicate that the production might be cut down still more. For this very reason every automobile owner should do his best to keep his car in condition. The year bids fair to be one wherein the used car will predominate.

In former years many owners were prone to discard their old cars for new ones, but this year the supply will not be any too large to fill the demand of new purchasers. If you are a repair man, now is your opportunity, and you should take advantage of it. It is your chance to make a name for yourself. If you do good work you will surely succeed and your reputation will grow better, because of the fact that you will have so many customers.

If you are a car owner you should read the magazines and get acquainted with your car. The Automobile Dealer and Repairer is written from a practical standpoint. It is written in plain English and in such a way that every reader may understand the repair of automobiles without any difficulty.

In every issue we intend to take up the repair or maintenance of some part of the car and explain the work so thoroughly that any reader with mechanical ability may do the work himself.

IDEA EXCHANGE.

Not long ago our editor was in a small garage, where the owner was particularly alert. The owner looked after the interests of his employees and used his brains. If the employees brought forward any particularly good ideas or suggested any new tools, he carefully looked into their suggestions and followed them, if possible.

Our editor was surprised to see the various little devices which the garage men had made for doing various kinds of work, and he felt that if every garage in the country had as many and ingenious devices for saving time, there would be fewer dissatisfied customers.

Why is it not possible for us to form an Idea Exchange Society? Suppose you, Mr. Reader, sent us in one of your ideas about some handy tool or device which you have found to be of use around your automobile or garage. In exchange for your idea, you will receive, through the columns of our magazine, an idea from someone else. Your idea has helped you greatly, perhaps, and you will receive much benefit from the idea which you receive in exchange. The best part of the transaction will be that you will only furnish one idea, but in return you will receive many thousand, providing all of our readers feel the same way that you do. Don't you think that this will be a fairly good bargain?

GASOLINE VS. PATRIOTISM.

A few days ago, at the height of the Liberty Loan campaign, a delivery car stopped in front of our office. The car was well plastered with Liberty Bond posters and we had a feeling that we could put our hands on one patriotic merchant, without reaching very far. The driver left the machine, and as time went on, our feeling toward the merchant gradually changed.

When the driver resumed his seat in the machine fifteen minutes later, we had a feeling that we knew of at least one merchant who was doing his bit in helping Germany.

Perhaps you wonder what caused the change in our feelings. Let us tell you. During the fifteen minutes' stay in the building the driver had left the engine running. A small matter, perhaps, but every gallon of gasoline wasted over here means one gallon less for our allies in France. Are you doing your part toward cutting down useless waste? If you are not, you are helping the Kaiser.

Water Vapor In Engine

The Introduction of Water Vapor in the Cylinders Said to Be a Cure For the Carbon Evil

In both the March and the April issues of this magazine we considered various phases of the heavy fuel problem and its relation to the gasoline engine of today. In this article we will explain, in more detail, one of the statements published in a former article relative to the introduction of moisture with the fuel into the engine.

Most engineers have agreed that water vapor is a partial solution of the heavy fuel problem, but a larger number of them have agreed that an engine seems to operate better when moisture is present with fuel. An extensive number of experiments have been conducted with the idea of proving that water is a carbon remover or carbon eliminator. These experiments intended to show that when steam came in contact with carbon, which had been deposited on iron surface, the carbon had a tendency to curl and break away from the surface. For this reason they have conceded that if water is properly vaporized and introduced into the cylinders, it removes at least a portion of the carbon, if not all.

Moisture Helps Engine.

Every motorist knows that his engine gives better results on a damp or foggy day, and he also knows that better results are obtained in a fog than in a rainstorm. Taking all of these facts into consideration, it would seem that water could be used very advantageously in the average engine, and to get the proper results, the water should be in the form of superheated steam or finely divided vapor.

In Figure 1 there is shown two types of water vapor devices which may be made by the average automobilist who is handy with a pair of shears and a soldering iron. At A is shown an ordinary tin

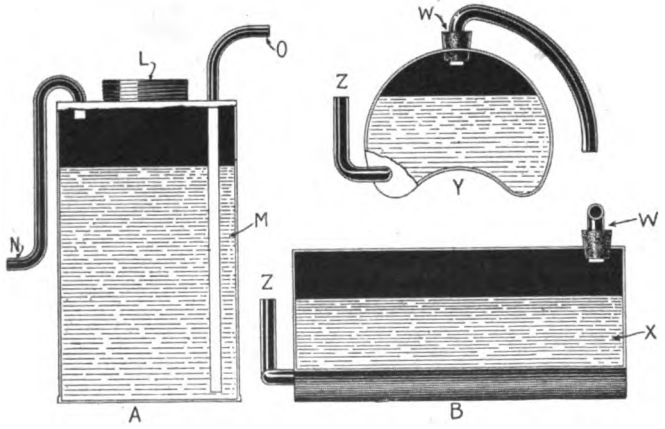

Fig. 1.—Two Easily Made Water Vapor Devices for the Engine.

can which is provided with a screw filler cap L and two brass tubes about ⅛ inch in size. The tube L should be soldered into the top of the box, but should not extend into the chamber M. The tube O should extend nearly to the bottom of the chamber and is open to the air. N is connected with the intake manifold or the carburetor between the throttle valve and the mixing chamber of the carburetor.

The can may be located at any convenient point, the nearer to the engine the better, because the water contained in M should be kept at as high a temperature as possible. The water level in the reservoir should not extend more than three-quarters of the distance from the bottom to the top of the can, else there will be danger of pure water entering through the tube N to the engine.

A Second Device.

A device of a similar style, but not constructed so easily, is shown at B. For making this, a length of stove pipe about four inches in diameter should be used. The stove pipe should be bent, as shown in the end view at Y, to conform with the shape of the top of the exhaust manifold and fitted with two ends. After it has been bent, a hole should be bored very near the bottom and a tube soldered in, as shown at Z. The top of this tube should be at least one inch below the tube of the reservoir and serves to prevent the water level from rising too high in the chamber.

Soldered upon the extreme top is a spout about one inch in diameter, W, which is fitted with a cork and an outlet tube which is connected with the intake manifold at the same point as directed in the first case. This device is clamped to the top of the exhaust manifold, and the heat generated by the combustion is imparted to the water, which is vaporized to a certain extent. Water may be used in either one of these devices, and the results will be very satisfactory. A device of this sort is practical because of the fact that carbon remover may be placed in the reservoir in place of the water, when it is necessary to remove carbon deposits in the engine.

It is not always desirable or practical to install an extra reservoir for carrying water on the engine, and so we give in Figure 2 two methods whereby one may connect the cooling system of the engine with the intake manifold. At A is shown a simple arrangement which can be installed in a very few minutes. The engine water jacket is tapped to receive ⅛-inch pipe fitting at O, and connected with the ⅛-inch pipe fitting is a long copper tube which is wound around and around the exhaust manifold, as shown at N.

The other end of this tube should be connected with a valve M, which is screwed into the intake manifold. At any time the valve M may be opened or closed to admit more or less water into the engine. A slightly more complicated arrangement is shown at B in the same figure. In this case the copper tube is tapped into the water jacket, as shown at P, from whence it is carried through the exhaust manifold, down its length, and out again at R; then connected with the intake manifold through the same type of fitting as at M.

At the points where the copper tube enters and leaves the manifold a stuffing box should be provided, as shown at S, else the exhaust gas will leak out past the tube. The big objection to the two

Digitized by Google

latter types of water vapor devices is that the water used is from the radiating system, and, therefore, the system requires slightly more water than ordinarily.

There are a number of devices now on the market

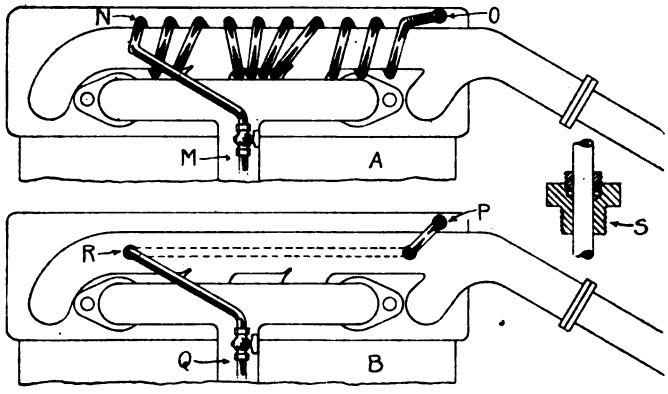

Fig. 2.—Two Methods Often Used for Heating Water Before Introducing It Into the Manifold.

for accomplishing the same purpose, should the automobile owner not care to construct one himself.

Don't trim a friend while trying to give the impression you are doing him a favor.

EFFECTIVE GEAR RATIOS FOR FORD CARS.

The Adaption of the Ford Car for Special Work and in Various Parts of the Country Is an Item for Serious Consideration.

The subject of Gear Reduction, to the owner of a Ford car, is undoubtedly interesting, when one considers the fact that there are more than two million Ford cars used today—some of them for racing—many as runabouts—a large number for touring cars and thousands for delivery and trucking purposes.

This sturdy little car was originally designed for pleasure purposes, but, owing to its great popularity and efficiency, it has been converted into trucks, tractors, etc., and has been used for almost every purpose to which a motor vehicle can be adapted.

About five or six years ago, when the high-speed engines first came into use for passenger cars, the automobile engineers began to experiment with lower gear ratios. Up to this time the original passenger car had been equipped with a three-speed transmission and in some cases a four-speed transmission with driving gears from 3:1 to 3½:1 and sometimes 4:1 ratios. This reduction in gear ratio was found necessary in order to effectively apply the power of the high-speed engine. The developments since that time have thoroughly demonstrated that with a high-speed engine it is necessary to have at least a 4 to 1 or lower gear reduction where more than ordinary service is required.

The Ford car is equipped with a two-speed transmission and a gear ratio of 3.63 to 1, and in heavy going and where the car is used for trucking and delivery purposes this ratio does not permit the proper application of the power.

Efficient Engine Speed.

The engine in a Ford car may be run at 2,000 r. p. m. or 200 r. p. m., but it is not always efficient at either of these speeds. When running on low speed the individual stroke of the engine does not convey a uniform flow of power to overcome the inertia of the weight of the car, which is the reason why it slows down when in high gear running up a steep hill, yet a car will leap forward when in low gear and the motor is allowed to develop more power because of the greater number of strokes in a given time. Neither is the engine of a Ford car efficient at 2,000 r. p. m. for the reason that the power is wasted in vibration and the valves do not allow full charges of gas to enter the cylinders. Just as men can walk most effectively at about five miles per hour, the Ford engine will run smoothest and most efficiently at about 1,000 r. p. m., which corresponds to a car speed of twenty-five miles per hour in high gear or ten miles per hour in low gear. Therefore, to climb steep hills on high gear it is necessary to keep the car speed at about twenty to twenty-five miles an hour with the regular Ford gear ratio of 3.63 to 1.

The Standard gear ratio has been designed to cover the average requirements of Ford cars all over the world. It is just about right for the Ford touring cars in those parts of the country that are not too hilly, and it is correct for the Ford runabout in hilly country, and it handles the Ford sedan very nicely in flat country.

However, the low gear of the Ford car is only adapted for emergency use, temporarily with the low-speed pedal on a long hill. The noise is terrific when starting on steep hills or when in heavy traffic, and it is very tiring for the driver to hold the car in low gear and decidedly unpleasant for the passengers. The gear ratio in the rear axle should be such that it will take practically everything in the territory in which it is generally used, on high gear.

Ratios on Other Cars.

Take two other cars for illustration: the Overland has a gear ratio of 4 to 1 with a four-speed transmission, and the Packard 4.35 to 1 with a four-speed transmission, as compared with the 3.63 to 1 of the Ford with a two-speed transmission.

There has been developed a special gear ratio for the Ford car which is interchangeable with the standard gears in the rear axle and which consists of a ring gear having forty-two teeth and a pinion having ten teeth. The reduction afforded by these gears is the lowest which has been developed to date, and they add approximately 20 per cent. to the power of the Ford car.

In changing the gear ratio of the rear axle, it is necessary to change both the pinion and the bevel or ring gear, known as No. 2518. It is not possible to use a ten-tooth pinion with the standard ring gear, nor is it possible to use the standard pinion with a forty-two-tooth ring gear, because the teeth of the smaller pinion will not fit the teeth of the standard ring gear, nor will the standard pinion fit the teeth of the forty-two-tooth ring gear, owing to the fact that the teeth of both the ring and pinion gears must be made to match in pitch, angle, etc.

Special Gear Ratios.

The Ford car gives the best results in many cases when fitted to the requirements of the locality in which it is driven and for the body and load which it carries. Special ratio gear (bevel and pinion

Digitized by Google

gears) for the rear axle of Ford cars are now being made in the following sizes:

2¾ to 1 Racing chassis—board track.

3 to 1 Racing chassis—dirt track.

3.63 to 1 Standard ratio for runabouts in hilly country, touring cars in rolling country and sedans in level country.

4 to 1 Special ratio for touring cars in hilly country and sedans in comparatively level country.

4.2 to 1 Special reduction ratio for delivery cars in all places, touring cars in hilly or muddy country; sedans in hilly, rough or muddy country, and all heavy commercial purposes.

All mechanics who have repaired Ford rear axles are familiar with the light roller bearing which is used on the propeller drive shaft and which holds the pinion or No. 2597-B in position against the ring gear of No. 2518. When the car is overloaded for standard gear reduction, its jumping and bucking (caused from the propeller shaft whipping up and down) gradually wears this light bearing and allows the pinion to separate and become unmeshed from the ring gear, and before very long the owner has to tear down the rear axle and put in a new drive pinion and sometimes a new ring gear, due to the fact that the gear ratio was improperly adapted for the purpose for which the car was used.

Therefore, it is apparent that a gear reduction of 4.2 to 1 with forty-two teeth in the ring gear and ten teeth in the pinion permits of sufficient additional leverage to make the strains on the propeller shaft and the bearing back of the drive pinion so much less that these parts will wear very much longer and will be less expensive to keep in repair. In addition to this, of course, the gear will perform much better service and pull heavier loads on high gear than if equipped with the ordinary standard gear reduction.

The A B C of the Storage Battery

2—Points To Observe in the Care and Maintenance, Two Factors Which Make For Long Battery Life and Satisfactory Operation

BY A. P. PALMER, E. E.

The average car owner does not realize that the storage battery is a part of his automobile, and an extremely important part at that. The battery should be cared for just as carefully as the engine; in fact, to keep it in condition it should be given even more attention than the engine itself. There are a number of rules which must be observed, and if the owner follows them, the life of the battery will be prolonged.

Seven Rules to Follow.

1. Never use a battery in a leaking condition or turn it out of the vertical position.
2. Add nothing but distilled water to the cells, and do it often enough to keep the plates covered about ¼ inch. Never fill the cells full.
3. Take frequent hydrometer readings to keep specific gravity between 1.275 and 1.300.
4. Give the battery a special charge whenever the hydrometer readings show it to be necessary.
5. Keep the filling plugs and connections tight and the battery clean.
6. Never allow the battery to become heated, in service, to above 110° Fahr. If the temperature reaches 100° burn all the lamps on the car while driving.
7. Never allow the battery to be subjected to low temperature while in a discharged condition.

Battery Installation.

A storage battery on an automobile should be so installed as to be in an accessible position, be protected from the dust and dirt of the road and be so held as to be easily removable. It should have free air space on all sides and be held in place by the handles rather than by resting on the bottom. If any of the cells are in a leaky condition they should be replaced at once, as the electrolyte will soon disappear and possibly cause damage to the car. Do not permit an open flame near the battery. The electrolyte in a cell consists of a mixture of sulphuric acid and water. Sulphuric acid does not evaporate, water does.

When the level of the electrolyte in a cell becomes low, it is due, under normal conditions, to the evaporation of water which should be replaced with distilled water only. If acid of any kind or alcohol is added, it will cause serious injury to the plates.

The battery should be examined every week when in use by removing the filling plugs and adding pure distilled water by means of a hydrometer syringe till the level is about ¼ of an inch above the top of the plates. Then replace the filling plugs tightly to prevent the slopping of acid. If electrolyte has been spilled from the battery, by accident, the loss may be replaced with electrolyte, the same specific gravity as that of the other cells.

In order to determine whether a battery requires charging or not, the electrolyte is tested by means of a hydrometer syringe. This should not be done after distilled water has been added. The electrolyte is sucked up into the syringe containing the hydrometer and the latter is read. A reading of 1.250 to 1.275 indicates that the cells are properly charged. From 1.250 down to 1.200 indicates a half charged condition. From 1.200 to 1.150 shows battery is less than half charged. Below this indicates battery completely discharged. After testing return the electrolyte to the cell from which it was drawn.

An exhausted battery should be re-charged at once.

Finding a Faulty Cell.

As the cells of a battery are connected in series, when they are charged, the same current passes through each, so that if one cell should have a lower reading than the rest, and this difference should increase from week to week, there is something the matter with the cell.

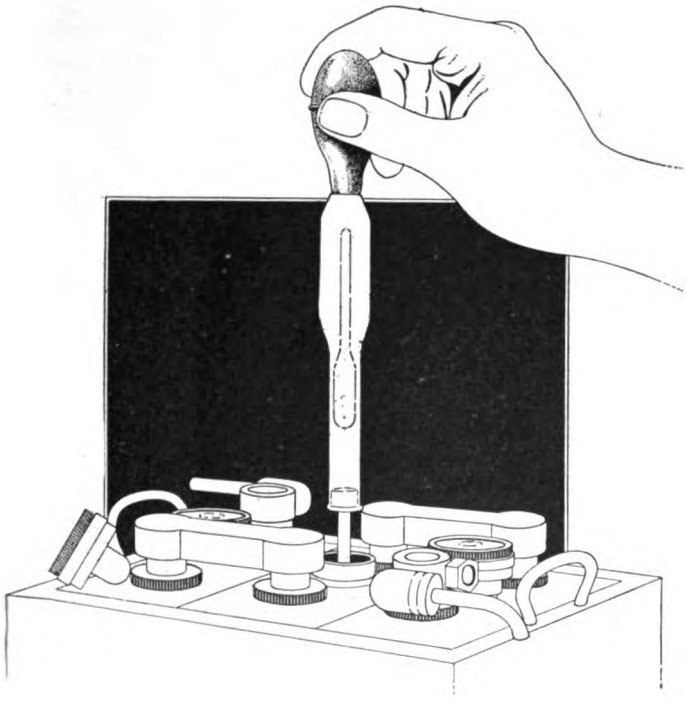
The trouble may be caused by a short circuit

Digitized by Google

which may, if neglected, cause serious damage to the battery and requires the prompt attention of a good battery repair man.

If one cell regularly requires more water than the others, a leaky jar is indicated. A leak will cause the electrolyte to escape, and the addition of water will lower the specific gravity.

Any repairs necessitating taking the cells apart should not be attempted by the individual owner, but should be done by a competent repair man.



It is often the case, where a car is started and stopped a good deal, that the discharge rate is greater than the charge, so that the battery becomes exhausted. In this case it is necessary to remove it from the car and give it a separate charge.

If, during a tour, very little night driving is done, the battery will be charging continuously with but little or no current used for starting or lights. Under such circumstances the battery is likely to be overheated and ruined unless it is given special attention. If the lead connections on the top of the battery feel more than blood warm to the touch, take the temperature with a dairy thermometer. If over 100° is indicated, burn all the lamps while driving. If 120° is shown, the battery may be ruined.

Cold also has a bad effect upon a storage battery. At 10° Fahr. the available battery capacity may be reduced 50 per cent. and the voltage is also reduced. There is no danger of the electrolyte freezing in a fully charged cell. But in one which is over-discharged or has had water added without subsequent charging, this is likely to occur in cold weather. Cleanliness is essential to obtain the best results. The connections should be kept clean and dry.

Charging Connections.

In order to charge a battery the connections should be made as shown in Figure 2. Six lamps, each 110 volt, 100 watt, are connected in parallel

Taking the Specific Gravity of a Cell With an Hydrometer.

on a board, and this board is placed in series with an ammeter of at least 10 amperes' capacity, and the battery to be charged. This combination is then connected across a 110 volt direct current line, the negative terminals of battery and line being connected.

By unscrewing each lamp, which takes about an ampere, the current passing through the battery

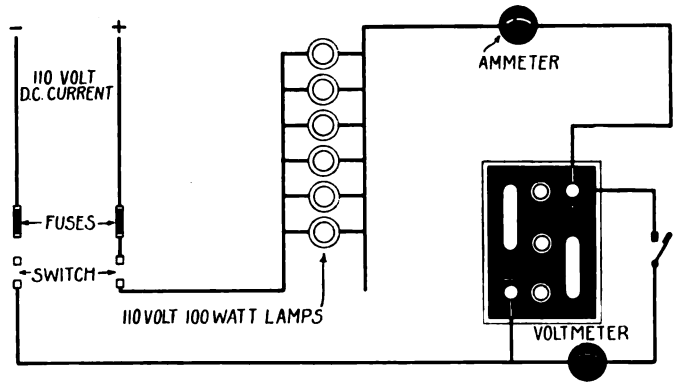


Diagram of Connections for Charging Storage Battery.

may be varied to suit the size battery.

If the battery is to be charged from a 220 volt circuit, two lamps may be used in series in place of one, as in the 110 volt system.

Never use alternating current with this system, and make sure that the level of the electrolyte is correct and the filling plugs are tightly in place before charging.

Adjust the number of lamps in circuit till the proper charging current is obtained, as shown on the instruction plate, and charge till a maximum specific gravity has been obtained for one hour and the cells are gassing freely.

Near the end of the charge remove the filling plugs to make sure that the cells are all gassing freely. Be careful to quickly replace and tighten the plugs or flooding will result. The time required ordinarily is about twenty-four hours if the battery is completely discharged. The specific gravity of the charged solution should be between 1.275 and 1.300, and the voltage about 2.1 per cell.

STORAGE BATTERY BOOK.

We acknowledge receipt of an Automobile Storage Battery book from the American Bureau of Engineering, Inc., 1018 So. Wabash Avenue, Chicago, Ill. This book should be in the hands of every person who has anything to do in the care and repair of storage batteries. The book has 284 pages, is copiously illustrated, and gives practically all of the information necessary for charging, maintaining and repairing storage batteries. Practically every phase of the battery field is taken up in detail, in a simple manner, so that it may be understood by any mechanic.

We can strongly recommend this book to our readers, and should any of them desire a copy they should write to the American Bureau of Engineering for price and other details.

Have you any definite plan for the regular saving of money, or do you just put aside a little when it is convenient? That is a mighty poor plan, for it is so seldom convenient! Just plan that you owe your savings bank so much at the first of every month, and make up your mind to pay the bill. You'll be glad some day if you do.

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.
The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusabe accident of a collision at a railway crossing.

Carelessness at a Crossing.—Because a driver chose to ignore all traffic rules and drive at top speed across an intersecting road, a three-year-old girl was badly injured and died later. The child was crossing the street, when the automobile, driven at top speed, turned and ran directly over the girl. The accident happened in Washington, and a short time later the driver collided with an electric car outside the city.

Trebling the Speed Limit.—One man was killed and three badly injured at Akron, Ohio, when the car in which they were riding, at about 90 miles per hour, collided with another machine and ran into a ditch. The speeding machine was on a straight road, overtook the second car, ran into one wheel and was thrown to one side into the ditch by the shock of the collision. The occupant of the second car escaped with a few minor injuries.

Ignoring Road Rules.—Physicians offer no hope for the recovery of an aged man of Little Rock, Arkansas, who was run down and seriously injured by an automobile, driven by a woman. The accident occurred at the corner of a street, and, according to by-standers, the machine was being driven on the left side of the road.

Driving on Sidewalk.—Two young men were badly injured, one seriously, at Athens, Ga., when a Ford car, driven by a chauffeur who chose to cut across the sidewalk, ran them down. Witnesses stated that the car was operated on the left side of the street, and that just before it reached the corner of an intersecting street, it was driven onto the sidewalk and over the two pedestrians. The chauffeur offered no excuses, and the steering gear seemed to be in good condition.

Excessive Speeding.—One man was killed and seven badly injured in Philadelphia early this month. A touring car, driven by a party of "joy riders" was hit and cut nearly in two by a heavy mail truck. Evidences point to the fact that both machines were being operated at an excessive rate of speed, and as an example of the effect of impact, a magneto from one of the machines was wrenched loose by the collision and thrown high into the air, through a plate glass window in a store nearby.

Rain Obscures Vision.—Bearing out one of the instances given in our first story, is an accident which recently happened on Long Island. An automobile, driven at high speed, crashed through the gates of a crossing, and the occupants were saved only by the quick action of the driver, who swerved the car to one side in a direction parallel with the tracks. The front wheels of the machine passed over the edge of an embankment, and the car hung by the rear. All of the occupants escaped by jumping from the machine. The driver claims that moisture on the windshield prevented him from seeing the crossing gates.

Rear End Collision.—What seemed to be a case of foolhardy carelessness was shown in a rear end collision in Peoria, Illinois, a short time ago. A car was being driven at a moderate rate of speed along a straight road when another machine, operated at 45 or 50 miles an hour, came speeding down and drove head-on into the rear of the former machine. The driver of the second car claimed that he was giving the automobile a try-out and didn't realize that he could not control it.

Aged Pedestrian Killed.—A well-known "horse" man was killed recently by a careless driver, who escaped without punishment. The victim was walking on a footpath near the city of Washington. D. C., when an automobile operated at a high rate of speed rounded the corner, "slewed" off the road and over the man. The machine was occupied by two men and a woman, and did not slow down, though their actions plainly indicated that they all knew of the accident.

Physician's Auto Hits Two.—A prominent New York physician was fined $25 in the Williamsburg Magistrate's Court last month on a charge of reckless driving. It was charged that he struck a wagon, in Brooklyn, and knocked the driver from the seat, but did not stop. A few blocks farther on, it is alleged, his car struck another automobile, standing at the curb, but he made no attempt to stop in this case.

Speeding Car Turns Turtle.—A Ford car, driven at a fast rate of speed, in Lima, Ohio, struck a hole in the road and turned turtle. The two occupants were thrown out and sustained many injuries. The rolling car pinned the two victims to the ground, and they were extricated only after considerable effort.

Run Down by Bus.—Because a citizen of Baltimore joined the "Jay Walkers" class, he is repenting at leisure in the hospital. The victim, who did not notice the approaching machine, stepped directly into its path and was knocked unconscious. The driver of the bus picked him up and carried him to the hospital. A patrolman, who witnessed the accident, absolved the operator from all blame.

Skidded While Speeding.—One man was killed and another badly injured in Philadelphia, two weeks ago, because the driver was reckless. Witnesses state that the car was being operated at a terrific rate of speed and that it was not slowed down to make a turn. As it came to the bend in the road, it skidded on the slippery pavement and crashed into a telegraph pole; it then caromed off and into a second pole. After this second impact it overturned, and the occupants were pinned beneath it.

Motor Trucks in War and Commercial Service.

Requirements of Military Trucks As Learned From Operation On the Mexican Border and In France

BY G. W. SMITH *

The subject of military trucks has been more or less divided in discussion into two general groups dealing with operation on the Mexican Border and with operation in the war area of France. A summary, representing what may be called an average opinion of the truck engineering profession, is given below.

Changes desirable for service similar to punitive expedition in Mexico:

1. Great increase in cooling area of radiators, probably 50 to 75 per cent.
2. An increase in low-gear ability by increasing total gear ratio. This positively indicates a four-speed transmission with a low-gear ratio of not over 20 per cent.
3. An increase in high-gear ability by means of an increase in piston displacement. This value varies from 33 to 37 pounds gross weight per cubic inch of piston displacement.

In addition to the requirements as given above it is necessary to design the suspension of the various units with the greatest care in order that distortions cannot cramp or bind the various joints and moving connections. Many details of design need improvement and particular attention must be given to the lubrication of the various bearing points.

Changes Desirable for European Service.

For service similar to that of the Allied armies in France the following is indicated:

1. Improved design of detail and greater refinement in workmanship, particularly with reference to American trucks.
2. Somewhat more liberal dimensions of the various parts.
3. Increased radiation in some cases.
4. Better design of engines, incorporating such features as full force lubrication, improved carburetion, more liberal bearings, crankshafts, etc.
5. Improvements in the design of clutch and transmission units to facilitate repair and preserve the alignment of the various parts.

The foregoing covers, of course, the deficiencies of commercial trucks and does not sum up their virtues.

The manufacturer of motor trucks has to contend with some very adverse conditions in comparison with other industries. The buyer in most instances is a good business man, but does not have the experience or training to properly judge the merits of the machine offered. In fact, a considerable part of the merchandising end of the motor-truck industry is deficient in the elements that make for satisfaction to the buyer and seller.

The requirements of the Mexican service were extraordinary. The railroads, which should have carried the supplies, were in the hands of the "de facto" Mexican government, and, for reasons best known to our government, were not available for our service. This meant that trucks would of necessity be used where there were no roads and not a single favorable condition.

It is hardly conceivable that such a situation could arise. The conditions were neither those of peace or war, either one of which would have made it unnecessary to use trucks as they were employed. In case of war, railroads would have been seized and supply trucks could have operated from bases to supply points chosen with much more freedom and care as to road conditions. In case of peace, trucks could not hope to compete with railroads for the distances that were involved unless suitable roads were provided.

Adverse Conditions on the Mexican Border.

As to the maintenance of the trucks it is absurd to expect to provide anything that will show a reasonable operating cost under the conditions met with. The entire truck from tail lamp to front bumper was covered with a fine grit of first-class abrasive properties to a depth varying from one-eighth of an inch to one-half inch. Any joint sufficiently close to keep out this abrasive material would be entirely too close for lubrication requirements. The average truck stood up well considering that it was not intended to perform the service to which it was applied.

Another thing which should be considered is the personnel of the operators on the Mexican border. No criticism of the United States Army is intended, as the American people themselves and not their army officers are responsible for the condition of unpreparedness which arose at that time. It can be stated as a general proposition that the average truck driver was considerably under the desirable standard. Even the men sent from the factories were not above reproach, as many of them were hastily chosen and had little actual experience.

As a result, with few exceptions no attempt was made to operate trucks at governed speeds. This statement must be modified somewhat on account of the governor mechanism going wrong owing to deficiencies in design. In the main, the general statement is true.

Another difficulty was the absence of any suitable place to make repairs. Not until nearly the end of the expedition were proper conditions obtained. It was quite common for repairs to be made on the engine and other units of the trucks amid a perfect cloud of sand and fine dust.

Ordnance Organization.

These conditions were observed by the officers of our army, and we are happy to say that they will never again be duplicated. It would be difficult to accurately appraise the various operating organizations which have been brought into existence since the declaration of war. The work of the Ordnance Department is better known to the author than that

Digitized by Google

of other departments, so his remarks will be confined thereto.

Many men have been chosen as commissioned officers to have charge of the operation of the motor equipment. These men have been selected with reference to their technical knowledge and familiarity with motor vehicles. It is safe to say that they rank as near 100 per cent. as is humanly possible. Schools are established at many points and the various vehicles are being studied from all points of view. It can be taken as a foregone conclusion that we will be proud of these men when they get over there and demonstrate the real ability that is in them.

Truck Drivers.

It has been stated that the drivers of trucks will be chosen from the National Army and possibly recruited by volunteers. No accurate information seems to be available at this time. It is earnestly hoped, however, that the selection of these men will be carefully considered. As a general rule few men who have driven passenger cars are suitable as first-class truck drivers. The truck driver should be strong, although not necessarily large, and should be possessed of sufficient judgment to recognize when trucks may be operated at full speed advantageously and when to slow down for rough going or over a chuck hole in the road which will jar the truck from end to end unless negotiated with care. Some of the best drivers in the commercial truck field are men who have been teamsters, and have been retained to operate the new trucks when they have superseded the horse-drawn vehicles. The operators should also be required to inspect and lubricate the vehicles as frequently as operating conditions will allow. Once daily, for many of the units, is none too often when it is considered that labor will be plentiful. Any reasonable attention will certainly be repaid many fold.

Large Pneumatic Tires.

An important recent development is the use of large pneumatic tires in sizes as large as 10-inch section, and it is stated that sections of 15 inches are commercially possible. The use of pneumatic tires does not mean simply putting them on existing chassis, but will demand larger engines and higher gear ratios to keep the engine speed at a normal value. It will also be possible to reduce the dead weight ratio to the pay load and greatly increase the efficiency of operation.

The heavy-duty low-speed truck may also extend the operating limits of trucks to territories now considered impossible. Road conditions involving deep mud and sand, where the tractive resistance may be around 500 pounds to the ton, may be dealt with successfully. On the other hand, it is extremely doubtful if sufficient power can be utilized by a rear-drive vehicle to pay for the greatly increased cost of construction and operation that of necessity goes with more power. The maintenance problem is by no means solved, as it must be remembered that any increase in torque must be taken care of by a corresponding increase in all the driving and supporting mechanism. The more powerful the vehicle, the more ability it has to destroy itself. Only a few years ago the automobile had arrived at a state of development where it would operate with fair satisfaction and economy. Immediately there arose a demand for more power. The power was accordingly forthcoming, and almost immediately the cry went up that the power was all right but the chassis was inadequate. The next year the chassis was strengthened, with an increase in weight and a decrease in power. This alternate change continued until the advent of the multi-cylinder engine, when the pressure was somewhat relieved. The simile between past history and the subject under consideration is possibly greater than is generally appreciated.

Possibly the most satisfactory application of the increase in power is to drive on all four wheels. This can be accomplished with a relatively small increase in weight and increases the ability of the vehicle to an extent that eclipses anything that can be hoped for in two-wheel driven vehicles. The effect is greatly augmented by the use of some form of friction differential. There is no question that the conventional truck can use a large amount of power when operated on dry, hard roads, but when sand roads and mud are to be negotiated the increased power is of little use, as the wheels easily embed themselves and lack ability to drive the front wheels forward or even to get themselves out of the hole.

As time goes on road conditions improve, grades are reduced and it becomes constantly more profitable to operate trucks. It is possible that some kind of finality may be achieved in the design of trucks. Until such time standardization should be undertaken with extreme caution. Any general standardization should be undertaken only as an extreme military necessity and not as a proposition likely to do good to the industry.

This remark does not apply to the various matters of detail such as spark-plugs, magneto bases, screw and bolt sizes, or even to the question of standardizing such things as wheel gauges. The last subject mentioned should be handled rather gingerly, perhaps, in view of the inconvenience caused by the standard gauge of railroads. It is general knowledge that the 56½-inch gauge was adopted as an inheritance from horse wagon practice in the swaddling days of the railroads. Endless inconvenience in the design of locomotives and cars by reason of the limitations of space between wheels is now the lot of the locomotive builder.

In summing up it would appear wrong to hastily discard any of the well-balanced vehicles now being furnished to commerce and substitute a new and comparatively untried combination of weight ratio to load and power. The only hope of advantage for such change would be an extremely doubtful chance of securing greater durability.

Economy With Good Roads.

Economy in transportation seems to lie in a very different direction. Good roads are coming almost automatically, and with them will come higher speeds. This brings us to the pneumatic tire. With the pneumatic tire will come larger ground contact and more "buoyancy," if the term can be permitted. This so-called buoyancy will make it possible to negotiate soft going without sinking in so deeply as with narrow solid tires. The average truck operates less than 10 per cent. of its total working time on bad road conditions, hence the latter design would offer more likelihood of success.

The development of the future truck must be the result of a natural evolution and not an arbitrary selection by a limited number of engineers with no positive knowledge of future events.

Dealing With the Material For Wheels

Sources of Supply From Which Wood May Be Taken For Automobile Wheels Seems To Be Almost Unlimited

"There has never been, nor will there ever be, a scarcity of good wood for the making of wheels for motor vehicles," is the statement made by S. Vance Lovenstein, president of the Schwarz Wheel Co.

Very recently there has been considerable agitation among those in the automobile manufacturing circles because of the rumor that the available lumber for making wood wheels was being exhausted, and that with the decreasing supply, the wheel manufacturers would be inclined to substitute inferior woods. This apprehension, however, seems to be entirely without foundation upon facts.

Wood wheels used today upon passenger automobiles are made exclusively of hickory, because this wood has the greatest strength and resilience per unit of weight. A passenger car wheel must be made to withstand considerable strain, for such a machine is used very severely as far as traffic is concerned. Frequently it is driven at full speed around corners, it is forced over curbs, and it is pounded over rough roads at high speeds. The strain must be taken, necessarily by the wheels and great resilience is necessary.

This is the first property required, but strength is also a requisite factor. Every ounce of wood added to the wheel, however, means so much more unsprung weight, and so lightness must be considered. Therefore we have the reason for hickory in the construction of these units.

The wheels used on trucks are made principally from hickory, but in this case, weight does not play such an important part and we find many truck wheels made from other strong woods, such as white ash, white oak, hard maple, northern and Canadian birch, and rock elm.

These other woods have proved to be entirely satisfactory for truck wheels because of the fact that as the weight of the spokes and felloes is increased, the difference in strength and resiliency between hickory and the other named woods becomes less.

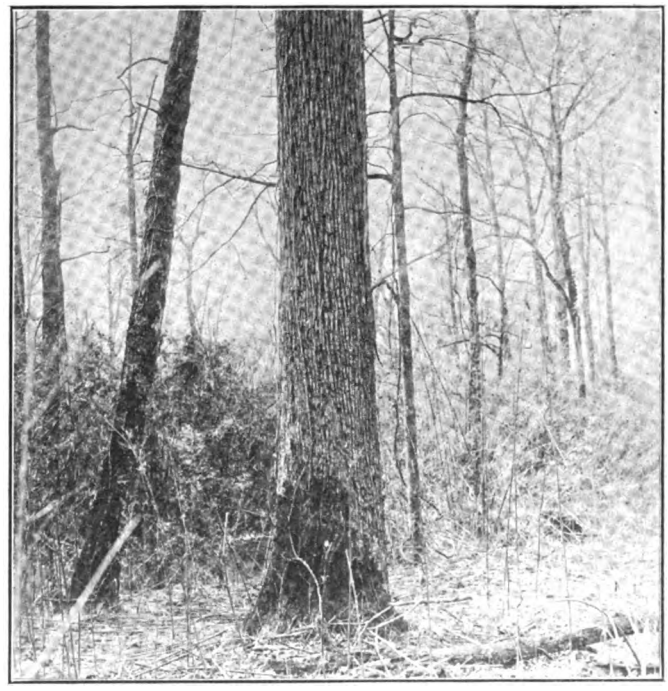
The use of all these varieties of hardwoods for wheel making is not new. They have been used for centuries and have proved themselves to be the woods best suited to the purpose.

Standing Hardwood Timber.

At the present time there are practically three hundred billion board feet of wheel-making timber standing uncut in our American forests, according to recent estimates, and of this amount nineteen billion board feet are hickory.

Approximately one hundred million feet, of all kinds of timber, are used annually for the making of wood wheels, and if the figures above given are correct, there should be no doubt in our minds that the available supply will last for many years to come, or until more trees are grown.

Conserving the Supply.



Of course, the varieties of hardwood used for wheel-making are also used for a great many other purposes. Some of these uses are undoubtedly wrong and wasteful and constitute a terrific strain upon the supply of these valuable woods. So much so that it must be the business of lumber producers, lumber manufacturers and governmental bodies to regulate, to a considerable extent, the uses which shall be termed "legitimate" for certain woods—especially hickory and ash.

In the case of hickory, for instance, conservation is already being practiced, although there are still millions of feet of this valuable wood being used where inferior and more abundant varieties would answer the purpose equally well, if not better.

For example, recent investigations made by the United States Forest Service show that more than 44,000,000 feet of hickory are used every year in this country for the smoking of meat products. While twenty-five other varieties of wood are listed as suitable for the purpose, the amount of hickory used is greater than that of all the others combined.

In some parts of Pennsylvania, hickory is used in the coal mines for posts, props, rails, cribs and lagging, while there are at least fifty other varieties of wood at hand, many of them even better suited to these purposes than hickory.

In West Virginia, oil-well derricks are made of hickory, while in certain parts of Missouri and in other regions where hickory is abundant, it is used

A Hickory Giant. Though These Trees Are Seldom Large, This One, in Arkansas, Measures 14½ Feet in Circumference.

for bridges, barn floors and doors, fences, sheathing, piling, culverts, cross-ties, car-stock and similar "wrong purposes."

Valuable Lumber for Firewood.

While accurate figures are unavailable, government experts say that as much good hickory is

Digitized by Google

burned up every year for fuel and in open fireplaces as is used commercially.

All these wasteful uses of hickory, however, are correcting themselves gradually, for it is obvious that the higher value of this wood is making its

Hickory Bolts and Billets Ready for Shipment to Wheel Factories These Billets Are Ready for Immediate Seasoning and Shaping Into Spokes and Felloes.

use extremely expensive in cases where inferior woods can be used.

Even where a farmer has hickory trees upon his own land, it will pay him to sell his hickory and buy other lumber and firewood rather than to utilize the hickory for his own building, repair work or fuel.

In addition to the better regulation of the uses to which hardwoods shall be put, there is also to be considered the extensive forest conservation and cultivation programs now being conducted by the national and state governments.

At the present time more than twenty-five per cent of all the standing timber in the United States is owned by the national and state authorities, and this percentage is being constantly increased. The timber upon these reservations is being cut judiciously, the forests are being protected from fires and cut-over areas are being reforested.

Naturally the beneficial effects of public ownership and control will be felt much more in the future than they are today, although even now the admirable work of the government is being appreciated by the more far-sighted lumbermen and in some cases the government methods are being applied to privately owned forests.

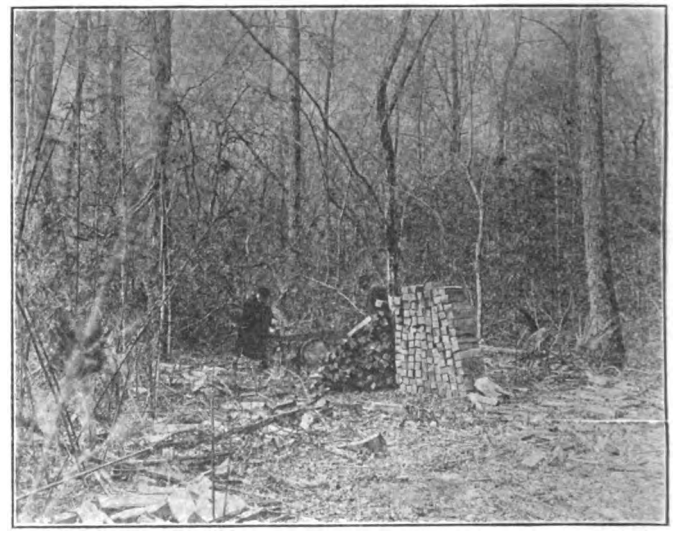
The day of ruthless cutting of hardwood trees and inefficient wasteful utilization of hardwood lumber is about over. The practice does not pay. Lumber interests are waking up to the fact that it is really killing the goose which lays the golden eggs.

The Supply of Hickory.

Hickory—the ideal wood for wheel-making and the wood most generally used today—comes in greatest quantity from Arkansas, Tennessee, West Virginia, Kentucky, Indiana, Ohio, Missouri, Pennsylvania, Louisiana, Mississippi and Alabama. These eleven states produce about nine-tenths of the hickory used in this country the remaining tenth coming from more than a score of other states.

Hickory logs and bolts destined for wheel factories are cut directly into rim-strips and into billets for wheel spokes and felloes. Hickory going to handle factories and to vehicle makers is also cut by the saw mills into dimension sizes, and is therefore not classed as "lumber."

The method of cutting hickory, while originally done at the request of the manufacturers, is indirectly eliminating the waste of much hickory and making its use impracticable for purposes where inferior wood could be used. It is a tremendous step forward in the proper utilization and conservation of this valuable wood.



The Supply of Other Wheel-Making Woods.

The supply of white ash, white oak, rock elm, northern birch and hard maple—the woods used along with hickory for the making of motor truck wheels—is considerably greater even than that of hickory.

According to recent estimates compiled by the United States Forest Service, co-operating with the National Lumber Manufacturers' Association, it is shown that there are about five and a half billion feet of standing hardwoods in this country. In addition to this, we must not overlook the fact that there are vast quantities of good wheel-making wood in Canada; much of it even now being used by American wheel manufacturers.

There are thousands upon thousands more feet of uncut birch timber in Canada than there is in the United States, while other woods appropriate for wheel-making are being produced by our neighbor to the north in steadily increasing quantity every year.

So that, all things considered, the question of a

Cutting Hickory Logs Directly Into Billets for the Wheel-Making Industry. A Method Which Saves Time and Transportation on Waste Material.

possible scarcity of the woods suitable for wheels—not to mention the exhaustion of the supply—is one which should occasion no concern in the minds of automobile manufacturers or users of motor vehicles.

If you have an ambitious employee, subscribe for an Automobile Dealer and Repairer to be sent to his home address.

SHIP BUILDING GROWTH.

Our Progress Described by Shipping Board Chairman.

Among the most interesting features of the speech which Edward N. Hurley, Chairman of the United States Shipping Board, delivered before the National Marine League were his statements as to what has been accomplished in the direction of output of vessels. According to Mr. Hurley, there were 37 steel shipyards in America at the time of our entrance into the war. Since then 81 steel and wood yards have been located, while 18 other yards have been expanded.

We are building in the new and expanded steel yards 235 new steel shipways, or 26 more than at present exist in all of the steel shipyards of England. As an evidence of our progress, Mr. Hurley referred to the record made by a Seattle company, which launched an 8,800-ton vessel 64 days after the laying of the keel. This ship was delivered to the Fleet Corporation on January 5 and started on her first voyage on January 14.

An Oakland, Cal., concern, Mr. Hurley said, had launched successfully three 9,400-ton vessels in a single afternoon.

Total Construction on March 1.

The total amount of our steel construction on March 1 was 8,205,708 deadweight tons, made up of 5,160,300 deadweight tons under contract with the Emergency Fleet Corporation and 3,045,408 dead-weight tons of requisitioned vessels.

Approximately 28 per cent. has been completed. In other words, the program for steel ships has advanced 28 per cent. toward completion. Of the amount of steel ships under contract and under requisition approximately 8 per cent. were actually completed on March 1. This amount of floating tonnage exceeds our total output in 1916, including steel, wooden and sailing vessels, by approximately 50 per cent.

Referring to the German ships in American ports which were taken over and found to be crippled by their enemy crews, Mr. Hurley said: "With the expenditure of a little less than $8,000,000 we have succeeded in placing in our war service and in the service of the Allies 112 first-class German and Austrian vessels, representing a carrying capacity of nearly 800,000 deadweight tons."

Development of Ship Yards.

As to the development of our shipyards, the 37 old steel yards now have 195 ways, as against 162 eight months ago. Other parts of their plants have increased proportionately. Thirty new additional steel shipyards are being erected with a total of 203 ship-building ways. Thus we now have in the aggregate 67 steel shipyards either wholly or partly engaged in Fleet Corporation work. These yards will have a total of 398 steel building ways.

Of these yards, 35, with 258 ways, are on the Atlantic and Gulf Coast; 19, with 66 ways, are on the Pacific Coast, and 13, with 74 ways, are on the Great Lakes.

Wooden Ship Facilities.

In addition, the capacity for wooden ship building has been increased until we now have 81 such yards with 332 ways completed or near completion. Mr. Hurley estimates that our output of wooden ships will approximate 2,300,000 deadweight tons annually.

The 332 wooden ship-building ways added to the 398 steel building ways give a total of 730 berths on which to build steel and wooden vessels—an increase of 495 within a few months.

Causes of Delay.

The delays that have occurred in the turning out of ships Mr. Hurley attributed largely to the slowing up of railroad transportation, more especially as the method of producing ships today is one of assembling rather than of constructing all the parts at any one point.

Delay has also arisen because of the unprepared condition of the turbine and engine manufacturers. Here, again, construction has been delayed by lack of transportation facilities. Mr. Hurley said, however, that the Board expects to make up for the shortage.

The first concrete steamship, recently launched, he stated, gave promise of being a success.

As to the number of employees in ship-yards, Mr. Hurley stated that whereas in 1916 there were less than 45,000 men employed in all the shipyards of the country, on March 2, 1918, the number had increased to 236,000, of whom 170,589 were working on actual shipping construction. In addition, the Board has recruited a volunteer force of 250,000 highly skilled mechanics, who have agreed to hold themselves in readiness for a call.

LIBERTY TRUCKS PROVE VALUE OF STANDARDIZATION.

Trucks built of standardized units have proven most satisfactory from the standpoint of construction and sheer efficiency. This fact is recognized by the engineering experts at Washington, who are working with the government and who have designed the various types and sizes of Liberty trucks. Orders have been placed with various truck manufacturers for 10,000 of the Class B Liberty trucks.

The exceptionally able engineers who created the Liberty truck fully realized, out of a long and ripe experience, that in order to design a truck which would withstand the shocks and severe usage incident to war, parts which have proven their durability and reliability by many years of service must be used.

They realized further that if the Liberty truck is to handle its full share of the many burdens placed upon it that it must have parts which are interchangeable, and which can be renewed upon short notice should occasion arise. The tonnage problem of transporting thousands of trucks to France is necessarily a serious one and no more space is to be used than is absolutely necessary.

Since standardized units and repair parts for Liberty trucks are of exactly the same dimensions in every case, it is obvious that far less of the vitally necessary shipping space will be used than would be the case if a few manufacturers supplied the trucks of their own individual design with a consequent far greater variety of parts necessary to keep the separate types in constant repair.

The far-sighted government engineers have kept this fact constantly in mind with the result that

Digitized by Google

the standardized Liberty truck is a triumph of mechanical skill and engineering efficiency. That it will play a vital part in the winning of the war, is a foregone conclusion.

Similarly most of the individual truck manufacturers are building large and successful businesses by building into their product nationally known parts of recognized value. In many cases they would not succeed did they not do so.

Successful manufacturers of trucks appreciate that parts manufacturers, who have devoted many years and vast amounts of money to the perfection of special units, can produce better parts more economically than any one manufacturer who should attempt to build every part of the truck.

It has been fully demonstrated that the trucks which give the longest and most reliable service are those which are built of the best units obtainable.

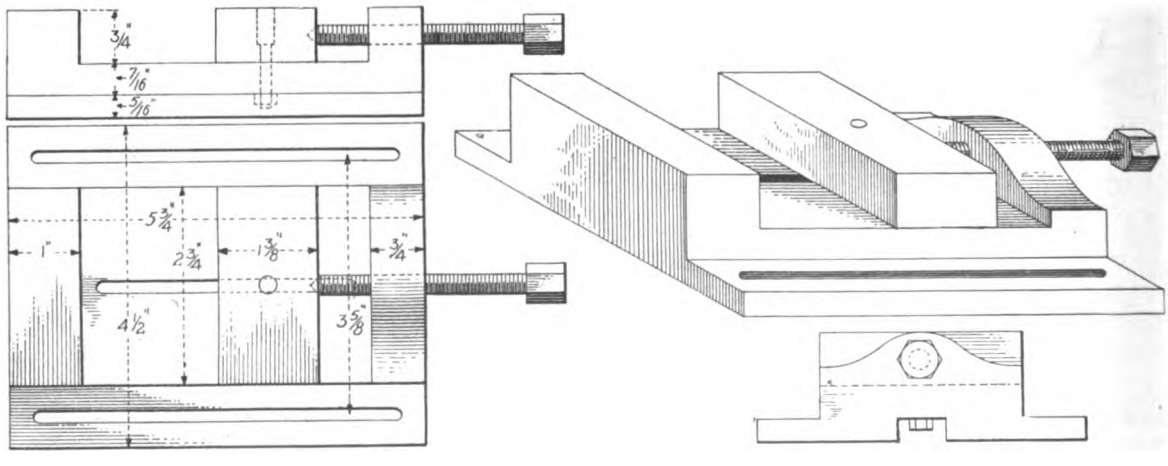
Years of experimentation have proven that men who have designed and built a special part over a period of years know more about that part and are better equipped and trained to produce it than could any organization which attempted to produce all the parts of a truck.

A NEW BRANCH OFFICE.

One of the cities of the United States which has profited greatly by the war is Tacoma, Washington. At this city the port business has increased nearly 300% in the past four years. This great increase is due, both to its natural shipping facilities and its connection with the Far East and Japanese trade. In addition to these great commercial advantages, six huge shipbuilding plants for turning out both wooden and steel ships have been constructed recently.

In order to serve the shipbuilding and allied interests, as well as the constantly increasing number of manufacturing plants, the H. W. Johns-Manville Company have opened a new branch office at 1015 A street, Tacoma, Washington. At this office is carried a complete stock of asbestos packings, molded and in sheet form, and other well-known specialties made by this firm.

Do you realize which one of your habits is the most valuable and is worth the most money to you? If you don't know, set to work and find out, for you will need to take mighty good care of that habit and all the others contributory to it.



MAKING A DRILLING VISE.

The following description dealing with the making of a small drilling vise appears in Work, an English publication. It was made to suit a small Goodel-Pratt drilling machine, which drills up to ⅝-inch, and can be modified to suit the table of any other drilling machine by so arranging that the slots for clamping to the table are exactly above the slots or holes on the table of the machine to which the vise is to be fitted.

Two patterns of the dimensions given, one for the vise and the other for the loose jaw, were made, and all machining was done on the lathe, though, of course, if a planing or shaping machine is available it would be better. After cleaning out the slots with a file, the vise casting was mounted on the lathe faceplate and the underneath turned true; and to facilitate clamping to the face-plate, the pattern can be formed somewhat flat, as shown by the dotted lines. The casting was then reversed on the faceplate, so that the surface on which the loose jaw slides could be faced up as far as possible (the top of the fixed jaw being cleaned up at the same time), and the corners of the surface which could not be reached by the lathe tool were faced up with a file and by scraping, care being taken to keep the surface as true as possible.

The loose jaw was then mounted on the face-plate and one side, the top, and the bottom faced up true, and a hole bored right through the casting from the top to take the bolt. The hole was countersunk some depth to suit the upper part of the bolt, and the top of the latter was cleaned off to the level of the loose jaw. When the loose jaw is fixed on the vise the nut of the bolt is screwed up so that the jaw will slide, space being provided right across the casting to allow room for the nut. The vise casting is drilled and tapped to take the screw for tightening up as shown. It is made of hexagon mild steel and threaded 7/16-inch for 3 inches. The block has a slight countersunk hole drilled where the tightening screw bears against it. The jaws can be shod with cast steel—two old flat files let down to the right temper would answer well—but the vise grips well without.

This vise will be found to be most useful in drilling small or round work, and the way it is made, with the loose jaw free to swivel to a certain extent, makes it a useful tool for holding irregular or wedge-shape pieces.

Side, Plan and End View of Small Drilling Vise.

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

Mixing Electrolyte.

2425

From Jas. Bond, Kentucky.—Will you kindly tell me how to mix water and acid for storage batteries, and how much acid to use? Is there any danger in charging a storage battery?

Reply.—In this issue of the Automobile Dealer and Repairer is started a story which will take up in detail the construction, operation, and care of the storage battery. It will be written in such a way that no one will have any trouble in understanding it, and we should advise you to read the articles very carefully.

Under ordinary conditions, the storage battery should require the addition of no electrolyte or acid, simply distilled water. When a battery is fully discharged a certain part of the sulphuric acid, termed sulphate radical, separates from the mixture and combines with the lead plates causing the specific gravity of the solution to fall. When in the discharged condition the electrolyte is nearly all water. As the battery receives a charge, the sulphate radical is driven off and combines with the mixture causing the specific gravity to rise. From this then, you can see that the amount of charge or discharge that the battery has, can be approximately told by the finding of the specific gravity of the electrolyte with the hydrometer. Unless there is a leak in the cell, there should be no reason for the addition of sulphuric acid or electrolyte, and should the electrolyte be added, one should be careful to add the electrolyte of the same specific gravity as that of the electrolyte in the other cells. In other words, the electrolyte in all of the cells of a battery should have the same specific gravity. Electrolyte should be mixed in a glass or porcelain dish. A large volume of water should be placed in the dish and the sulphuric acid added to the water very slowly. Chemical action resulting from the addition of the acid is very great and will cause considerable heat, and so the solution should be allowed to cool before it is put into the battery. Only the purest acid and distilled water should be used. When charging a storage battery there are certain gases that are likely to explode if a lighted match or open fire is brought near to them. This is the only danger that might arise, providing you are careful not to use too heavy a current for charging.

Soldering Radiators.

2426

From G. F. Freberg, Minnesota.—Will you please send me the regular kind of fluid to use for soldering radiators. I want something that will clean the old paint and grease and dirt out of the tubes. What kind of acid is the best to use for this and what do they use to cut it with. Is there anything else besides zinc to cut the muriatic acid. Will you please send me the best recipes that you have?

Reply.—Before beginning to solder the radiator, all of the grease and dirt should be cleaned from the parts to be soldered, with a strong solution of potash-lye and water. This solution will act on the grease and will not damage the tools or make it hard for the preparation of the part for soldering. Mix up a soldering solution of muriatic, or so-called hydrochloric acid, and water—about half and half. Into this solution cut or file some metallic zinc, as much as the solution will dissolve. The writer makes a point of leaving a small piece of zinc in the solution at all times. After this has been allowed to stand for about 24 hours, it is ready for use on the radiators.

With the potash solution and the soldering fluid, you should have little trouble in soldering radiator tubes.

Worn Cams.

2427

From Jacob A. Rettig, Indiana.—I have an Allen Model 34 Touring Car. It has made 5,700 miles, and has a tapping sound between the second and third cylinders, most notable on the cam shaft inside. In fact, the whole engine seems to be noisy. I have noticed that the second and third cylinders have a little less compression than the first and fourth cylinders, but valves and tappets are all right, and there is no carbon. That part has all been gone over. I have noticed that two other Allen machines have the same tapping as my car has, but not as loud, and mine only taps once to every revolution of the cam shaft. Is there something that can go wrong on the cam shaft?

Reply.—If the car is an old one the trouble is probably due to the fact that the cams are badly worn. In most cases cams become flattened on one side, and every time the shaft turns over the rough places catch on the valve tappets. It is very possible, too, that the tappets' faces are badly worn, and if they are the noise would probably sound the same. A possible cause might lie in the looseness of the tappet guides, that is, if this machine is fitted with tappet guides. Every time the cam presses against the side of the tappet, the guide is pushed to one side of the housing, resulting in quite a little noise.

We assume, of course, that you have adjusted the valve clearance properly. This distance should not be more than the thickness of an ordinary business card while the engine is cool, and not more than .002 while the engine is hot. The trouble that you have with the loss of compression may be due to the fact that the cylinders are worn out of round.

If this is the case, the reboring of the cylinder is practically the only remedy for the trouble. If the cylinder, however, is smooth and unscored, you might try the installation of a set of leak-proof rings, obtainable at most any automobile repair shop. We

Digitized by Google

should advise you to go over the engine thoroughly, examining all of the bearing surfaces. This means the three main bearings, their caps and babbitt liners, the cam shaft bearing, the tappet guides, the valves and the valve guides. In practically every case the fit should be tight, and there should be little or no noticeable play in any of the members.

What your engine needs probably is a thorough overhauling, and if you have had any experience in the machinery line should have little or no trouble in doing this work yourself, though it might be wise to call in an experienced garage man for a consultation. This man could probably give you a few points so that you could do much of the work yourself.

Push Rod Repairs.

2428

From W. L. Richmond, Florida.—I have the R. E. O. 1913 Model, with which I have made about 12,000 miles, and I find a great deal of noise in the lower valve lifter guides. The valve lift rollers and guides are not worn, neither is there any wear on the cam shaft, but there is some wear on the top ends of the push rods and pins. Will you please tell me how I can stop this rattle? I have done all repairing on my car.

Reply.—The noise in your valve lifters may be caused by the wear of the cams or the wearing out of round of the tappett rollers. Run the engine until it has warmed thoroughly, then adjust the valve stem sections until the distance between the valve stem and the tappett is about .002 of an inch. If this does not stop the noise you might examine the cam shaft bearings and be sure that they are both tight on the shaft and tight in the engine housing.

Differential Trouble.

2429

From H. V. Kern, Minnesota.—I have an Overland 810 Model and the rear gears howl. Is it easy to take up the play or not?

Reply.—You should have no trouble in adjusting rear axle gears if you follow these directions.

First see that the pinion drive gear is tight in the housing and has no end play. Remove the cover plate from the differential and you will find a large adjusting collar on each side of the differential housing. This collar is kept from turning by a little locking device which must first be unlocked. Turn the right end collar until the master gear can be pushed tightly against the pinion gear. With your fingers feel the two gears and be sure that the edges of the teeth coincide, that is, the edges of the teeth are in line. Bring the left adjusting collar up against the bearing. The master gear will now be meshed too deeply so back off the left adjustment about 1/64 of an inch. Jack up both rear wheels, fasten a wooden handle to the pinion gear shaft at the universal joint and turn the shaft by hand. In this way you can set the gears back and forth and bring them to the point where there is the least noise.

Be sure to adjust both collars so that there will be only about 1/100 inch play in the differential or a barely perceptible amount. Be sure to put back the locking device when you finish the job.

Velie Valve Timing.

2430

From H. S. Goodell & Company, Michigan.—We have a 1913 Velie touring car, No. 31106, 4 cylinder, model R. The chain, driven by the crank shaft, runs the cam shaft and magneto. We took the chain off and in doing so did not mark the position of the cam shaft. We therefore got the intake and the exhaust valves out of time with the cylinders, on account of the crank shaft not being in the proper position. Please let us know where we must set the cam shaft so that when the No. 1 cylinder is on the top, ready for the downward stroke, the exhaust valve and intake valves for No. 1 cylinder will open properly. You need not explain the setting of the magneto because we know how to do this.

Reply.—The exhaust valve in No. 1 cylinder should close approximately five degrees before the top center.

While the intake should open about three degrees after top center, as a general rule the distance between the exhaust closing and intake opening can be divided in halves; the half mark being considered as top center. For instance, we will assume that you can mesh the cam shaft gear so that the exhaust closes 1/4 of an inch before the top center, a setting which causes the intake to open 1/4 of an inch after top center.

This would be what might be termed an ideal setting but impossible because of the gear teeth pitch or chain length. To mesh the gears or connect the chains you might have to advance the timing so that the exhaust closes slightly before 1/4 of an inch from top center, allowing the intake to open slightly 1/4 of an inch on the down stroke.

Leaking Storage Battery.

2431

From Charles H. Reker, Ohio.—I have a 12 volt Willard battery in regular service in a Dodge car, and the battery apparently is leaking. The cells test from 1124 to 1250 specific gravity. The volt meter readings are nearly uniform and a little over two volts per cell. The battery starts the motor perfectly at the present time and is about two years old. I would like to prolong the life of this battery if possible. How is the density of the acid tested? This has no doubt weakened in one or more of the cells due to the leakage. Also, is the piston pin in a Dodge piston stationary, or is it clamped in the connecting rod to oscillate with the rod. What is the size of the Dodge rings? Have they a step joint or a plain diagonal cut?

Reply.—We do not quite understand what you mean about leakage in your battery. The electrolyte in a fully charged cell should have a specific gravity ranging from 1.285 to 1.300 and the voltage of each cell should be at least two.

The leakage of the electrolyte would be evidenced by the necessity for frequent additions of distilled water, and in this case a new jar would be necessary. The leakage of current would be indicated by a rapid drop in the specific gravity. We can give you no definite rule to follow in this but would advise you to consult the Willard Battery Service Station man for only at the station can you obtain satisfaction. Battery up-keep is a branch of work that requires a great amount of study and knowledge. The piston

Digitized by Google

pin or wrist pin in a Dodge car is fastened to the piston and partially turns in a bushing in the connecting rod.

The Dodge rings are 3/16x3-7/8 inches and regular equipment consists of a diagonal cut ring.

The pistons in this car are straight turned and have a clearance of .0025 of an inch at both top and bottom.

Connecting Rod Adjustment.

2432

From William Beaumont, Oklahoma.—I have an Overland No. 83 and find it rather hard to keep the connecting rod boxes tight. I do not know how much it has been run as I got it second hand but it looks all right. Do you suppose the cranks may be slightly flattened?

Reply.—Your trouble with the connecting rod bearings may be due to the fact that you do not fit them properly. Are you sure that you fit these bearings with the babbitt so they contact with the crank pin the full length? If there are high spots on the babbitt the machine will run for a time until the high spots are pounded down, then the bearings will be loose. You may tighten them up, and these high spots still remaining, will be in turn pounded down, leaving the bearing loose. The proper way to fit the bearing is by the Prussian blue spotting method, that is, covering the crank pin with a small coating of the blue and clamping the connecting rod in place. Turn the crank over two or three times and then remove the rod, scrape off the high spots which will be indicated by the blue marks and repeat the process until the babbitt contacts a full length of the crank.

Very careful measurement of the crank pin will show whether it is round or not. It very seldom wears out of round, but if such is the case, you will be obliged to remove the crank shaft from the engine and have the crank pins ground back into shape.

Dodge Car Mileage.

2433

From A. E. Barker, Colorado.—I have a Dodge 1916 car and would like to hear from some of your other readers as to what success they have had in getting greater mileage and more gasoline economy. I should like to know what devices they have found to be of advantage in obtaining efficiency.

Reply.—The writer has had considerable experience with Dodge cars as well as a number of other cars of 25 h. p. and less, and his personal opinion is that the Dodge cars in this part of the country should give slightly better than seventeen miles on a gallon of Texas gasoline.

The owners in the East, and we speak of those from Maine to South Carolina, have been averaging from seventeen to twenty miles on a gallon. We doubt very much if you are able to obtain this mileage for the very reason that climatic conditions in Denver differ greatly from those in the East. In the first place, there is considerable moisture in the air in this part of the country which affects the engine, in that more mileage is obtainable.

We should therefore suggest that you obtain one of the devices designed for admitting water vapor into the cylinders through the manifold. This is practically the only device which would make for greater mileage in your case; if, however, you are troubled by the engine refusing to start, you might install the carburetor heating device or a hot air stove.

Clogged Radiator.

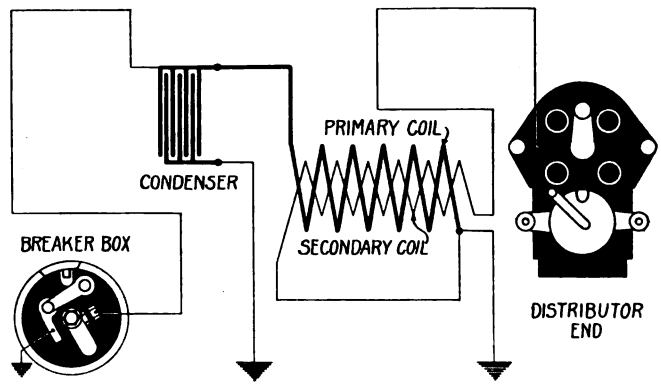
2434

From O. I. Oldersham, Connecticut.—I have a Briscoe 624 model which heats up and boils. I think it is due to the radiator being partly clogged. Can you tell me of anything that will clean out the dirt and rust. Would a little lye or potash harm the radiator if it were rinsed out carefully.

Reply.—For cleaning the radiator and cooling system of your Briscoe car, you might try a strong solution of potash, lye and water or a solution of washing soda and water.

Deposits which may not be dissolved by one of these liquids will in all probability be dissolved by the other. Be sure to strain through a cheese-cloth or fine copper mesh before putting into the radiator.

Draw off all of the present water from the system and replace it with a cleaning solution. Allow the engine to run for a few minutes until the solution has been warmed thoroughly. Then allow it to stand for half an hour. Start the engine again until it is heated and fully circuited, then draw it off and replace with clean water. If you have running water you might turn the hose right into the radiator and let the engine run for a few minutes until all of the cleaning solution has been removed. Either of the solutions recommended should do no harm to the radiator or connections.



Reason for Grounding Certain Wires.

2435

From W. L. Pearson, Minnesota.—Will you kindly tell me why it is necessary to ground either the positive or negative poles of the batteries used for ignition on the Maxwell car?

Will you kindly give me a sketch of the internal windings and connections of the Eiseman high tension magneto as used on the Dodge 1915 model car?

Can batteries be used in conjunction with a Bosch high tension magneto, without using a separate coil?

Internal Wiring Diagram of Eiseman Magneto.

Reply.—The ignition system in the Maxwell car requires that the dry batteries used for ignition be connected in a certain way, for the very reason that the current generated in the magneto is always in a certain direction.

If the batteries were connected wrongly, the cur-

Digitized by Google

rent from them would retard the current from the magneto, rather than assist it. In the case of the Atwater-Kent Ignition System on the Maxwell, the dry batteries act in conjunction with the storage battery and for this reason the grounded circuit should be the same. We are enclosing a sketch of the Eiseman high tension magneto, used on the Dodge 1915 car.

Dry batteries cannot be used satisfactorily with a Bosch high tension magneto without using a separate coil, for the very reason that the current generated by this magneto is alternating, and if batteries were used in connection with the magneto, the current from the batteries would act against that generated by the magneto.

Seizure of an Automobile for Services.

2436

From Martin J. Welch, New York.—Can you tell me the law, as it stands in New York State, relative to the seizure of an automobile for services on same and for supplies?

Reply.—We quote below Section 184 of the Lien Law of the State of New York which was given us by our attorney:

> "A person keeping a garage or place for the storage, maintenance, keeping or repair of motor vehicles . . . and who in connection therewith stores, maintains, keeps or repairs any motor vehicle or furnishes gasoline or other supplies therefor at the request or with the consent of the owner, whether such owner be a conditional vendee or a mortgagor remaining in possession or otherwise, has a lien upon such motor vehicle for the sum due for such storing, maintaining, keeping or repairing of such motor vehicle or for furnishing gasoline or other supplies therefor and may detain such motor vehicle at any time it may be lawfully in his possession until such sum is said."

It should be noted from the statute above quoted that possession is essential to the lien. If the automobile gets out of the possession of the garage owner or repair man, the lien is lost and the only remedy is to collect by the usual law suit.

Atwater-Kent Ignition System.

2437

From C. L. Smith, Connecticut.—Recently my garage man installed an Atwater-Kent Ignition system on my Model 35 Oakland, 1914 car. It does not seem as though the spark at the plugs were hot enough to ignite the charge in the cylinders. How can I remedy this trouble?

Reply.—We should suggest that you examine the platinum contact points in the breaker box of the Atwater-Kent Ignition units and see that they separate .006 of an inch when the breaker arm is riding on the top of the cam and also see that the surface of the points are smooth and flat.

If you will have trouble after repairing the breaker points, it may be that the current used for ignition is not strong enough. The current should be about six volts, and if you are using a six volt battery, it should be sufficient to give you a good spark. If it is not, examine all of the connections and the wiring, to be sure that everything is in condition.

Starting Lambert Car on Hill.

From B. D. G., West Virginia.—I hope that the following will be of interest to Mr. F. S. Pickering, who asked question number 2334 relative to the proper method of starting a Lambert car on a steep hill or other hard pull.

Starting a car of this type under a load is a matter of practice and study of the various speeds of such a car, as well as the proper application of the friction pedal. One must learn how much speed to give the engine in order to move the car and how firmly to apply the friction pedal to drive the car. The pedal should be applied gradually but firmly, but should not be pushed or jammed too suddenly. As the pedal is applied, the brake should be carefully released, so that as the clutch pedal is thrown in, the brake pedal throws out. At the same time the throttle must be advanced enough to keep up the engine speed.

We have very steep hills and mountains here in Virginia, as well as in Maryland and West Virginia, where I have been running my car. After I mastered the control of the car, I find that I can stop on any hill or mountain and start again very easily and without a jerk or jar.

The friction drive is very valuable for braking in descending steep hills or mountains, and used as a brake. I have run my car nearly three years, and only recently have had new brake bands put on.

Answers for Many of Our Readers.

From F. J. Williams, Iowa.—I am enclosing my renewal subscription money, and want to give a number of answers to questions in the February number of the Automobile Dealer and Repairer.

2342—You might tell M. Jessup of Michigan, that he should use less oil and a heavier grade, then he would have less trouble. I think his oil level is too high.

2345—Tell Mr. W. S. Wright of New York that his engine would never heat if it was in good order and the radiating system clean.

2350—Bruck Junk of Ohio should use heavier oil in his engine.

2359—Tell Mr. Lloyd Reeve, of New Jersey, that I have had a world of experience in burning kerosene, and I will say why I don't think it can be burned with success. The compression should be about 10 pounds more for kerosene and the carburetor should be different from a gasoline device. The engine must be designed for that sort of fuel and the kerosene kept at the boiling point. With the kerosene, water must be fed into the engine. The piston should not travel over 800 feet per minute when kerosene is used. Gasoline burns at about 160 degrees while kerosene requires from 212 to 220 degrees, bringing us back to the vaporizing question. A kerosene engine requires perfect ignition.

2361—Tell Mr. Harner, of Virginia, that an engine designed to be cooled with water should be so cooled and one for oil cooling should be cooled with oil.

Carbon Accumulations in Crankcase.

From Chas. Edward Prior, Jr., Connecticut.—Referring to query number 2351, in which Mr. Joseph Montag of New York inquires "what causes the accumulation of granules of carbon in the crankcase of an engine?" I would like to add my opinion to yours,

Digitized by Google

thinking that possibly one source of the trouble referred to has been overlooked by your technical department.

One of the cars which I once owned caused some trouble of the kind referred to, and I came to the conclusion that carbon formed on the underside of the piston head, and after a time, owing to vibration and perhaps to other causes, separated itself from the surface on which it formed, then dropped into the crankcase in the form of granules.

It is well known that pistons run very hot. Piston heads being very thin, the temperature of the underside would be practically as high as would be that of the top exposed to the flame, and as sometimes the carbon on the top of the piston is in the form of granules, it seems not unreasonable to believe that carbon accumulates in large quantities in some engines in the above manner.

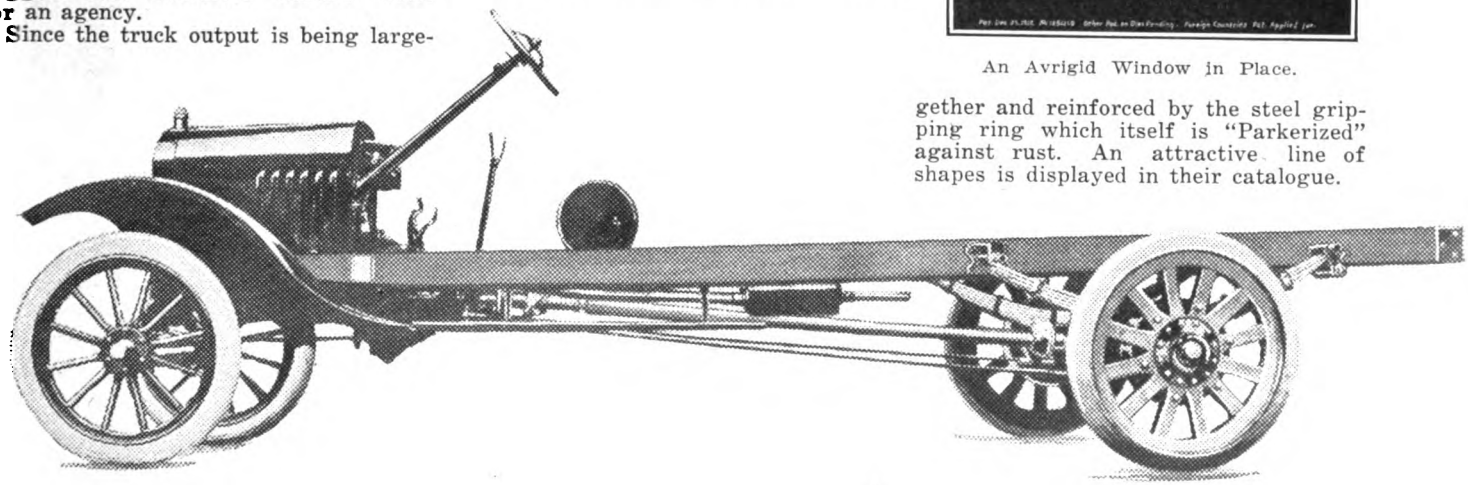
Editor's Note.—We have never heard Mr. Prior's theory advanced before, but undoubtedly it accounts for the trouble experienced by Mr. Montag.

Reply for Mr. Montag.

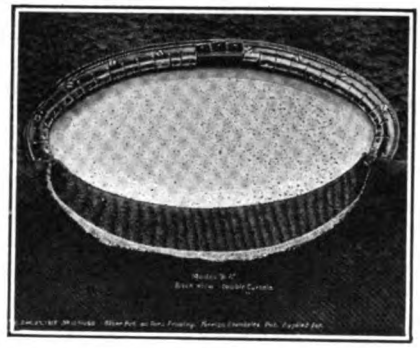
From B. W., Illinois.—Although a reader of your magazine for only three months I have gained a few helpful hints by reading your answers to questions in this department. I cannot altogether agree with you in answer to No. 2351. While some free carbon is carried in many auto oils, I do not believe there would be so much that it would settle in the crank case. I presume Mr. Montag found the carbon granules when he removed the crank case, after the engine had been run for some time, and not when he got his car from the repair man. If this is the case,

(Continued on Page 77)

NEW AND INTERESTING THINGS IN MOTORDOM



Burlington Truck Unit.

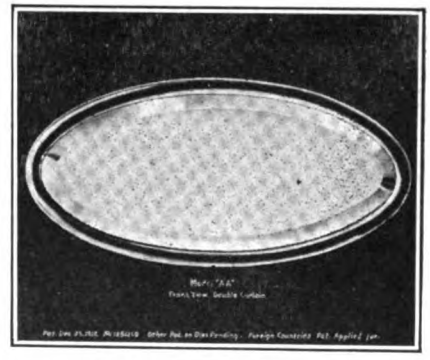


With the passing of every week, one finds the list of trucks in use increasing steadily. Many of these trucks are made from old passenger cars, and the car generally used for this purpose is the Ford. This machine may be adapted very readily by various truck units and the Burlington is one of these. This arrangement has been carefully designed and in such a manner that, with but little alteration, the Ford car may be made into a practical light truck.

The Burlington unit consists of a heavy steel channel frame well braced and reinforced by riveted plates and elbows at the corners. Two semi-elliptic springs, extending parallel, support the frame at the side, while a single semi-elliptic spring of peculiar design, called the helper spring, is fastened just above the axle at the back upon a cross member. This spring is intended to take the load when it grows excessive and the side springs are straightened out. The rear axle is of I-beam construction, all of the load being taken by it through roller bearings. The drive is by internal gears upon the wheel cones. The unit is designed to be put in place of the Ford rear axle and when it is in place the chassis is extended to a sufficient length for a large truck body.

The manufacturers, Burlington Motor Truck Co., of Burlington, Wisconsin, suggest that interested dealers write for an agency.

Since the truck output is being largely taken over for army use, there will doubtless be a great demand for conversion units of this type throughout the coming year, and we would advise our readers to get into this field as early as possible.



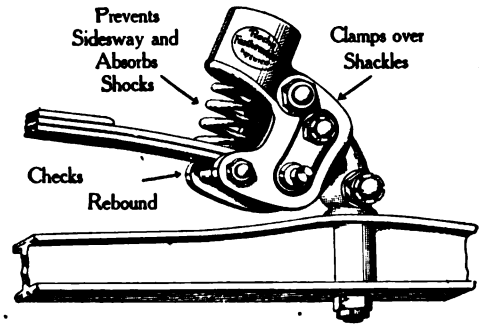
Applying the Avrigid Curtain Window.

Avrigid Curtain Windows.

The "Avrigid" plate glass auto curtain windows, manufactured and distributed by the Ever Rigid Auto Window Mfg. Co., 1017 S. Figuaroa St., Los Angeles, Cal., embody some entirely original features which should prove interesting to top rebuilders and manufacturers.

A spring steel gripping ring is used provided with resilient gripping fingers which hold the curtain material secure against tearing out and at the same time provide a cushion against which the plate glass is held firmly but without possibility of breakage. The construction of the retaining ring permits the tightening of the glass against this gripping ring by screws which may be safely set to their limit of tightness. The "Avrigid" is stated to be the only window with which it is possible to have the curtain flush with the plate glass and is entirely leak-proof.

The "Avrigid" may be neatly installed in either single or double (lined) curtains, with a retaining ring or without and also in conjunction with a wooden frame. Retaining rings are of heavily nickeled brass. The wooden frames are of non-warping construction, comprising two members glued together and reinforced by the steel gripping ring which itself is "Parkerized" against rust. An attractive line of shapes is displayed in their catalogue.



An Avrigid Window in Place.

Featheride Shock Absorbers.

Doubtless every reader has wished that he could make his car ride as smoothly as the more expensive machines. The

Featheride Shock Absorber Applied.

Roche Electric Manufacturing Company, 215 North Division Avenue, Grand Rapids, Michigan, claim that their product, the Featheride shock absorber, when applied to a Ford car gives absolute satisfaction, in that the device prevents side sway, checks the rebound and absorbs shocks. This device consists of two small malleable iron jackets, a heavy steel coil spring and two bolts, and is clamped to the spring shackles without changing any part of the car. The illustration shows the device as applied and we would suggest that any of our readers desiring to purchase the shock absorbers write the manufacturers.

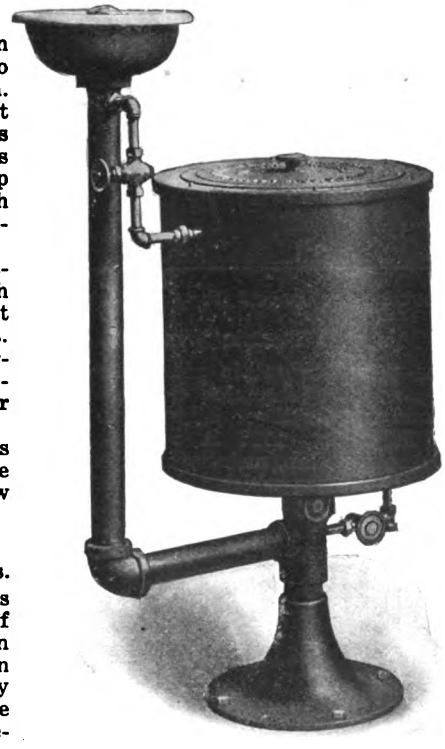
Bay State Autokit.

Prevention is better than cure, but an unprepared autoist is often unable to cure troubles, much less prevent them. An automobile requires a certain amount of attention that cannot be given unless the driver has the necessary repair tools and for this reason the Bay State Pump Co. manufacture a handy tool kit which is marketed by Geo. A. Cutter of Taunton, Mass.

This tool kit contains a large assortment of socket wrenches together with a heavy swiveling, reversible ratchet handle and several extension shanks. These fittings, together with a universal joint, enable one to reach and remove or tighten practically any nut or bolt in the automobile.

Every autoist should investigate this interesting line of tools which may be obtained in two sizes and at very low prices.

The Gas-E-Co System for Ford Cars.



The Gas-E-Co system for Ford cars is a device for increasing the power of the car, also reducing the consumption of gasoline and eliminating the carbon trouble, which is such a nuisance on any car. This system includes a needle valve control which automatically reduces the consumption of gasoline in proportion to the demands on the engine and insures smooth running, also a vaporizer which serves as an auxiliary mixing chamber and automatically maintains the maximum efficiency of the gas at all engine speeds.

Another feature of this system is the decarbonizer which automatically supplies the engine with the moisture necessary to produce the maximum of power and to totally eliminate carbon. It is stated that there is always a fat spark on Gas-E-Co equipped Ford cars, because the spark plugs are always clean, and it is also claimed that this system will increase Ford mileage an average of 30 per cent. This device is sold for only $10.00 at retail with parcel post charges fully paid and also with a full money back guarantee. Readers who are interested should write for an interesting free booklet covering the subject of air mixture, vaporization and decarbonization to the manufacturers, the Gasoline Economy Co., 1103 Colonial Trust Building, Philadelphia, Pa. The same company also has an attractive proposition for dealers desiring to handle an article that is a wonderful good-will producer and that sells itself in any community where it has been introduced. Dealers should write for the special selling plan which has been adopted by this manufacturer.

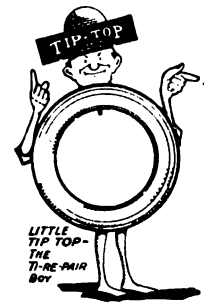
Bubbling Fountains.

The wise garage man looks to the comfort of his employees for he realizes that as long as they are satisfied they will do their best work for him. Personal comfort is of prime importance and the garage drinking water supply should be carefully looked after. Illustrated herewith is a device manufactured by the Manufacturing Equipment & Engineering Company, Framingham, Mass., which may be attached to the municipal water supply in any garage and is made in a number of styles either plain or ice cooled.

The illustration shows style number

One Style of Bubbling Fountain.

604, which is arranged to take 75 pounds of ice in a cork insulated refrigerator box.



Hi-Comp Piston Ring.

The heavy fuel problem is the biggest which confronts the motorist today and in order to obtain efficiency from an engine it is necessary that the piston rings prevent all passages of gasoline into the base. With the leakage of fuel past the rings comes another serious problem, that of dilution of the lubricant. The motorist then should be doubly careful in obtaining piston rings which fit the cylinders and do not allow the passage of gas into the base.

A ring, which is said to be efficient, is manufactured by the Continental Piston Ring Company of Memphis, Tenn., and termed a Hi-Comp piston ring. This device is made in two parts and is so designed that an even pressure is maintained around its circumference. A special process grade iron is used as material for the rings and each ring is tested by micrometer examination.

"Little Tip-Top" Advertising Figure.

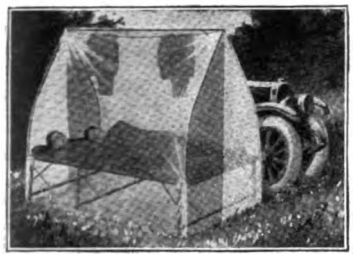
The little figure at the left is becoming familiar to readers of the Automobile Dealer & Repairer through its use

by the Akron Rubber Mold & Machine Co., in their advertisements of Tip-Top Ti-Re-Pair Outfits.

This is one of the most unique and effective advertising characters now being run in the automobile publications, and in addition to attracting attention to the Tip-Top vulcanizer equipment, becomes readily remembered by readers and at once identifies this particular make of equipment wherever its advertisements are seen.

"Little Tip-Top" is said by the manufacturers to stand guard over the quality of Tip-Top Ti-Re-Pair equipment and in a sense this is true, as the manufacturers of a product that is advertised to be exceptionally high quality use the greatest care to see that their product lives up to its reputation.

Krom Nik Gears.



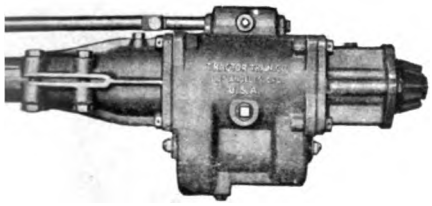
In remodelling the car for the coming season the owner as well as the repair man should investigate differentials and gears manufactured by the Krom-Nik Gear Company of Chicago, Ill., advertisement is given in this magazine. This company makes special gear ratios as well as differentials. The material used in the construction is of the best and our readers are requested to write this firm for details of their products.

Tentobed.

One of the reasons why automobile camping is not generally popular is because of the fact that the automobile is limited as to room and therefore a large car is necessary to carry the camp equipment. This objection does not hold true as regards the Tentobed manufactured by the Tentobed Company, 3422-3426 W. Lake Street, Chicago, Ill. This combination consists of a complete tent, 4 ft. wide by 6 ft. 4 in. long and a large bed for two adults. The complete outfit weighs 145 pounds and may be rolled

Digitized by Google

nto a package only 7 inches in diam-
ter and 4 ft. long. No stakes, ropes or
oles are required for pitching the tent
nd the material used is said to be wa-
er, mildew, mosquito, and insect proof
The outfit requires but five minutes in
etting up and is entirely self-support-



The Tentobed.

ng. Automobile owners should consider
he advisability of spending their vaca-
ion in the open air, this year, and the
Tentobed proposition should be of great
nterest to all.

Auxiliary Transmission for Fords.

Many Ford car owners fit their cars
or express or truck duty without con-
idering any changes in the transmis-
ion. The Ford transmission was de-
igned for passenger service only and
or heavy pulls and great loads such as
re had in trucks, it wears very rapidly.
To obviate the constant expense of
eplacement and repairs to the car, the
ractor-Train Co. of 1347 Wall St., Los
ngeles, Cal., have put on the market
ie Moore Auxiliary Transmission. This
evice is attached to the car between
ie gearset and rear axle and is a sec-
nd gear box containing special gear
atios to be used together with the
gular Ford transmission.
For heavy pulls in sand or mud the
uxiliary transmission may be used to
ve more power to the wheels in the
ape of a speed lower than the present
ord low. It may be used to give a
wer reverse ratio, or a lower high
eed. In the latter case, a hill which
too steep for the Ford high may be
egotiated with the intermediate had by
e combination of the auxiliary and
ord high speeds. In other words, the
oore transmission offers a set of
eeds lower than the three on the car;
the same time, however, the regular
tios are at all times available.
The device is easily applied and few

Moore Auxiliary Transmission.

anges are necessary. No welding or
azing are required in applying the
uxiliary transmission.

Holtzer Cabot Magnetos.

There is no part of a car's equipment
important as the ignition system. No
atter how good the car is, a poor ig-
ion system results in inefficient action
d a waste of fuel. Car owners who
e having trouble with their present
ignition systems and desire to change
should investigate the complete line of
magnetos and spark coils manufactured
by the Holtzer Cabot Electric Company,
Park Avenue and 40th Street, New York,
N. Y. This line includes many types of
machines either for direct drive or
through a governor by friction from the
flywheel.

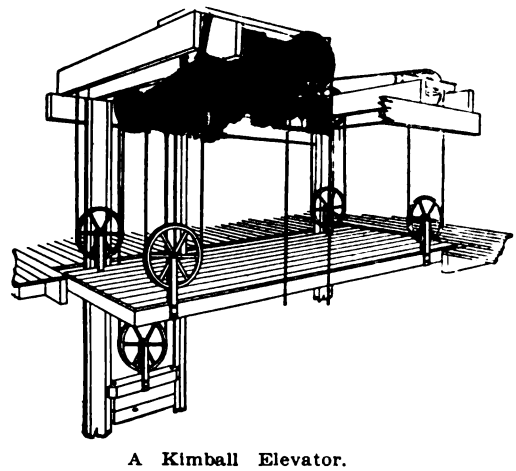
Workrite Battery Outfit.

The car owner is beginning to wake
up to the fact that his storage battery
is a very important part of the automo-
bile. He realizes that the starting,
lighting and ignition systems all depend
on the proper functioning of the stor-
age battery, and therefore he is edu-
cating himself to pay particular atten-
tion to this unit. One device which he
needs above all others is the hydrometer,
for with this he tests the electrolyte
and finds the general condition of the

Workrite Battery Outfit.

battery. Such a device is made by the
Workrite Manufacturing Co., 5606 Euclid
Avenue, Cleveland, Ohio.
This product is interesting because
of its construction. It is really a com-
bined hydrometer and battery filler. The
glass tube is fitted at one end with a
large red rubber bulb and at the other
with a filler tube. At the filler end a
large square rubber washer is furnished.
Contained in the filler is a hydrometer
accurately marked. The washer at one
end and the bulb at the other prevent the
filler tube from coming in contact with
the bench upon which it might be placed
and should it fall upon the floor, the
glass portion is protected by the rubber
pieces. In order to keep dirt away from
the device as well as to furnish a re-
ceptacle for distilled water, a glass bot-
tle is provided and upon this glass bot-
tle are placed directions for battery
maintenance. The whole outfit is well
worth investigating either by the garage
man or the repair owner.

Smith Auto Signal.



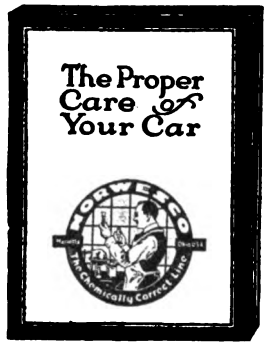
Beginning May 1, 1918, the firm of
Weiss and Sinclair took over the United
States distribution of the Smith Auto
Signal. They will give their exclusive
time to the promotion and sale of this
device.
They are now located at 42 West 39th
Street, but expect in the near future to
move their offices and force to the plant
of the Smith Signal Corporation, 53-55
West 66th Street, New York City. The
location of this sales organization at the
same place as the manufacturing plant
will keep both departments in closer
touch with each other and enable them
to better co-operate with old customers
as well as the new ones.

The All-Car Unit Company.

The production of passenger cars has
been cut badly this year and evidence
would go to show that the output of
trucks is as greatly diminished as is the
manufacture of passenger cars. For
this reason this year will see the con-
version of many passenger cars into
trucks; consequently there will be a big
demand for conversion units of all types.
The All-Car Unit Company, 1405 Real
Estate Trust Bldg., Philadelphia, Pa.,
are manufacturing a conversion unit
which is especially interesting in that it
is applicable to many of the passenger
cars now on the market. This unit is of
excellent construction and designed for
heavy work. The axle is of the internal
gear type and fitted with semi-elliptic
springs. The frame is made of heavy
steel channel stock well braced and rein-
forced at the corners. Dealers who are
interested in obtaining the agency for
this unit should write to the manufac-
turers.

Kimball Auto Elevators.

Many garages are badly handicapped
because they are limited as to space
for cars. They may have plenty of
room on the second story of the plant,
but none downstairs. Where this is the
case the garage man would do well to
inspect the line of auto elevators being
manufactured by the Kimball Brothers
Co., of Council Bluffs, Iowa. These ele-
vators are manufactured in many differ-



A Kimball Elevator.

ent sizes for hand or electric operation
and by installing such an elevator you
figuratively move the second story down
to the ground level.

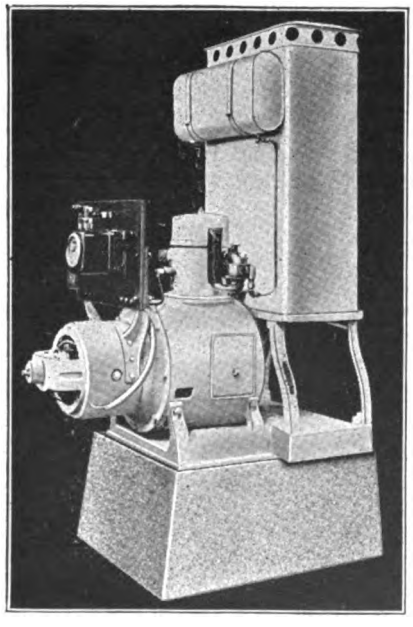
Proper Care of Your Car.

Quite in line with the nation's plan of conserving and preserving is the attractive twenty-four page booklet "The



Proper Care of Your Car," published by the Northwestern Chemical Company of Marietta, Ohio, manufacturers of the "Chemically Correct" line of Norwesco utilities.

This booklet is chuckful of practical hints for the motorist. It tells how to overcome and to correct some of the different ails a motor car is subject to. Unlike some booklets, it gives more than one remedy for correcting the most common troubles. In fact, it tells just what its name implies "The Proper Care of Your Car."

It is well illustrated and any motorist will find it serviceable and helpful. The readers of Automobile Dealer and Repairer can secure a copy postpaid by writing the Northwestern Chemical Company, Marietta, Ohio.

Unit Electric Plant.

The Gile Tractor & Engine Company of Ludington, Michigan, has standardized under quantity production a real utility size of electric plant—big enough for the average home and a price that is only possible where the plant is built

A Unit Electric Plant.

under one roof from foundry to paint shop.

In order to further reduce the cost of this plant an arrangement has been made with the Consolidated Utilities Corporation of Chicago to distribute it through their organization.

The rating of this machine is 600 watts, the engine is of the valve in head 4-cycle water-cooled type and operates at a speed of approximately 1,600 revolutions per minute.

The generator has an output of from 32 to 40 volts and is fitted with a controller and government arrangement if desired. The plant is self-contained and complete in all respects and may be used either for house lighting or for battery charging as desired.

A Stringent Screw-Driver Test.

With the unprecedented labor shortage, thousands of laymen are turning to mechanical occupations and naturally their knowledge of tool quality is limited as compared with that of the expert. Unimportant as the screw-driver seems to be, it is one of the most used tools in the mechanic's kit, and consequently has to bear the brunt of the amateur's bunkling.

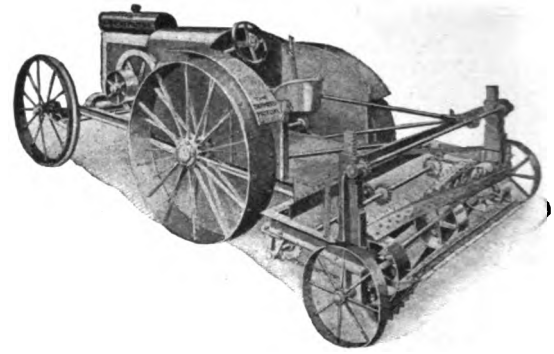
A test was recently given a stock

A Stringent Screw-Driver Test.

Yankee screw-driver which seems to prove that this product made by North Bros. Manufacturing Co., Philadelphia, Pa., possesses great merit. One of the salesmen took a heavy sledge hammer and from it he chipped the trade-mark letters, using a Yankee screw-driver No. 90 and a one-pound driving hammer. After doing this he laid the blade flat, hammered a slight bend in it and resumed cutting. Following this he straightened the blade out again and smashed his hammer down upon it endwise. After this severe trial the handle still remained firm upon the blade and the blade was in good condition for use under ordinary conditions.

Bulb Tester.

The Metal Specialties Company of Chicago has introduced a new accessory that has made a pronounced success. This article is the Presto Bulb Tester.



This is a Bulb Tester for testing all sizes of automobile light bulbs with Ediswan base. When a dealer sells you an electric light, he will test it right before your eyes, showing that the bulb is good and proving to your satisfaction that you are getting the right bulb and a good one.

It tells you instantly whether the bulb is burned out or not. The lever switch has different contact points for one and one-half volts, three, six, nine and twelve-volt bulbs. It attaches to any ordinary 110-volt lamp socket. Equipped with seven feet of lamp cord. It is enclosed in a neat metal case, black enameled with nickel-plated trimming. Every live dealer has a Presto Bulb Tester so that he may test all the bulbs he sells you, and when you buy a bulb tested in this manner you know that the voltage is exactly what you are paying for and that the bulb is perfectly good.

Currier Rotary Tiller Plow.

All garage men should investigate the possibilities offered in the field of tractors, and especially the proposition of the Farmer's Mutual Plow and Tractor Company of St. Louis, Mo. This Company's product is termed the Currier Tiller Plow and is especially interesting because of its low price. The weight of this machine is but 110 pounds, yet this is said to do the work of three men and reproduces the handwork of a hoe.

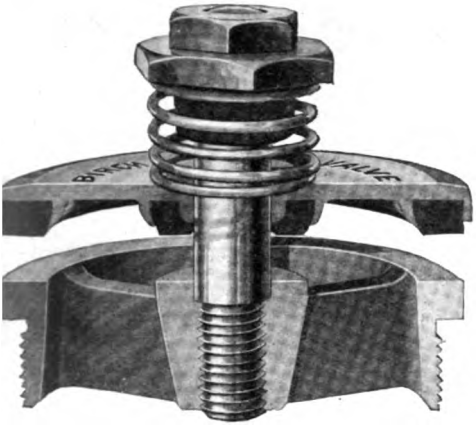
This machine is fitted with a four-cylinder oil-burning engine, the power from which drives directly through the rotating blades at the rear. The propulsive power is obtained through the rotation of these blades which operate upon the principle of a lawn mower. The

Currier Rotary Tiller.

blades are made in sections so that in case of breakage one or more may be replaced without changing any of the others. The manufacturers are putting this machine on the market at a very low price and it should attract considerable interest among the small farmers.

High Tension Magneto for Ford Cars.

A trouble which frequently bothers the Ford owner is often caused by the ignition system. This trouble is particularly noticeable upon the older models and may be obviated by the installation of a high-tension magneto. Such a device may be purchased from the Magneto Parts Company, 1790 Broadway, New York, N. Y., at a very nominal figure. This high-tension magneto attachment has been designed especially for Ford cars and is so designed that it may be put into place on the front of the engine in a very short time. With this attachment any of the standard high-tension magnetos may be used.



General's First Aid Kits.

The General Tire & Rubber Co., of Akron, Ohio, have introduced a war-time tire accessory that is said to be in great demand among automobile owners. In their first aid kits, the car owner receives an all-rubber patching material that enables him to keep his tires in condition. These kits are made in three standard sizes, any one of which contains material for mending tubes, automobile tops, or other rubber articles.

Digitized by Google

Birch Pump Valves.

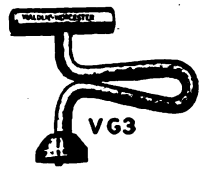
Illustrated herewith is a cross-sectional view of the Birch Pump Valve manufactured by Birch-Hintz Mfg. Co., 1100 So. Kilbourne Avenue, Chicago, Ill. As the illustration indicates, the valve portion is made in two parts. The lower or seat part is ground to a perfect face and heavy enough to withstand pressure strains without being distorted. The upper portion is fitted with rubber faces

Cross Section of Birch Pump Valve.

which are cured separately and securely locked in the body by a rolled metal lip. The two portions are held together by a stud upon which is mounted the spring which may be of barrel, spiral or beehive type. This valve is made in many sizes for various standard types of pumps. For further details write the manufacturers.

Butler Pistons.

The Butler Manufacturing Company of 1121 E. Georgia Street, Indianapolis, Indiana, are manufacturing a lightweight, semi-cast, as well as a standard cast-iron piston in both standard sizes and in oversize, together with piston rings and wrist pins, a line which should be investigated by repair men. This firm also does cylinder regrinding and piston fitting for all makes of cars.



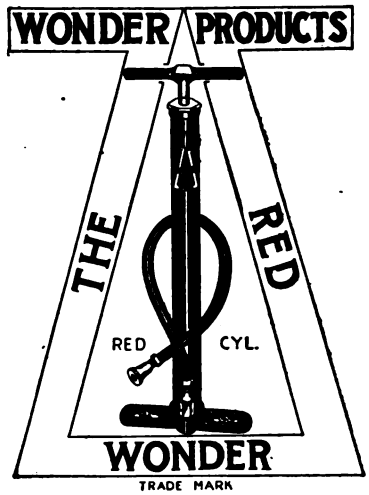
Two Excellent Repair Tools.

The A. & H. Mfg. Co., Inc., 505-507 West 45th Street, New York City, are the manufacturers of the A. & H. true threader tool. This tool is said to recut absolutely true the worn threads of a leaking tire valve and make it airtight. The device takes up less room in the tool kit than a pair of pliers. It is made of the highest quality material, automatic adjustment, and no skill is required to use it. The retail price of this tool is $1.50, but it is worth many times more than its cost to the tourist every time it is needed, as it saves tires, time and money.

The same company has now brought out another tool called the A. & H. valve repair tool, which is really a wonder. With this repair tool one can recut outside stem threads, take off hexagon nuts, remove broken plungers, ream off rough nipples, recut inside plunger threads, recut outside nipple threads and take out plungers. This tool is endorsed by all the leading tire manufacturers and just now the A. & H. Mfg. Company is making a special offer to furnish this valve repair tool described above in a combination offer of $2.00 for both tools. Readers should carefully inspect the advertisement which appears for the first time, from this company, in this magazine and then send orders and inquiries direct to the manufacturers.

Valve Grinder.

The Walden Worcester, Inc., of Worcester, Mass., put out a very interesting line of special wrenches and tools for automobiles and we want to call the attention of our readers to one of their devices which is designed for Ford cars in the shape of a wire handle valve

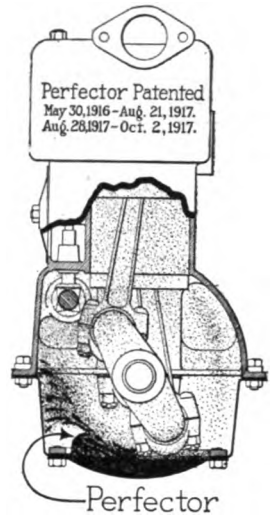


Valve Grinder.

grinder. This device is said to be the first of its kind ever made and sells for an exceedingly low figure. The wire handle is fitted with a 5/16-inch bar handle swiveled on a cone bearing. The other end is fitted with a socket which carries two hardened steel pins designed to fit Ford valves.

The Red Wonder.

Tire trouble is one of the annoyances that no automobilist is free from; and this annoyance is doubly aggravating if

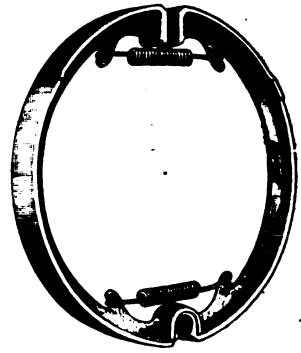


one does not have an efficient tire pump. The Red Wonder tire pump, made by Sidel-Rattner Mfg. Co., 14-18 Dunham Place, Brooklyn, N. Y., is said to be 100% efficient because of its excellent construction. This product is well constructed; the cylinder is made of heavy gauge steel, threaded into a heavy foot base. The valve is of solid brass, equipped with an indestructible flexible seat of special construction and claimed to be dirt proof and air tight at all times.

The piston is of patented design and fitted with a chemically treated cup leather, which makes for efficiency without excess friction. The pump is finished in japan and baked a glossy red while the handle is black enameled. All fittings are of solid brass.

Perfecto Ford Oiling System.

A very useful accessory has recently been invented and patented by E. M. White for perfecting the oiling system of the Ford engine. This device is very simple and free from all moving parts and is secured to the lower part of the crank case by small bolts. It is fitted with a curved surface which extends upward toward the crank shaft and which intercepts and deflects downward, the ex-



Application of the Perfecto Oiling Device.

cess and larger particles of oil splashed from the cranks by the connecting rods. The perfector has an atomizing effect upon the oil and instead of throwing the oil directly into the pistons, the base and cylinders are kept full of a fine oil vapor of high lubricating efficiency. This reduces the fouling of the spark plugs, the carbon deposits and makes for a properly lubricating engine. The device may be installed in a very short time by any ordinary mechanic, and is said to solve the problems of lubrication in the Ford engine.

The device is manufactured by the Perfector Manufacturing Co., Baker-Detwiler Bldg., Los Angeles, California.

Ford Brake Shoes.

The Adamson Manufacturing Co., East Palestine, Ohio, are marketing special Ford brake shoes which are guaranteed to give satisfaction. These brake shoes are made in two types, one unlined and the other lined with asbestos which has wire insertion and is riveted to the shoe. The faces of the shoes

Adamson Ford Brake Shoe.

which are in contact with the cam are specially hardened to prevent them from wearing out of true, and this is said to add materially to the life of the shoe.

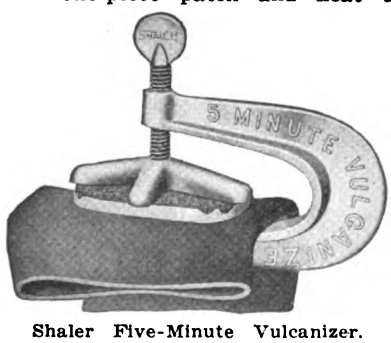
Digitized by Google

Tasgon Liquid.

Every car owner as well as every repair man realizes that more time is taken for hauling a machine to pieces than for actually putting it together, the reason usually being because of the fact that collections of dirt and rust prevent the removal of nuts and bolts. The Polygon Products Company, 141 Market Street, Boston, Mass., manufacture an interesting product which they term "Tasgon." This product is said to remove rust in all forms from machine parts. For this reason it may be used very effectually on rusty nuts and bolts for removing the corrosion before they are pulled apart. In addition to this, the liquid may be used in springs and hinges to stop the squeaks. The manufacturers also claim that Tasgon will prevent carbon from collecting in the engine cylinders if properly used.

Using Tasgon Liquid Rust Remover.

Smooth-On Instruction Book.



The 16th edition of the Smooth-On instruction book has just been issued by the Smooth-On Mfg. Co. of Jersey City, N. J., and this book contains 144 pages of information relative to the use of this product.

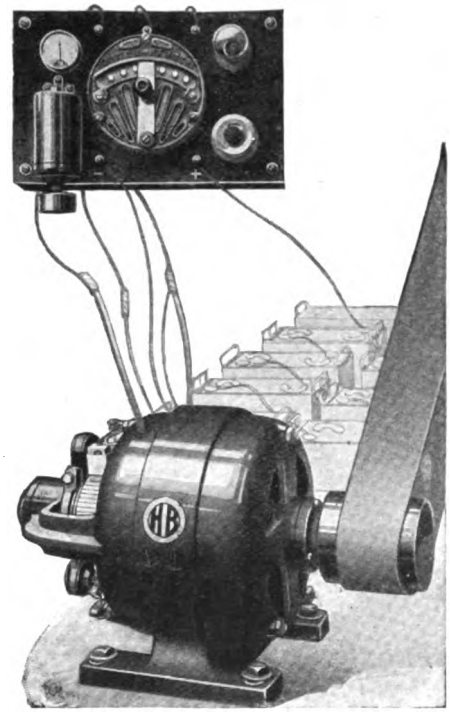
The various uses of Smooth-On Iron Cements are shown and any of our readers may obtain a copy by writing the manufacturers.

Shaler 5-Minute Vulcanizer.

There is no doubt that the best results in tire repairs are obtained when the patch conforms with the shape of the cut. A puncture should be patched with a round piece of rubber, while a cut should be repaired with a long narrow patch. The 1918 Model Shaler 5-Minute Vulcanizer made by the C. A. Shaler Co. of Waupun, Wis., is so designed that with it, both round and oblong patches may be applied.

The one-piece patch and heat unit assortment consists of the solid fuel, the vulcanizing plate, and the patch of raw rubber. The latter is of special construction, and with the fuel is protected against deterioration while in the dealer's stock or in the tool box of the car. Six each of the oblong and round patch units come with each outfit.

Shaler Five-Minute Vulcanizer.



The vulcanizer is substantially made of iron with ample strength to prevent breakage, and finished with a coat of rust-proof nickel.

The manufacturers run a printing department to supply dealers who carry the Shaler line with ample quantities of advertising matter.

The H-B Belted Charger.

Many garagemen throughout the country are desirous of installing battery charging outfits and the garage man who is anticipating such a step should investigate the H-B line of charging apparatus, manufactured by Hobart Bros. of Troy, Ohio. For the garages which do not have electric current the H-B belted charger should be of interest.

This device will charge seven 6-volt batteries or their equivalent at one time. It is operated from a line shaft or the engine, and requires approximately one h.p. With the device is furnished a switchboard fitted with an ammeter, a field rheostat, circuit breaker, pilot light and necessary fuses and cut outs. The machines may be obtained for cash or upon easy payments. In this latter method the garage man may pay for the apparatus from the profits of the business.

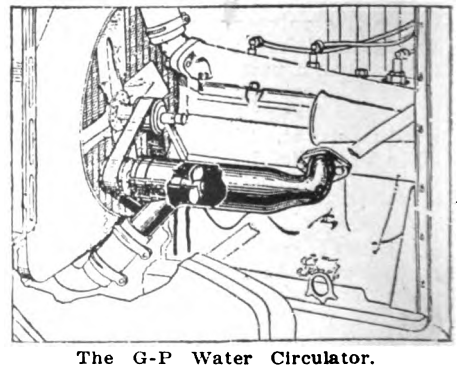
H-B Belted Charger Outfit.

The Bowers Magnet Tester.

This is a clever device which is really a combination magnet, compression and air pressure testing and indicating gauge. This invention was illustrated in the April issue of this magazine, but by an unfortunate error it was stated that this magnet tester is manufactured by the Bowers Mfg. Company of Grand Rapids, Mich. As a matter of fact the factory of the Bowers Mfg. Company is located at Grand Rapids, Minn., and readers who are interested in this device should write to the Minnesota town and not to the Michigan city.

Evr-Lastin Gear Compound.

A product which is said to make very efficient lubrication is manufactured by the Imperial Oil Company, 3140 Locust Street, St. Louis, Mo., and called Evr-Lastin Gear Compound. This is said to be a truly remarkable product and when in use in the transmission or differential it forms a thick protective coating that will not run or gum, preventing wear and assuring perfect lubrication. This product is said to be excellent for lubricating axles which are old and leaky, for it does not leak into the brake-bands. It is put up in 5, 10, 25, and 50-lb. tins; also in 225 and 400-lb. barrels.



Bull Dog Tire Patch.

The Iowa Tire Patch Company, Department A, Des Moines, Iowa, manufacture an interesting product called the Bull Dog Tire Patch which they guarantee to give satisfaction, if used according to directions. This patch consists of two plys of the best quality of raw red rubber, one ply of semi-cured rubber and a fabric backing which adds strength and durability. In applying the patch, no tools or heat are said to be necessary and the manufacturers claim that a patch may be applied in three minutes and the tire used immediately, without further work.

The G. P. Water Circulator.

In this issue the reader will notice a story dealing with the remodeling of a Ford car for speed work and he will find that there has been suggested an auxiliary water pump for circulating the cooling medium. Such a device is made by the Firestone Sales Company, 1806 So. Michigan Avenue, Chicago, Ill., and is illustrated herewith. This device consists of a fan pump mounted in a special casting which is applied in place of the present Ford water hose. The circulating fan is driven from the regular Ford fan and crank shaft. The device is easy to apply and is said to be very efficient.

The G-P Water Circulator.

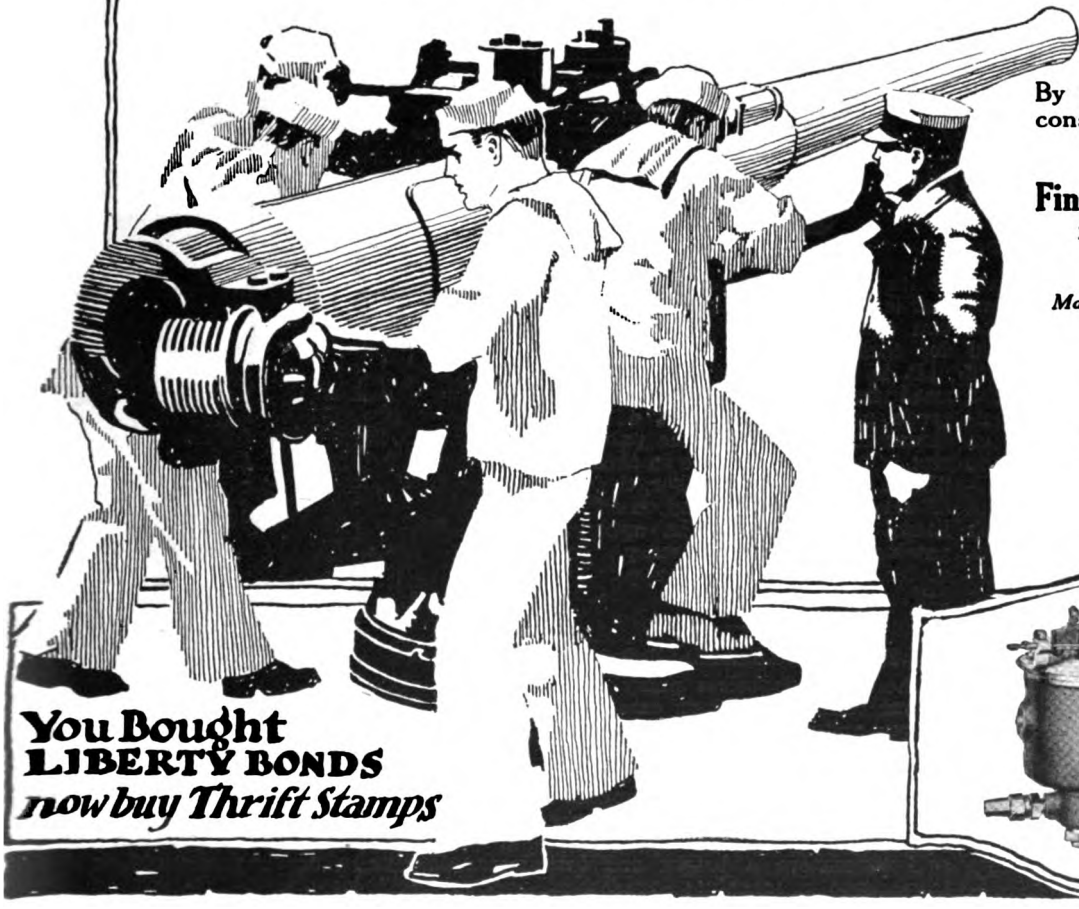
RAYFIELD CARBURETORS



Clear for Action!

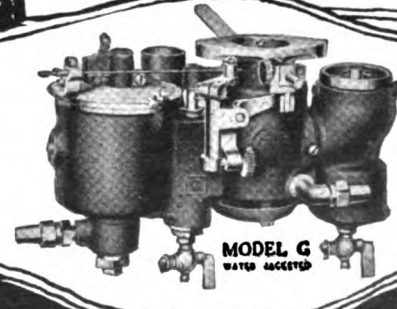
We are in this war to win. You can again help. When needed, the resources of our company will be placed unreservedly at the service of the Government.

Up to the present time, war demands have interfered but little with the production of RAYFIELD Carburetors.

However, any day may bring about big changes.

We are ready to do our part—to make a thorough job of it, we need your co-operation. By placing your order for the RAYFIELD today you will help us to ***clear the decks*** for Government requirements. Also you bring your car up to war standards, for the **RAYFIELD equipment means economy and efficiency.**

You Bought LIBERTY BONDS *now buy Thrift Stamps*



By practicing econony, you conserve for the Government.

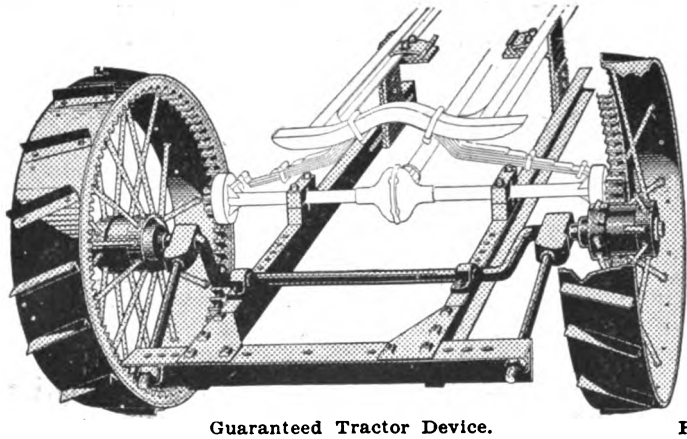
The Liberty Plane.

The Defender Auto Lock Company, 506 Marquette Bldg., Detroit, Michigan, are putting on the market an attractive radiator ornament which is a miniature



The Liberty Plane.

of an aeroplane. This device is cast in aluminum and is highly polished and decorated with the flying emblem in red, white and blue enamel on each wing. At the front is a propeller mounted in such a way that the slightest breeze causes it to revolve.

Guaranteed Tractor.

Now that spring is here, the farmer faces a situation which is unprecedented, for labor at this time is exceedingly difficult to obtain and the average farmer finds himself unable to cultivate all of his land without suitable farming implements. The answer to the question is "farm tractors," and should the farmer own an automobile he would do well to investigate the Guaranteed Tractor, manufactured by the Guaranteed Tractors, Inc., 2700-02 Michigan Avenue, Chicago. This device may be had to fit practically any of the standard automobiles now on the market and consists of a heavy frame upon which is mounted two large tractor wheels. The large wheels are fitted with internal cast gear teeth and the device is bolted upon the rear axle of the car after the wheels have been removed. In place of the wheels two spur gears are attached and these operate upon the tractor wheels through the internal gears. The guaranteed tractor device is so designed that it may be applied in a very short time and in this way the car may be used for passenger purposes as well as tractor work. Dealers and garage men should investigate the device, for a sideline of this sort especially at this time is very practical.

Guaranteed Tractor Device.

Revere Chassis.

A machine which bids fair to attract considerable notice this coming year is being turned out by the Revere Motor Car Corporation, 1638 Monadnock Block, Chicago, Ill.

A glance at the specifications shows many interesting features. The engine is a Deusenberg four-cylinder and had in two sizes, developing either 96 or 103 h.p. The oiling system is by pressure and arranged so that it may be adjusted as to height. For ignition, a Bosch high tension magneto is used. The clutch is of the multiple dry disc type, the discs being faced with a non-burn composition. A four-speed and reverse transmission is bolted to the engine unit and from it a power is transmitted to the rear axle through two universal joints. A full floating type of rear axle is used, fitted with helical cut bevel gears and standard roller bearings. Ample braking capacity is provided by two 16-inch brake drums. The steering gear is of the worm and gear type. Four types of bodies are to be had in 7, 5, 4 and 2 passenger arrangement.

Johnson's Hastee Patch.

Motorists will be glad to learn that S. C. Johnson & Son of Racine, Wisconsin, have just put on the market a new tire repair patch in three handy sizes. This product is termed the Hastee Patch and the makers claim that it is as quick as its name indicates. The patch material is put up in strips so that the user can cut just the size patch he needs for each repair.

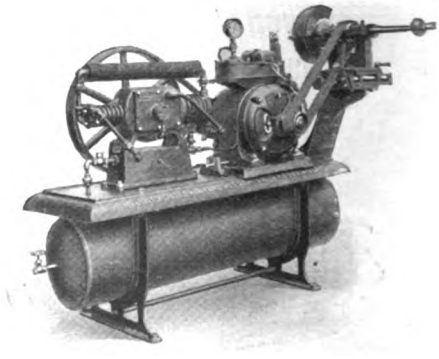
Hastee Patch Container.

It is claimed that the tube may be used immediately after the repair is made and that the heat of the road serves to amalgamate the patch on the tire. The patch is made in three layers; first a layer of raw rubber, then a layer of vulcanized rubber, and on the outside heavy khaki fabric. In applying the patch no cement is necessary. The only material used besides the patch is the self-vulcanized liquid.

Panvar Automobile Refinisher.

There are doubtless many thousands of our readers who own cars both passenger and delivery machines who are anxious to have their cars appear neat and clean at all times, and we want to direct their attention to a product manufactured and sold under the registered trade name of Panvar. This product is said to restore a bright and lustrous appearance to machines in cases where the finish has become dull, worn-looking or weather beaten. It is not intended for cars having the paint or body coat damaged for such cars require repainting.

Panvar may be used upon any paint, leather and upholstering and is applied with a soft brush. It is self-flowing and will give a smooth even coat upon the surface. The manufacturers claim that the product has great covering powers and therefore a quart can will refinish an ordinary car completely, including the tops and the sides with one coat.



It is quick drying and is claimed not to crack, peel or turn white from the use of water or steam. In refinishing the car for the summer season, we would suggest that our readers investigate this product. The Panvar, sixth floor of the Evening Bulletin Bldg., Philadelphia, Pa., will be glad to mail a sample of their product to all interested parties and they suggest that every garage man or dealer in cars write them for they have an interesting proposition to make.

Air Compressor Unit.

The United States Air Compressor Company of Cleveland, Ohio, which has been responsible for a number of new and very marked improvements in air compressor construction, has just developed a new machine unlike anything now on the market.

Realizing the need in garages and tire shops for an air compressor and a buffing or grinder head this company saw an opportunity of combining the two, thereby making a machine that would afford a number of advantages. The usual method is to buy the air compressor and buffer head separately with an independent motor for the operation of each machine.

The new United States machine combines the buffer and air compressor in one rigid unit, so that either may be operated independently or both at the same time by one motor. The motor is of one horsepower instead of the usual one-half horsepower size, which provides power for the most severe loads and it is completely enclosed to prevent entrance of dust or grit from the buffer. The pulley which operates compressor and buffer head are placed at opposite ends of the motor so that the load is equally divided. The buffer handles two eight-inch wheels and power is applied to it by turning a small hand crank. An automatic controller prevents overcharging of air tank and the entire machine is said to be as nearly fool proof as it is possible to construct.

Air Compressor Unit.

Cork Insert *takes hold* at the Slightest Pressure

A touch of the toe and the brake *responds*. The Ford comes to a quick, easy stop, without a shake or a jerk. No grabbing and tearing away—hence none of that racking vibration, which ruins the rear end of the car and causes heavy repair expense. It

Stops Ford Chattering

once and for all. Cork Insert Lining never loses its "grip." Never gets hard and glazed. It gives a better driving, surer braking Ford and outlasts two to three sets of ordinary linings.

$3 per Set of 3

No-Slip Fan Belts For Fords

$1.00 for 1917 Fords. .85 for all previous models.

The slip of the ordinary fan belt used with Fords is estimated at 25 to 50 per cent. No wonder the engine overheats! Cork Insert Fan Belts keep the fan turning with the speed of the engine. They always retain their no-slip efficiency. Give exceedingly long service.

DEALERS: Your jobber's salesman will tell you he's selling scads of Cork Inserts. It's repeating, *repeating*, REPEATING. Ford owners are delighted. They say it's the best ever. Enables delivery Fords to pull bigger load. It will pay you to recommend and push Cork Inserts.

Advance Automobile Accessories Corporation, Dept. E 5-1, 56 E. Randolph St., Chicago

Makers also of Cork Insert Brake Linings for all passenger cars and trucks

Light and Power.

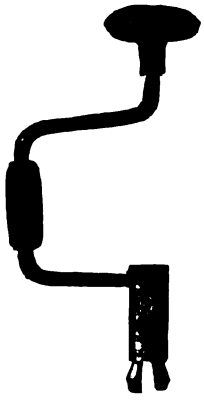
With the shortage of labor that exists at present, the farmer and garageman will be forced to utilize more machinery than ever before and dealers throughout the country should investigate the line of apparatus manufactured by the Western Electric Co., Dept. 721, 195 Broadway, N. Y.

Vulcanizing Shells.

The Williams Foundry & Machine Company, Akron, Ohio, report a brisk demand this season for these shells from

A Vulcanizing Shell.

tire repairmen, as they enable the operator to use his larger sectional molds for vulcanizing repairs on small casings, whenever the small molds are busy.



By fitting a shell into a large mold the size of the mold cavity and the shell are machine-finished to a minute degree of accuracy, the shell is in perfect contact at all points, and as good a cure is secured as by direct contact of tire with mold.

These shells enable the repairman who has various sizes of molds to double the amount of vulcanizing on small size tires at nominal expense.

Utility Rim Wrench.

A device which should be of interest to every automobile repair man as well as every automobile driver is manufactured by the Hill Pump Company, Canal and 23rd Streets, Chicago, Ill., and termed the Utility Universal Rim Wrench.

As the name indicates, the wrench is designed especially for the removing of nuts used in connection with all kinds of demountable rims, but can be utilized for many other purposes. In reality it is a socket wrench set in itself for the jaws adjust themselves automatically. It is designed to be operated with both hands and has the same action as does the carpenter's bit brace, thus giving great leverage and enabling the operator to make considerable speed. When not in use the wrench end folds inside, and the device may be packed in a tool box.

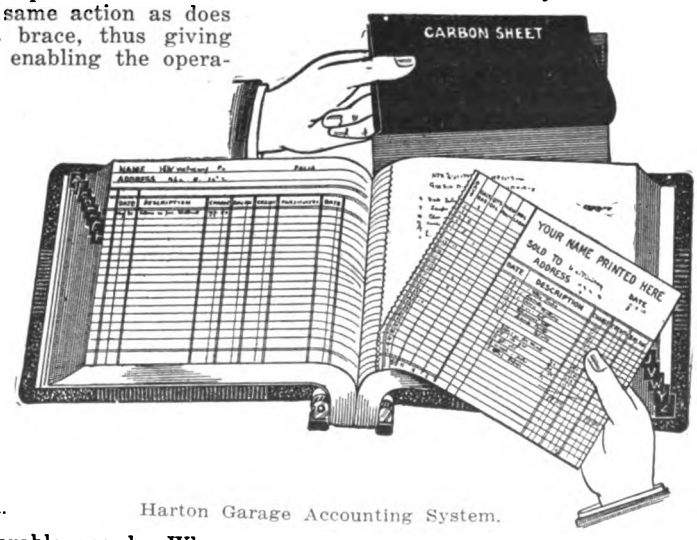
Utility Rim Wrench.

Security Switch Lock.

No car on the market to-day is as popular among thieves as the Ford. The reason is that this car is so easily disposed of. Every car left on the streets is an easy proposition for the thief, unless it is provided with a suitable lock. An ignition lock is of no value if it can be picked or "shorted" out of the circuit, and the New York Coil Co. of 338 Pearl Street, New York, N. Y., claim that their product, the Security lock, cannot be "shorted."

The device consists of an especially strong alloy metal housing that covers the conventional Ford switch and is fastened to the coil box by heavy screws which are covered by projecting bars when the lock is closed.

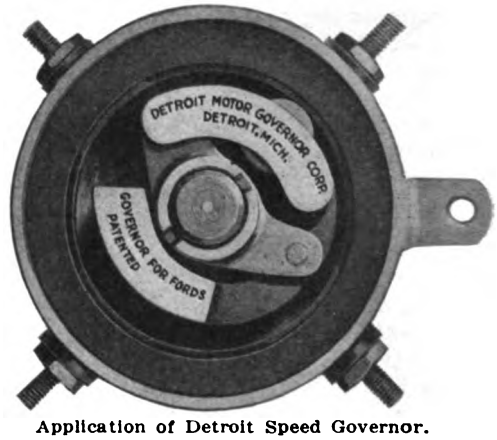
The special feature of the device is the grounding device, contained in the locking mechanism. When the key is removed, a coil spring makes a ground contact with the central member of the switch. And the coil remains inoperative as long as the ground is connected,



Security Switch Lock.

no matter whether auxiliary batteries are used or special wires from the magneto.

Garage Accounting System.



Thomas J. Harton & Co., 212 B Church Street, New York, N. Y., are putting on the market a complete garage accounting system which is said to be complete in every detail and requires but very little attention from the garage man. With this system installed the garage owner may tell at any time just how his business stands yet he is not handicapped by a lot of unnecessary detail work. With this system is furnished complete directions so that anyone without a knowledge of bookkeeping may be able to take up the work and understand it thoroughly.

Harton Garage Accounting System.

Detroit Speed Governor.

There is an ever-increasing need for a simple, reliable method of governing the speed of a Ford engine particularly upon trucks or cars equipped with commercial bodies for the very reason that the drivers entrusted with these machines do not seem to realize that there is a limit to the power of the engine and that to operate the engine above a certain speed with a heavy load results in a rapid depreciation.

Application of Detroit Speed Governor.

The Detroit Motor Governor takes the place of the roller or brush in the Ford engine and is so designed that at moderate speeds contact is made through the timer in the regular way. As the engine speeds up to between 1,400 and 1,600 revolutions per minute, by centrifugal action, the governor breaks the contact and slows the engine down. With the decrease in speed the governor is released again and the engine functions normally. By this means, the full engine power is had for hill-climbing and heavy work, yet the driver is limited to a certain engine speed.

Readers desiring to obtain further details of this device should write to the Detroit Motor Governor Corporation of Detroit, Michigan.

Gasoline Coupon Books.

Few garage men realize that their regular customers purchase gasoline and other supplies at other garages; and there are few accessory salesrooms that control the trade of their regular customers. J. P. Forbes, Forbes Bldg., Coshocton, Ohio, has designed a system, whereby anyone who sells anything pertaining to the automobile, can keep all of the trade of his customers.

Regular customers can be allowed certain discounts on quantity orders, and therefore they may purchase gasoline and automobile supply coupon books, which contain a certain number of tickets redeemable for supplies, at a discount from the regular price. These coupon books may be obtained from J. P. Forbes, in many styles and sizes, all printed and ready for use.

A New Price List on Gasoline Hose.

Interesting because of price reductions shown therein, and rather unique on that account, is a new price list of gasoline hose and couplings just issued by the Metal Hose & Tubing Company of Brooklyn.

It is well printed in two colors and illustrated with half-tone cuts. Anyone can secure a copy if sufficiently interested to write for it.

Digitized by Google

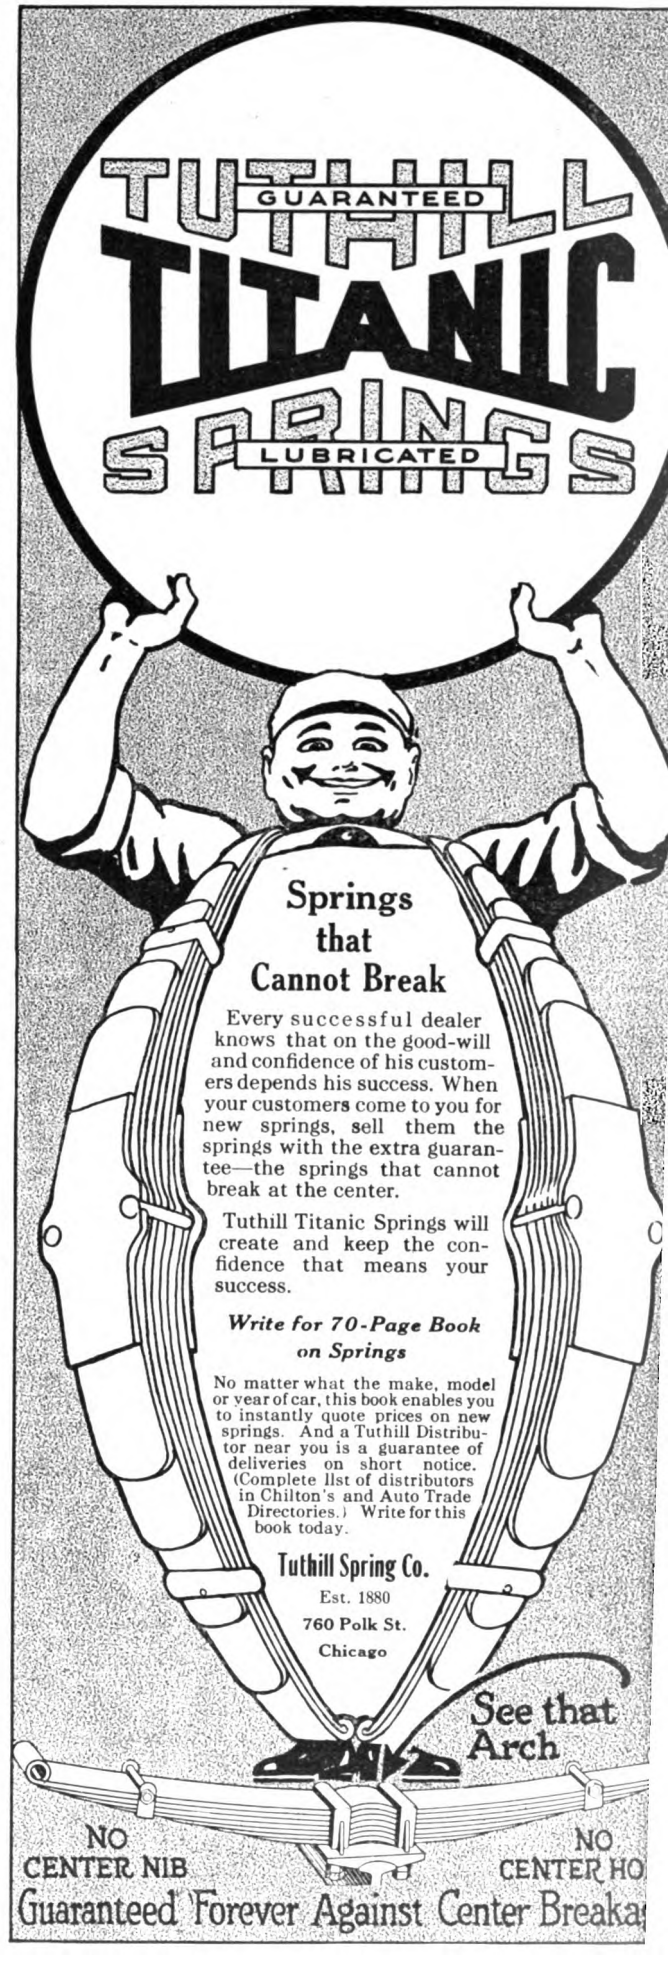
(Continued from Page 67)

I think the cause of the small pieces of carbon in the crank case is due to either the piston rings being too loosely fitted or the use of too light an oil. I have found that every time the compression or explosion passes the rings a certain amount of the burned oil and carbon are deposited on the lower end of the piston wall, and in time it will chip off and drop in the oil in the crank case. I have found the small pieces of carbon in the crank case and think that new rings will prevent their formation.

A Letter for Thos. Seary.

From T. D. Birks, Illinois.—I want to give my opinion for Mr. Thos. Seary's trouble, as stated in question number 2357. I believe his trouble lies in a worn low and reverse bronze disc assembly. The discs are so badly worn that the low and reverse transmission lever passes the center and locks. The reason the reverse will not engage is because the discs are worn too thin. The high speed trouble may be due to the fact that the control rod between the pedal and the high speed lever is too short and won't allow the high speed to engage.

To test for this, put the speed lever in high with the foot pedal released, then press on the foot pedal, noting whether the speed lever moves at the slightest touch. If it does, it indicates that the control rod is too short, and this rod should be lengthened by adjusting the lock nut and control rod, until there is one-eighth inch space between the connecting pin and the rod end (head). If the rod is all right, the high speed bronze discs are worn too thin, and the assembly needs filling out. The noise is caused by play in the front transmission housing, due to the fact that the bushing is badly worn, allowing the gear housings and discs to strike.



The difference between the Brush and Ford cars is that a Brush car uses three sets of clutch discs but no friction drums. The transmission is much harder to adjust than that of a Ford, which has one set of discs for high speed only, the low and reverse being through friction bands and cones.

SECOND ANNUAL TRUCK, TRACTOR AND ACCESSORY EXHIBIT.

The automobile manufacturers as well as those interested in this and kindred fields are looking forward to the second annual exhibit of trucks, tractors and accessories which is to be held upon the Municipal Pier at Chicago, Ill., from September 14 to 21, inclusive.

This exhibit is under the direction of the Automotive and Accessories Exposition, Inc., and was formerly known as the National Exposition for Ford Accessories.

With one exception, all of the officers are well known business men of Chicago. The President, Mr. J. E. Duffield, is the general manager and treasurer of the Bailey Non-Stall Differential Corpn.; the Vice-President, Mr. I. D. Perry, represents the Perry Auto Lock Co; the Second Vice-President, L. P. Zinke, represents the Zinke Co.; Mr. H. S. Irving, the Secretary, is also secretary of the Howe Mfg. Co. B. L. Gray, President of Gray-Heath Co. is acting as Treasurer. H. V. Buelow, of Toledo, Ohio, the general manager, is the only officer from out of the city.

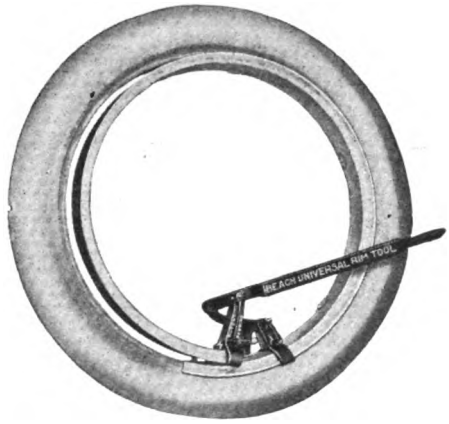
Mellin's Gear Shift Extension.

Many drivers find that they have difficulty in changing gears because of the fact that they have short arms and cannot reach the distance required. To bring the shift within reach, the M. & H. Novelty Co., of 857 E. 24th street, Los Angeles, California, manufacture a handy accessory called the Mellin's gear shift extension. This device, as the name indicates, is an extension bar which may be attached to the gear shift arm of practically any car, bringing the control nearly to the driver's elbow.



National Cash Register System.

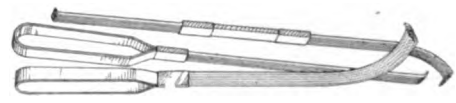
The average garage owner realizes that, with modern competition, he must keep the good-will of the customers. Only by observing eternal vigilance and preventing mistakes is this possible. The National Cash Register Co., of Dayton, Ohio, market a system, in conjunction with their machines, which is particularly applicable to garage and repair shops and is designed to keep the owner in touch with his business as well as to prevent errors.

Beach Universal Rim Tool.

There is a place in the market for a first-class Rim Tool that fits all sizes and types of transversely split rims.

The Beach Universal Rim Tool, manufactured by The Greb Company, 197 State street, Boston, Mass., spreads the rim one-quarter of an inch when it is necessary to do so. It raises one end 2" and carries it over and by the other 4", thereby contracting the rim. The lever swings by center and the spring of the rim holds and locks it in the contracted position so that the tire may be easily removed. After the tire has been repaired and replaced, simply reverse the operation and the rim is forced back to its correct position. It actually contracts and holds the rim, then expands and locks it in its true position in one

Beach Universal Rim Tool.



operation without removing or changing the position of the clamps. Quickly attached and all the hard work is avoided. The tool is built of the best of material and will stand up under the abuse that a tool of this type usually gets. The tool comes folded and packed in a small carton that may easily be stored in the car.

Pipe Tools.

The Greenfield Tap and Die Corporation of Greenfield, Mass., have just published their catalog No. 38, which shows the complete line of pipe tools made by their various divisions throughout the country. In addition to the catalog description of pipe tools, the book contains miscellaneous details of information which might interest the average mechanic. Our readers are requested to write for this, which is free to the trade.

Carbon Scraper.

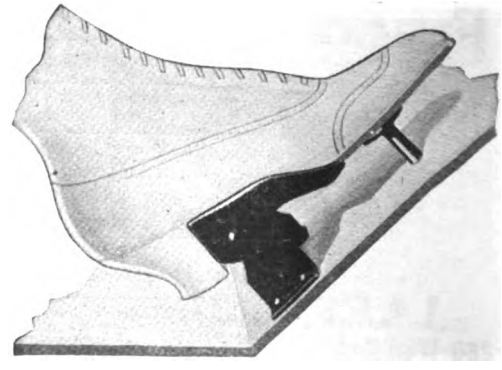
One of the greatest evils that the motorist has to contend with today is the formation of carbon deposits in the engine cylinders. One of the methods of carbon removal is by scraping, and the Flexible Carbon Scraper Company, 1421 West Washington Street, Los Angeles,

Carbon Scraper.

California, are marketing a set of carbon scrapers which are designed to remove carbon formations with a minimum amount of trouble. These scrapers are constructed of flexible material and may be used through spark plug holders or valve cage covers.

New Tire and Tube Factory.

We understand that the Osborne Engineering Co., of Cleveland, Ohio, is drawing plans and specifications for the new factory of the Armstrong Rubber Co., to be located at Garfield, N. J. The present works are at Newark, N. J. This factory will be equipped with the most up-to-date machinery and will have a capacity of 500 tires and 1,000 tubes per day.



The Stenman Electric Grinder.

A device which has recently attracted considerable attention from garage men is known as the Stenman Electric Valve Grinder and is manufactured by the Stenman Electric Grinder Co., Inc., 42 Southbridge street, Worcester, Mass.

The manufacturers claim that with this device valves may be ground in a minimum amount of time. The valve-grinding shaft oscillates at a rate of about 800 per minute. With the machines are furnished two types of valve tools, fitting it to do practically any sort of valve-grinding work.

Accelerator Foot Rest.

One of the drawbacks which comes with the use of the popular foot accelerator is the attendent muscular strain, had from holding the foot against the pedal. The Hayes accelerator foot rest consists of a neat iron device which is

Accelerator Foot Rest.

designed to fit beneath the instep and is mounted on a hinge casting. This arrangement supports the weight of the foot and protects both the heel of the shoe and the floor mat. It is manufactured by the On Guard Auto Necessities Co., of Detroit, Mich.

Cork Insert Brake Lining.

The cork insert principle which has proved so successful in transmission linings and fan belts for Ford cars and introduced by the Advance Automobile Accessories Corporation, 56 East Randolph street, Chicago, has now been applied to brake linings for larger cars.

This product is made of a high-grade heavy fabric into which discs of cork

Cork Insert Brake Lining.

are inserted. These cork inserts have a high co-efficient friction, yet permit the brake drums to slide past without "grabbing." The illustration gives an idea as to how this product appears.

The Orem Motor Protector.

Some engineers have made the statement that 75 per cent. of the carbon found in gasoline engines was really dirt from the road and dust from the air, which in all probability found its way into the engine through the carburetor air intake. If this is true, then the Orem motor protector, made by the Orem Motor Protector Co., of Baltimore, Md., should be of great interest to the users of automobiles. This protector consists of a large sheet metal housing fitted with two flanges, one of which attaches to the carburetor air intake, the other to the hot air stove or left open to the air. Inside the housing is fitted a heavy screen which supports a fine felt filter. All of the air passing into the carburetor is filtered through the felt surface, which may be removed very easily for cleaning. The makers claim that, with the device, there is no danger of clogging, for the dirt is shaken from the felt to the dust pan beneath by the vibration of the machine.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912, OF AUTOMOBILE DEALER AND REPAIRER, published monthly at New York, N. Y., for April 1st, 1918.

STATE of New York } ss.
COUNTY of New York }

Before me, a notary public in and for the State and county aforesaid, personally appeared Frank R. Whitten, who having been duly sworn according to law, deposes and says that he is the business manager of the Automobile Dealer and Repairer, and that the following is to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:
NAME OF—
Publishers—Motor Vehicle Publishing Co., 71-73 Murray St., New York City, N. Y.
Editor—M. T. Richardson, 71 Murray St., New York City, N. Y.
Managing Editor—M. T. Richardson, 71 Murray St., New York City, N. Y.
Business Managers—F. R. Whitten, 41 Pinehurst Ave., New York City, N. Y. M. T. Richardson, 71 Murray St., New York City, N. Y.

2. That the owners are:
Motor Vehicle Publishing Company, 71-73 Murray St., New York City, N. Y.
STOCKHOLDERS—M. T. Richardson, 71 Murray St., New York City, N. Y.
F. R. Whitten, 41 Pinehurst Ave., New York City, N. Y.
A. J. Richardson, Ridgewood, N. J.
Cornelius Doremus, 66 Broadway, New York City, N. Y.
Mrs. J. Howard Girardeau, Jr., Monticello, Fla.
Mrs. Guy Ulmer, Monticello, Fla.
Mrs. Harriet L. Johnston, New Rochelle, N. Y.

3. That the known bondholders, mortgagees and other security holders owning or holding 1 per cent. or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also in cases where the stockholder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear on the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds or other securities than as so stated by him.

MOTOR VEHICLE PUBLISHING CO.,

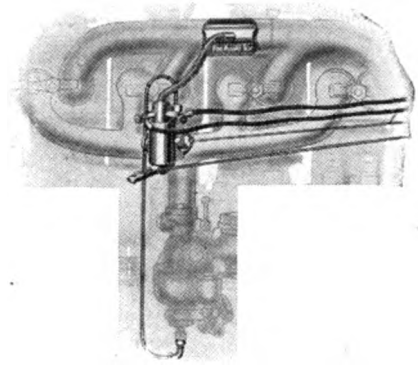
(My commission expires March 30, 1918.)

Marvel Cylinder Reboring Machine.



Garage men throughout the country are beginning to find a big field in cylinder reboring and motorists realize that an engine that has had the cylinders rebored operates nearly as efficiently as it did when new.

A machine designed for reboring cylinders is manufactured by the Marvel Machinery Co., 1301-7 South Third street, Minneapolis, Minn. This machine may be had to operate from engine power and countershaft or by hand and takes up a floor space of approximately 21x60 inches. The boring bar is fitted with three bearings and runs in a split nut. The boring bar is 37½ inches in length and takes care of cylinders up to 13½ inches.

Six cutter heads are provided with each machine, having a cutting capacity of from 2 3/16 to 8 inches in diameter. The face plate measures 12x18 inches and has 43 threaded holes for use in clamping the cylinders in place. Practically any size cylinder may be rebored with this machine.

Perfection 5-In-One Vitalizer.

Two facts regarding carburetion have recently been promulgated by engineers. First, the application of heat to the fuel or fuel mixture, and second, the introduction of moisture with the gas vapor,

Perfection 5-In-One Vitalizer.

have a tendency to cut down gas consumption and eliminate carbon deposits in the engine. A device manufactured by the International Motor Products Co., 2023 S. Michigan avenue, Chicago, Ill., called the Perfection 5-In-One Vitalizer, is designed along the above lines, and consists of an electrical heating unit, for heating the mixture for starting; a priming device; a hot air stove; a mixture moistening connection; and an accelerator. The manufacturers claim that with the device installed a cold engine can be started very quickly, and that there is more power, more mileage, and less carbon.

Anthony Demountable Wheels.

An accessory of general utility has been put on the market which should be of great interest to the Ford car owner and is manufactured by J. P. Gorman Co., 47 West 42nd street, New York. It is termed the Anthony Demountable Wheel and is designed to take the place of the present Ford wheel flange, utilizing the old Ford wheel. With the new device installed, a tire change is made simply by removing three nuts on the new wheel flange, taking off the wheel and putting a spare wheel in place. The complete outfit consists of four wheel changes with inside flanges, an extra Ford wheel, spare wheel carrier and a socket wrench.

Lally Commercial Bodies.

An interesting line of bodies for commercial cars is put out by the Griffin Mfg. Co., agents of the Lally Commercial Body Co., 113 State street, Boston, Mass.

Due to their growing favor in the trade the agents are now ready to license manufacturers in various parts of the country at a small fee, enabling them to make any of the 12 Lally specialties.

Brake Lining for FORDS is profitable to sell

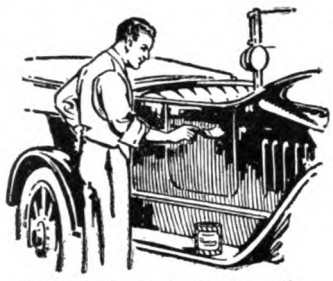
It is made of the best long staple cotton interwoven into a close compact mass and then impregnated with special compounds. After a hardening and frictioning process, the lining is ready to meet Heat, Oil, and Grit. The hot, oily condition found in the Ford Planetary Transmission cannot harm it.

SCANDINAVIA has been the accepted lining for FORDS for many years:

IT WILL NOT CHATTER OR GLAZE

IT IS WEAR-PROOF

OIL AND HEAT CANNOT HURT IT



"AS EFFICIENT AS AN AIR-BRAKE"

Quick to dry and easy to apply. Any car owner can do it.

FOR DULL LOOKING SHODDY CARS!

WHEN the finish of a car becomes dull or shoddy looking, **it doesn't always follow that the car requires an expensive repainting job.**

Nine times out of ten all it needs is a refinishing coat of Panvar.

Panvar is a **transparent,** enameling lacque that gives to any color car a lasting lustrous finish such as it had when it left the factory.

Unlike varnish, however, Panvar is self-leveling, and as quick flowing as water. This explains why it is so easy to apply and why it never shows brush marks or streaks. This one feature alone has revolutionized a lot of old time ideas about refinishing, and overcomes the big objection car owners have to refinishing their cars themselves.

Unlike varnish, too, Panvar dries hard within eight hours; just apply at night and the car is ready for use in the morning.

Garagemen can make big profits by refinishing customers' cars over night. Results are sure and the work is easy.

Retail Prices

Quart . . .	*$1.50*
Gallon	*5.00*

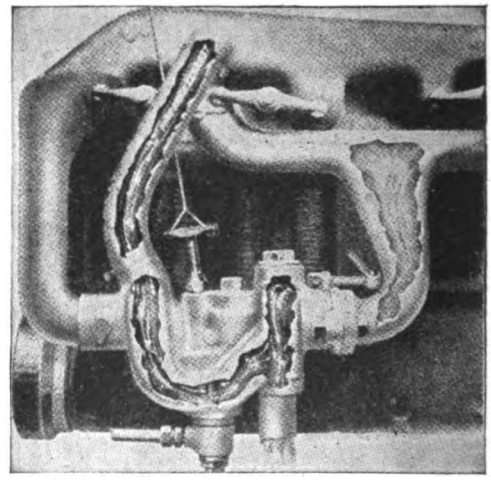
FORD DEALERS



—FOR— YOUR ATTENTION AND ACTION

THIS Firestone Ford Circulator is the first centrifugal water circulator built for Ford cars, tractors or trucks. It's a perfect cooler and a cool motor means a big oil saving. This circulator pays for itself in a short time on this saving alone. Spin your engine for hours. Then put your hand on the radiator. That's the proof. Here then is a ready seller. Demonstrate it to Ford owners. They will see its value and buy it. Price, ready to install—$9 F. O. B. Chicago—your commission liberal.

HERE is the Firestone Manifold—a complete unit, to be attached to any car. Fifteen per cent more power, 25% less gasoline guaranteed. Easily installed. This manifold, by its peculiar construction has heat around the inlet manifold and so it is that fuel is delivered to the cylinder in a highly super-heated condition. Every unit of power is thereby utilized for fuel of even inferior grades. Here's a big seller. Every Ford owner who wants more speed, power and economy is a live prospect for you. Price, ready to install—$7.50 F. O. B. Chicago—Good profit in every sale.

INTRODUCING the Gelson-Firestone Carburetor, a master-worker in matters of simplified principle and design. Will burn kerosene (coal oil) distillate or gasoline without any readjustment. We assert, and you can prove that this carburetor actually burns kerosene better than other types burn gasoline—You can sell Ford Owners on an assurance of 31 miles per gallon. Prices: For gasoline $18.00—For kerosene, with extra tank and water circulator, $30.00. Splendid discounts.

War demands prompt us to sincerely urge you to anticipate your demands and place your orders as far in advance as possible to insure your having a RAJAH stock on hand.

Rajah Spark Plugs
again prove their supremacy

The world's record on a macadam track has just been won by BARNEY OLDFIELD *with* RAJAH PLUGS

On the same track, on the same day Tommie Milton won the Washington Sweepstakes with Rajah Plugs.

The record of Rajah Plugs in all big racing events in the past is being repeated today. It is the performance of Rajahs, under the severest of tests, that proves their superiority for the every-day needs of car owners.

Sell the Plug that has demonstrated its dependability. That's the way to build up trade and hold it. If you have no Rajahs in stock, your jobber can supply you.

KROM-NIK Anderson Special Ratio Gears for Ford Cars

4.2 to 1

greatest possible gear reduction

Price $12.00

4.2 to 1 Ratio Guaranteed Rolled Gears

20 Per Cent More Power for Ford Cars

You can add 20 per cent more power to Ford cars by installing Krom-Nik-Anderson Special 4.2 to 1 ratio gears. The cost is low—$12.00 retail.

The actual cost is more than saved in the first year, for the cost of maintenance and upkeep is greatly lowered by this device. The 4.2 to 1 ratio offered in the Krom-Nik gears is the lowest gear reduction possible in a Ford axle.

In hilly country, on hard going, the Krom-Nik gives greater power and efficiency. Its special type of tooth, an exclusive Krom-Nik feature, offers a better surface than the standard tooth, accomplishing work impossible with the standard gear.

Special Racing Gear 3 to 1 Ratio $12.00

Manufacturers, wholesale and commercial houses that use Ford cars for deliveries report that Krom-Nik gears outwear from two to five sets of the ordinary gears. They solve the rear axle problem. Price $12.00. Easy to install.

There are profits to be earned in your territory from the sale of Krom-Nik-Anderson 4.2 to 1 ratio special gears.

Every Ford owner is a prospect. The price is low—$12.00 retail, with liberal discount to dealers.

Try out this gear. Send for a Krom-Nik. Try it. Guaranteed. Money back if not entirely satisfied. If your jobber cannot supply you, order direct. Use the coupon.

KROM-NIK GEAR COMPANY, 808 Grant Park Bldg., Chicago, Ill.

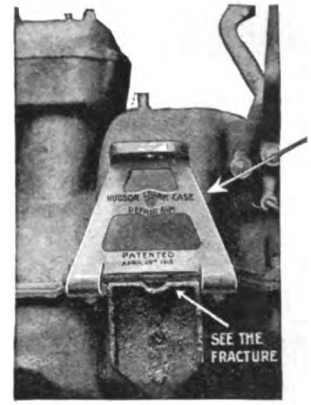
HUDSON

CRANK CASE REPAIR ARM

$1.50 F. O. B. Philadelphia

HUDSON Crank Case Repair Arms are as necessary to garagemen, repairmen and Ford owners as watches are to railroad men. To repair broken Ford crank cases the slow old way is like telling time by the sun—It's inconvenient and more complicated.

The photographs tell the Hudson story. They tell how time, money and labor are saved by the use of this repair device.



It is not necessary to take the engine out of the chassis—it's just a matter of unloosening three bolts, slipping the Hudson Arm into place and tightening them up again to make a perfect repair—requiring less than a half hour to do a half day's job.

Every repairman should have Hudson Repair Arms for making crank case repairs and a stock to sell Ford owners. Get them from your jobber—if his name is not listed, write us direct.

Jobbers: Here's a rapid and a profitable seller. It is one that you can sell to practically all your customers. Write us at once for discounts.

It is patented—
beware of infringers

IS IT WORTH A 3 CENT POSTAGE STAMP?

For any automobile dealer, repair man, garage owner or car owner to receive this useful and instructive magazine, the AUTOMOBILE DEALER AND REPAIRER.

THREE MONTHS FREE

This is our introductory offer to non-subscribers only

In nine cases out of ten, when an intelligent man owning an automobile, or connected with the automobile trade, receives a few copies of this publication, he is so much pleased and impressed that he is willing and glad to become a regular paid subscriber at one dollar per year, and of course that is our chief object in making this offer.

Thousands of readers will testify to the fact that a subscription to the AUTOMOBILE DEALER AND REPAIRER is a good investment and many have told us that they have derived benefit from reading our publication, which was worth to them many times the nominal subscription price.

Here are a few of many unsolicited testimonials which are constantly coming in to us from all parts of the country.

TESTIMONIALS

From LEADER TIRE SHOP, Ohio.
"The value of the Automobile Dealer and Repairer to all connected with the operating, repairing and general upkeep of automobiles, general repairs, etc., can be summed up in one word, "'Invaluable.'"

From T. B. WELLER, Washington.
"I consider your magazine (Automobile Dealer and Repairer) the most interesting and instructive of several motor books I read, especially the "Trouble Department," which has solved a number of very perplexing problems for me."

From R. G. MATTHEWS, Georgia.
"I have seen a number of publications in this line, and want to congratulate you on getting out the very best of them all. Indeed, no others compare with the Automobile Dealer and Repairer. One can get from it more information at less cost than from any other source I know."

From C. S. ADAM, Washington.
"I wish to compliment you on the fine journal you are maintaining. Each number of the Automobile Dealer and Repairer is worth the price of a year's subscription to any man who operates a car. It is surprising to find so many who are constantly in trouble with their cars but will not let go of a dollar for a journal that will save them many times its cost."

From GEORGE O. SMITH, Illinois.
"I take several automobile papers, but find yours is always in the lead. I would subscribe to the Automobile Dealer and Repairer, if you raised the rate to $3.00 per year, as it would be worth the money. I don't see how I could get along without it."
Another enthusiastic subscriber says he would not be without the Automobile Dealer and Repairer if it cost $15.00 per year.

From FRANK BLUM, Ohio.
"Your paper is better on operating and repairing a car than all the other papers combined that I am taking. Your "Trouble Department" alone is worth more than the subscription price."

FROM F. A. BURGER, California.
"It (Automobile Dealer and Repairer) certainly contains more valuable information for the general repair man than any other motor car journal I have ever read, and I surely subscribe to a "flock" of them."

From E. E. CLARK, North Carolina.
"I have had your magazine for a year and will not do without it as long as I can get it. I always look at the Trouble Department the first thing. If a man has an automobile he can afford to pay ten dollars a year for the information he will get out of your magazine, if he cannot get it for less."

If you are not a subscriber to this journal, you may enjoy the advantages of this introductory offer, by filling out the coupon in right hand lower corner of this page, with your name and full address, giving your street and number or post office box number.

Just fill out the coupon before you forget it—slip it into an envelope and address the envelope to the Motor Vehicle Publishing Company, 71-73 Murray Street, New York City, and mail it in.

The result will be that you will receive a magazine replete with valuable information in regard to the care and repair of your car, or if you are in the trade you will receive a great many interesting and valuable hints on repair work and methods of conducting your business.

If you are already a subscriber to our magazine, please see that the coupon on this page is used for one of your friends. Either request a friend of yours to fill out the coupon and send it in to us or fill it out yourself, with the understanding that you are anxious to have your friend receive our magazine, because you feel that he will surely like it and appreciate its usefulness and merit.

You couldn't make a better present to any friend who owns a car or who is interested in the automobile business than this three months trial of the AUTOMOBILE DEALER AND REPAIRER, and when you come to think it over, we feel sure you will agree with us.

We cannot guarantee that the coupon will ever be repeated in future issues of our magazine, so cut it out and have it filled out and send in to us NOW, before you forget it.

Model F—Special for Ford, Metz and Saxon Four - - $6

F. O. B. Newburgh

POWER, PEP AND PUNCH BEYOND YOUR FONDEST DREAMS

NEARLY every Sunderman Carburetor that ever left our factory was put on a motor to replace an instrument that was failing to give satisfaction.

That's an unbelievably hard job for any carburetor—some of our competitors believe it is impossible.

Yet our business has been built on replacement trade alone! Cars of every make, of every model, cars that were discouraging their owners because of motor inefficiency—have been equipped with Sunderman Carburetors within the last two years, and the result is almost universal satisfaction.

We have thousands of letters that have come to us unsolicited from enthusiastic, satisfied buyers of Sunderman Carburetors.

They tell a story, collectively, that we wouldn't dare print without this documentary support.

We have frequently printed letters of this character in the advertising pages of this magazine. We are preparing another such advertisement.

But the Story Is Always the Same.

The message they carry is always the same—*always* the same. Gasoline economy from 30 to 50%—some of them show an even greater saving.

Mileage increased proportionately; speed beyond the motor's original capacity. Power never before experienced. Acceleration as swift, flexibility as great as claimed by the makers of the wonderful eight and twelve-cylinder motors. Hill-climbing ability, economical idling, fast get-away, speedy pick-up, less gearshifting—our customers say over their own signatures that the Sunderman Carburetor gives them all—gives Power, Pep and Punch beyond their fondest dreams.

Prove It Yourself

Submit these statements to any test you can conceive. Buy one of our carburetors today. Mail us your order and let this great instrument begin at once to make good for you. Tell us the make and model of your car—and let us give you special factory service in calibrating a carburetor for your particular requirements. But do it now—before our annual spring freshet of orders starts.

DEALERS: We have been advertising with the utmost regularity and consistency now for over two years in a wide list of motoring papers, until the Sunderman Carburetor is one of the best-known carburetors in the industry.

We have done this advertising to support your efforts in our behalf.

For what you have done we thank you. For what you will do this year, let the profits that come from this advertising drive be your reward.

But get busy. We don't want to sell a single carburetor in your town except through you. We want you to have the profits in return for your selling effort.

There are a great many towns even yet where we can place dealerships.

Write and ask us for our proposition

The Ring that makes the Motor Sing —Why?

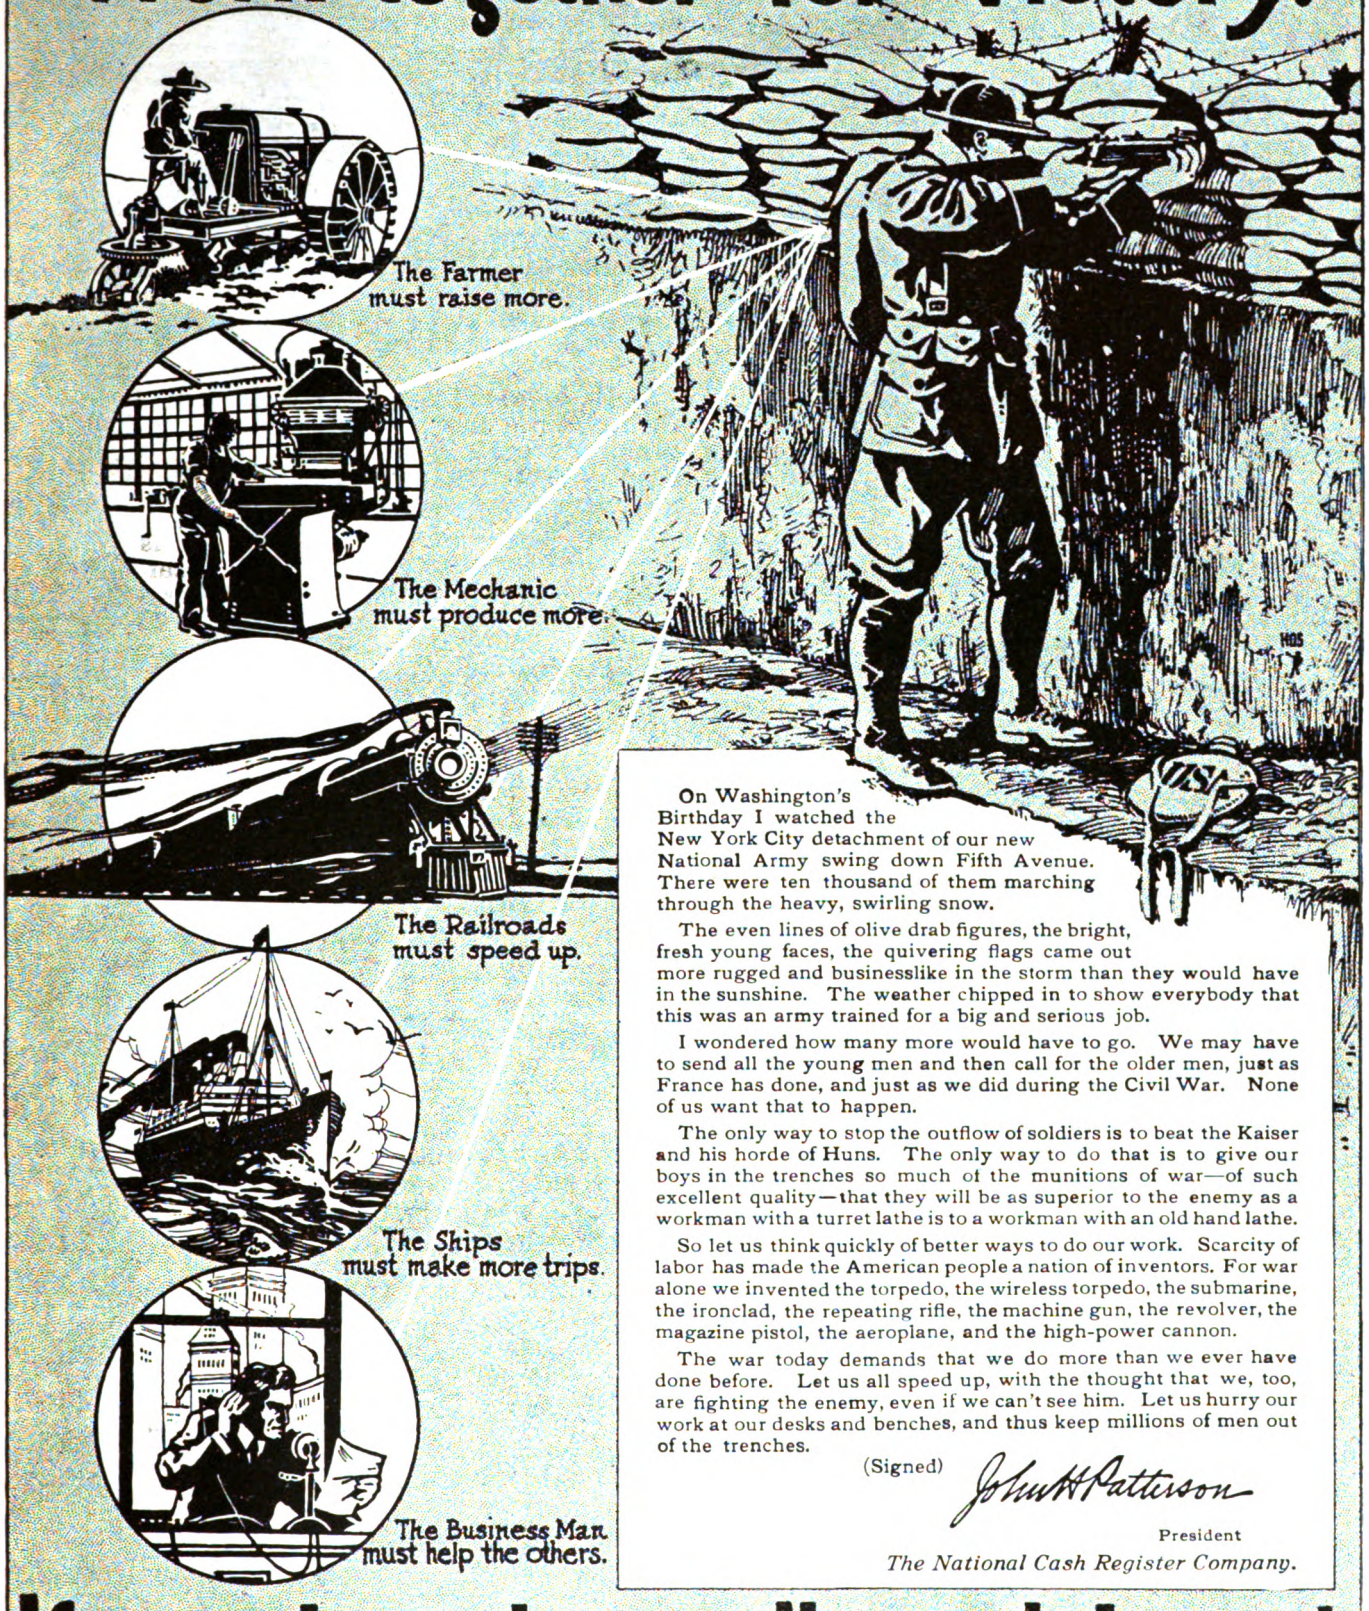
CAR owners who have had Hi-Comp Piston Rings installed are amazed at the results of these magic rings. Engine troubles due to carbon have ended—knocking, skipping, faulty ignition loss of power, high gasoline and oil consumption.

HI-COMP PISTON RING

are not new on the market, but are made by an old established piston ring company from 2 perfectly balanced eccentric rings into one absolutely power-proof concentric ring that forms a gas-tight seal against the cylinder walls *all ways*, always.

Hi-Comps are made from secret process gray iron, ground and polished under oil—not buffeted—to preserve the *true* temper and insure its great durability. The fact that they don't wear cylinders out of round proves their equal radial expansion. Make reboring of average cylinders unnecessary—an exclusive Hi-Comp feature.

Install them in your customers' cars. They will make their engines *sing* a tune that tells of NEW POWER, NEW LIFE, INCREASED EFFICIENCY and bigger savings in gasoline and oil over every other gas-tight ring. Leaky piston rings waste as high as 1 drop of gasoline every 4—Hi-Comps deliver every atom of power from every drop of gasoline. Write *now* for booklet, specification chart and details of liberal 90 day trial guarantee.



Continental Piston Ring Company

Work together for victory.

On Washington's Birthday I watched the New York City detachment of our new National Army swing down Fifth Avenue. There were ten thousand of them marching through the heavy, swirling snow.

The even lines of olive drab figures, the bright, fresh young faces, the quivering flags came out more rugged and businesslike in the storm than they would have in the sunshine. The weather chipped in to show everybody that this was an army trained for a big and serious job.

I wondered how many more would have to go. We may have to send all the young men and then call for the older men, just as France has done, and just as we did during the Civil War. None of us want that to happen.

The only way to stop the outflow of soldiers is to beat the Kaiser and his horde of Huns. The only way to do that is to give our boys in the trenches so much of the munitions of war—of such excellent quality—that they will be as superior to the enemy as a workman with a turret lathe is to a workman with an old hand lathe.

So let us think quickly of better ways to do our work. Scarcity of labor has made the American people a nation of inventors. For war alone we invented the torpedo, the wireless torpedo, the submarine, the ironclad, the repeating rifle, the machine gun, the revolver, the magazine pistol, the aeroplane, and the high-power cannon.

The war today demands that we do more than we ever have done before. Let us all speed up, with the thought that we, too, are fighting the enemy, even if we can't see him. Let us hurry our work at our desks and benches, and thus keep millions of men out of the trenches.

(Signed) John H. Patterson

Bespeaking Patience

It has become necessary to advise prospective purchasers of the Weston Model 280 Garage Testing Instrument, that deliveries can no longer be made promptly. Under present war conditions, there are unusual requirements which must receive our consideration in advance of commercial orders.

For this reason, we can accept your order only on the basis of delivery when possible. We suggest that you place it as early as you can.

Appreciating fully the needs of our customers and that the radical superiority of the Weston Model 280 Garage Testing Instrument is now well known to the Garage and Service Station men, we promise to execute orders in the order of their receipt and as quickly as conditions will permit.

We are confident that this frank explanation of the situation will be accepted by prospective purchasers in the co-operative spirit in which it is submitted.

EMERGENCY AXLE STUBS FOR FORD CARS AND OTHER CARS

Emergency Axle No. 1

Emergency Axle No. 2

Emergency Axle No. 3

These devices are for bringing in cars with broken axles. With either type of axle, a car can be placed on its own wheels within a few minutes time.

The No. 1 and No. 2 axles require an extra front Ford wheel and cones, while the No. 3 uses the rear wheel and has a compression grease cup to prevent it from getting hot.

Nos. 1 and 3 are for Ford Cars.

No. 2 is for all other makes of cars.

List Prices: No. 1, $5.00; No. 2, $10.00; No. 3, $6.00

PORTABLE WORK BENCH & ENGINE STAND

Portable Work Bench

It is provided with two large trays, 22x24, for convenience, where the workman can place his tools, motor, and axle parts. The stand is mounted on three 4-inch diameter wheels. The rear castor wheel is so constructed that by pulling the plunger jim, the castor will swing up off of the floor and the stand will then rest firmly on its legs. By kicking the castor lever down, the stand will go back on its wheels and lock automatically.

A Ford assembly can by fastened to the stand the same as with our Motor Stand.

The Work Bench is also equipped with a machinist's vise, which has a 3-inch jaw with a 4-inch opening, which will handle any work required in overhauling a Ford motor or axle, also other kinds of work.

The Work Bench & Engine Stand is 36 inches high, 27x42 inches floor space.

Weight, 120 lbs. **List Price, $40.00**

MOTOR STAND

The handiest device of its kind for use in shops and garages doing Ford engine work. The Ford motor when taken from a car can be fastened to the stand by the two cap screws which screw into the side of the motor where water inlet connection is fastened. The stand is so constructed that the part screwed to the motor will revolve in the clamp on the stand and can be locked by tightening the lock-screw which will hold the motor in any position or angle desired to suit the workman. It also has a tool tray where the workman can place his wrenches or parts of the motor, if so desired. It is mounted on wheels so it can be moved from place to place. It is 34 inches high; 32x30 inches floor space.

Weight, 50 pounds.

List Price, $20.00

Motor Stand

Model K Grease Gun

Axle Attachment

AXLE ATTACHMENT

The attachment is for use on either our Portable Work Bench & Engine Stand or our Motor Stand.

By merely bolting this Attachment to the revolving part of the stands, it quickly converts them into axle repairing stands for repairing nearly all makes of automobile axles.

Weight, 9 pounds. **List Price, $6.00**

Axle Attachment

PORTABLE GARAGE GREASE GUN

Consists of a heavy seamless steel cylinder mounted on wheels, has five feet of hose attached to bottom of cylinder, with shut-off valve and nozzle at end of hose.

Register measures accurately the amount of grease put in the gear case or differential, and will work equally as well on liquid oil as on hard grease.

It is equipped with two sets of gears. When the crank is pushed in, it disengages the low gear and immediately engages the high gear which operates the piston either up or down at a high speed. To shift back into low speed, merely pull plunger and pull crank outward which engages the low speed gears.

The cylinder is 20 inches long by 6 inches in diameter, capacity 20 pounds of grease or 2½ gallons oil. The piston is covered with best quality cup shaped leather and is provided with an expansion ring in piston which prevents any grease or oil from leaking by. The piston also has an automatic air vent which releases the vacuum in the cylinder when cranking the piston up for refilling. The base is provided with a step-lock which lifts the castor up off of the floor and sets the gun rigidly while cranking.

To operate: Pull plunger and push crank in which engages quick return gears, turn crank to left until piston comes up out of cylinder, then pull plunger and swing head over to one side. Fill the cylinder with grease or oil, swing head back over cylinder, turn crank to right while high speed gears are engaged until piston reaches the grease in cylinder. Then pull plunger over crank shaft, pull crank outward, which will engage low speed gears, then set register by pushing down indicator to zero, then turn crank until you have the amount of grease desired. The register will show the exact amount of grease put in the gear case. The register can be reset at any time desired by pushing the indicator rod down to zero. When grease is used it registers in pounds and when oil is used it registers in pints. The same register is used for grease and oil.

Model K provided with a set of quick return gears and can be refilled in one minute.

Weight, 100 pounds. **List Price, $47.50**

A PATCH

That Will Not Loosen, Leak Creep or Blow Out!

20th CENTURY
Self-Vulcanizing Patch

Makes Permanent Repairs Instantly, and Without the Use of Heat or Tools

It is a three-ply Patch, using a ply of raw Red Rubber next to the inner tube, which guarantees a quick, smooth job of vulcanizing; then a ply of semi-cured rubber next to the khaki cloth. This rubber is not affected by the heat and will not melt, making our Patch absolutely **Leak-Proof;** then comes the ply of best grade khaki cloth, which gives the Patch its strength and durability.

This Construction Makes a Patch We Guarantee Not to Loosen, Leak, Creep or Blow Out, and to Give Satisfaction in Every Respect.

Leak-Proof

Made in 4 sizes	2¼ x 16— 36 Square Inches	$0.50
	4 x 15— 60 Square Inches	.75
	6 x 18—108 Square Inches	1.50
	7 x 75—525 Square Inches (Garage Size)	4.00

If you want a Patch, call for a "20th CENTURY." We make all kinds of Patches, all Sizes and Prices.

JEWELL BATTERY GAUGE

The manufacturer of your car warns you to watch your battery by testing at least twice a month.

Do you do it? Very few car owners do, with the result of poor battery service and often ruined batteries.

The JEWELL Battery Gauge tells the condition of your battery ***all the time,*** as plainly as your speedometer tells the speed of your car, and relieves you of the trouble and inconvenience of messy hydrometer tests.

The cost is Six Dollars—its value inestimable.

If your dealer is a dead one, write us and we will mail you one upon receipt of price.

Dealers Note. We offer you the best selling and most practical accessory ever put on a car.

WRITE TODAY FOR DETAILS.

NATIONAL PRESTIGE

of National Rubber Tire Filler was won through exceptional performance in forever eliminating the bugaboo of auto pleasure—punctures and blowouts.

Made of Pure Rubber, cut in small particles treated, moulded and vulcanized by our special steam process. Fits all the different size casings. No inner tube and air used, eliminating the cause of all tire trouble. Stops the expense of buying, repairing and replacing the inner tubes. Doubles the life of the casing—reducing the cost one-half. Can be transferred and re-transferred as often as is necessary. Has been sold throughout the U. S. and many of the Foreign countries for six years. Has years of actual service record back of it. It has all the easy riding qualities of the air-filled tire, with none of its faults and uncertainties. No waiting to use your car; it is always ready whenever you need it. Let us send you small sample and tell you more about it.

PROTEX GAUGE

Is an Infringement of

MARTIN GAUGE COMPANY'S PATENT No. 1,220,272

On April 24, 1918, Judge A. L. Sanborn, of the United States District Court in Chicago, handed down a decision in our suit against the Protex Manufacturing Company, Charles Friedlander & Co. and Albert E. Pollock, holding that the Protex gauge is an infringement of all of the claims of our patent No. 1,220,272, awarding us an injunction against all of these concerns and individuals, and an accounting of profits and damages with costs.

This was notwithstanding the fact that the Protex Company has had a patent issued first.

We wish to warn the trade against handling the Protex gauge, as any one so doing is liable for an action for infringement.

CRANE PULLERS

No. O
Two Arm Puller

Removes All Kinds of Small Parts Easily and Quickly

For the removal of timing gears, magneto and pump shaft gears—all small work, in fact, that is designed to be removed by stud-bolts screwed in tapped holes in the web, in addition to the regular functions of the ordinary puller—no device is comparable in efficiency and simplicity to the new

No. O
TWO ARM PULLER

The forked stud-bolts, shown attached to the hook end of the arm with pins, are furnished blank and can be drilled and tapped by the user for the proper thread of his work. Case-hardened headless set screws can be used for the stud.

This puller takes light work 5 inches in diameter and 3 inches from the end of shaft. It has the new patent Locking Arms, forked stud-bolts and case-hardened screw.

"Is Ford making his chassis out of rubber, Al?"

"I'll bite—what's the merry come back?"

"No! No! I'm serious. Look at that Ford delivery rig. It's as long as a freight car. Someone has gone and stretched it at least a yard."

"Say, defective eyesight will keep you out of the trenches. Is that the first Hay-Dee Extension Ford you've seen? Hundreds of them are working in New York."

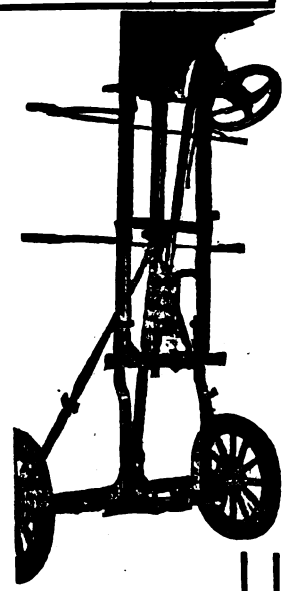
"Just what is a Hay-Dee Extension?"

"Hayes-Diefenderfer massage a Ford chassis until it has a 130-inch wheel base—their method is so ingenious that not a hole or a cut is made on the Ford frame and the chassis has actually been strengthened. Then they mount a body from 90 to 118 inches of loading space back of driver's seat and a Rolls Royce finish and sell the whole job under $900."

"That doesn't include the Ford, does it?"

"It certainly does. If you own a Ford chassis, they will allow you full price of a new one on the deal."

"All their prices are subject to change in 10 days without notice."



"Great Scott! that's the kind of an outfit I need. Quick! lead me to it before I wake up."

Hay-Dee Extensions

can be attached by anyone, with a wrench.

Eliminates the overhang and the frame is strong as ever.

SAVE 60% WHEN YOU RUN YOUR FORD

Use Kerosene

THE Kerosene Equipment, a simple mechanical device, makes cheap kerosene (Coal Oil) the most satisfactory and economical fuel for Ford cars. Every Ford owner has been waiting for it. It means freedom from high priced gasoline. *Drive your car twice as many miles and buy your fuel for less than half.* Think of the saving!

The Kerosene Equipment is the only genuine carburetor of its kind on the market. It is the result of patient, painstaking experiment. But it's ready for you *now*—the greatest money saving invention of the motor world! Fuel that costs half as much, carries you twice as far.

Improves Engine Operation

Besides its tremendous saving in fuel cost, the Kerosene Equipment actually improves the operation of your engine—consumes the carbon; avoids carbon deposits; throttles down smoothly; idles without loading; reduces speed changing.

You are paying out the full purchase price of the Kerosene Equipment every few months and are enjoying none of its benefits Stop the waste of money! You owe it to yourself. Keep half your fuel money in your pocket. Double your present mileage with every gallon. Order an equipment immediately at the present price. *Our guarantee gives full protection.* Our Company has ample capitalization to back every claim. Get the Equipment. You can install it yourself in 30 minutes. Then prove it out *It must satisfy you.* Or your money is returned without question.

THE RED ROAD BOOK

288 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania		Virginia
New York	Maryland		West Virginia
New Jersey	Delaware		District of Columbia
North Carolina	South Carolina	Georgia	Florida

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 203 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of May.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar Address:

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together He is built for heavy work and rough usage at big hotels He's informed on everything but the time table" on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about those parts and the hotels

LATIN-AMERICAN EDITION, 50c—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket Lists the principal cities, principal hotels, and points of interest in United States and Canada only

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the Pocket Edition at 50 cents, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:
MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.
3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD and PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 illustrations and 279 pages on **Electric Ignition, Electric Starters and Generators**, etc.

51 pages and 254 illustrations on **Adjustments, Tests**, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.

27 pages and 180 illustrations on Tires and Tire Repairing.

44 pages and 119 illustrations on Carburetion.

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. **Index begins on colored paper, easy to refer to.**

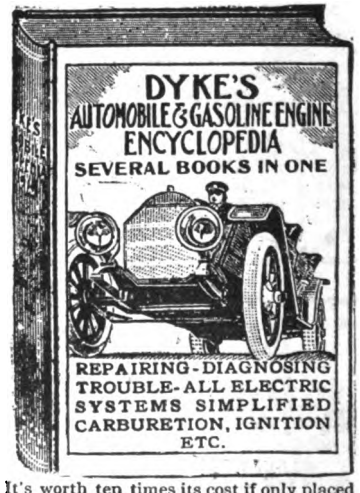
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

***You will like this book*, in fact we will guarantee you would not sell it for three times its cost if you could not get another.**

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

GET ANOTHER 5000 MILES OUT OF YOUR OLD TIRES
Stop throwing away your money!

Save your old tires; for they mean dollars and cents to you. It makes no difference whether they are sand blistered, punctured, rim cut or blown out, McDaniel will put them back on the job.

Simply send your old tires prepaid to the address below, with your name and address attached. When the tires are received at the McDaniel plant they are carefully examined by experts and all necessary repairs are made. The better cover is telescoped over the other one, then the bead is cut from the outer tire and both are firmly locked together by the SPECIAL McDANIEL DOUBLE TREAD PROCESS. Your old tires are now made into one good tire ready to give you thousands of miles extra service.

DO IT NOW—Send us your worn out tires by prepaid express today and save this extra money.

BIG TIRE PROFITS

FOR DEALERS WHO SELL

KIMBALL TIRES

Read This, Mr. Dealer:—

Don't you want to make some real tire money? Then stop handling a few high priced tires that sell slowly and tie up your capital. Meet the cut-rate tire dealers on their own ground. Sell new clean firsts at the prices others get for seconds. Do a big business and turn over your capital several times a year.

KIMBALL TIRES are built to meet the demand for *good* low priced tires. Big dealers in New York, Chicago and other large cities are making more money on this kind of tires than they can make on high priced goods. Why don't you do the same?

You can't compete with the factory branches, distributors and preferred dealers on high priced tires. You can't compete with the mail-order and cut-rate houses on seconds. SELL KIMBALL TIRES and you can beat them both.

There is room for a live KIMBALL dealer in every city and town in the United States. We allow only one dealer in each territory to sell KIMBALL TIRES. Many exclusive KIMBALL dealers are now doing a big business but there is still choice territory to be had. But it is going fast.

Get in touch with us. Send sample order at once. We guarantee our tires to be new firsts and will refund your money if tires are returned in five days in the condition in which they were received. Don't delay.

THE PRICES SPEAK FOR THEMSELVES

	Non-Skid	Tubes
30x3	$ 8.25	$1.90

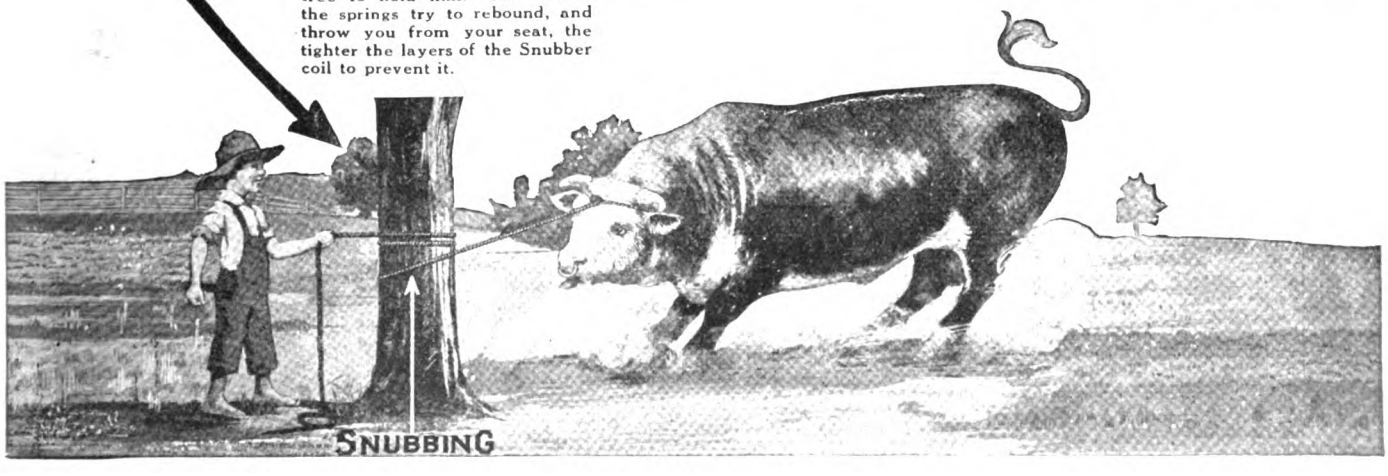
SAVE—

Both your Car and your Comfort by equipping with

GABRIEL SNUBBERS

Make Your Car Ride Easier and Last Longer

$18, $24, $30 per set of four



Follow the example of America's foremost car builders; equip with Snubbers; put an end to abrupt or excessive rebound of the Springs, and you will—

1. Make your car ride remarkably easy and quiet on all roads,
2. Save on tires and springs, by keeping wheels from bouncing
3. Reduce your expense for up-keep and mechanical repairs, and
4. Add a year or two to your car's usefulness.

Let us send you literature, name of nearest dealer and list of standard equipments.

GABRIEL MFG. CO., 1411 East 40th Street, CLEVELAND, OHIO

The harder the Bull pulls, the tighter the rope coils around the tree to hold him. The harder the springs try to rebound, and throw you from your seat, the tighter the layers of the Snubber coil to prevent it.

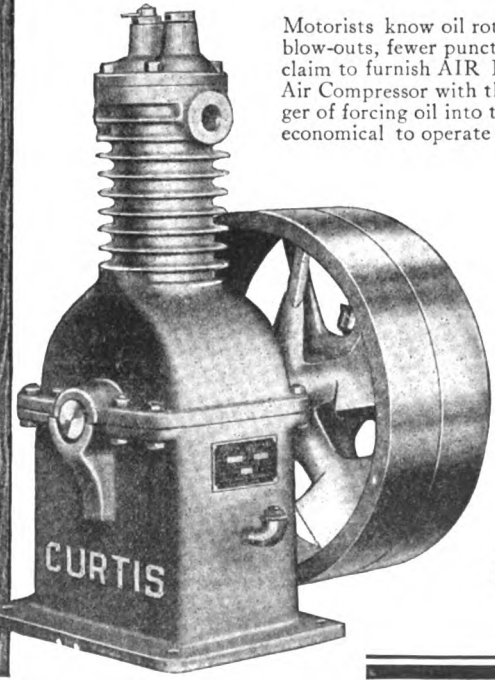
CURTIS ST-LOUIS

FREE
CURTIS-AIR
FREE FROM OIL



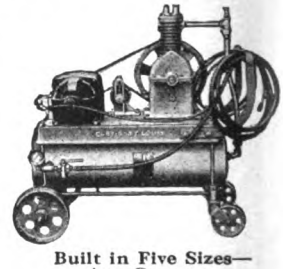
This Sign

carries a slogan known to motorists the country over. It brings them in.

10 x 14 inches—baked enamel on steel—cannot be bought, but furnished FREE with CURTIS Garage Air Compressors—and can be secured in no other way.

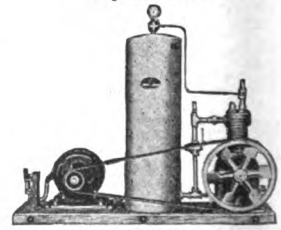
It's a sign of progress—a sign of efficiency—a sign that you are prepared to supply CURTIS AIR—FREE FROM OIL—the kind of Free Air Service the public demands. Get an edge on YOUR competitors—

Install a Curtis Compressor



Motorists know oil rots tires—and that AIR FREE FROM OIL means less blow-outs, fewer punctures, greater tire mileage and less repairs. While others claim to furnish AIR FREE FROM OIL, the CURTIS is the ONLY Garage Air Compressor with the controlled splash oil system, which eliminates all danger of forcing oil into the air line. Reliable, requires practically no attention, economical to operate and guaranteed to stand up under the severest strains.

Exclusive Curtis Features:



Patented controlled splash oil system.
Less oil required. No grease nor oil cups.
Fully enclosed, dust-proof, self-oiling.
Hand unloader permits starting against pressure.
Large fan flywheel keeps compressor cool.
High and low level oil filling gauge.
Valves can't drop into cylinder and wreck machine.
Bearings renewable, adjustable, non-cutting.
Two bearings—crank shaft not overhung.
Fewer parts—reducing maintenance cost.
Easiest to install—no special base required.

5 Sizes—Stationary or Portable

There is a Curtis Compressor to meet the requirements of your business. It will pay you to investigate. Ask your jobber—or write us for particulars and prices.

Built in Five Sizes—Any Current.

Built in Five Sizes—Any Current.

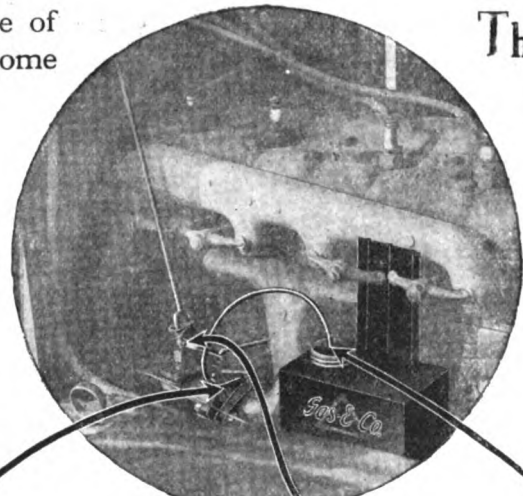
It's Easy To Sell MORE MILES



As a Ford owner, if you saw a sign "More Miles for Sale"—you'd be interested.

More miles per gallon means buying less gasoline.

The Gas-E-Co System is not "just another gas saver." It is the result of 20 years' experience with gas engine construction.

It will give an average of 30% increase in mileage (some users testify to 80%). It develops greater power and more flexibility in the engine, both in high gear and low gear, on hills and levels. It positively eliminates carbon, and keeps it away.

Twenty minutes to install it; no holes, no cutting. Satisfaction on 10 days' trial or money refunded.

COMFORT

1. THE NEEDLE VALVE CONTROL automatically reduces the consumption of gasoline in proportion to the demands on the engine and insures smooth running.

POWER

2. THE VAPORIZER is an auxiliary mixing chamber which automatically maintains the maximum efficiency of the gas at all engine speeds.

RELIABILITY

3. THE DECARBONIZER automatically supplies the engine with the moisture necessary to produce the maximum of power and to totally eliminate carbon.

The Gas-E-Co System For Ford Cars, $10

Shipped by Parcel Post on Receipt of Price

DEALERS

Order a Gas-E-Co System today, put it on your Ford demonstration car — prove it every way yourself. A big business getter because it makes satisfied customers. Profitable offer to those garage owners and dealers who are "keen" after business.

GASOLINE ECONOMY COMPANY, *Sole Owners and Manufacturers of the Gas-E-Co System* **1103 Colonial Trust Bldg., Philadelphia, Pa.**

The Gas-E-Co System is NOT just a bright idea. It is "RIGHT" and is here to stay.

Gas-E-Co COMPANY

Write today for free Book on Gas Economy. It shows we know our business. Books furnished to Gas-E-Co dealers for distribution.

Stop that grease leak!

What every Ford owner wants

You know that grease leaking from the rear axle housing of a Ford, costs the owner money, rots his tires and makes an unsightly mess on the wheel. This grease leak can be stopped effectively with Shurnuff Grease Retainers.

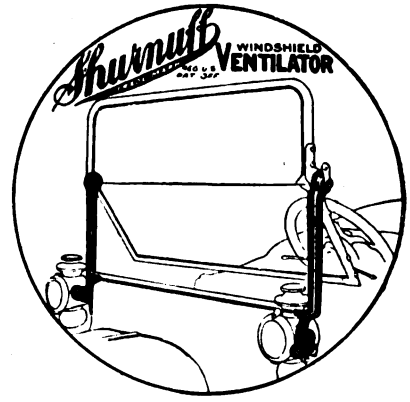
Not an ordinary felt washer which soon needs replacing, but a patented retainer consisting of 3 extra high grade felt washers, 1 rubber asbestos washer, steel cup and retaining rings. When assembled as shown in cut, it is the most effective and lasting way of stopping grease leaks.

A pair costs only 90c. retail. (In Canada, $1.35.)
Ford owners who see them will buy them.

The price is so low and the work they do so important, that you can sell every Ford owner in your section who knows that you have them to sell. Each set is packed in an attractive carton for counter display, and a dozen sets make up a dealer's size case. Order a dozen from your jobber today and find out how fast they sell.

All Shurnuff Ford necessities are sure enough fast sellers. All guaranteed. All packed in attractive cartons for shelf-display. Carried by jobbers everywhere. Write us for special information.

Other Shurnuff Sellers:



Stops sagging of running board, eliminates excessive vibration of front fender, reduces shocks and stabilizes the car. Needed on all Fords. Saves battery from damaging vibration.

Price per pair	$4.50
West of Rockies	4.75
In Canada	6.75

Combines intake and exhaust so that heat from latter dries incoming gasoline and vaporizes it perfectly. Result: smoother running, more power, more miles per gallon, less carbon.

Price	$9.00
West of Rockies	10.00
In Canada	12.50

Gives a Ford all the ventilating features and dust and rain protection of the high priced car. Rainproof at sides, top and bottom. Quickly and easily installed.

Price	$7.50
West of Rockies	7.75
In Canada	11.25

MUNGER "Always Tight" Piston Rings

Ready to insert the Munger Re-grooving Tool to true-up a worn piston groove

The Munger Re-grooving Tool in position for cutting. Testing width of groove with an overwidth ring

Showing how easily Munger "Always Tight" Piston Rings can be placed in the piston grooves with the Munger Ring Insertion Tool

A simple one-piece ring that remains *permanently* gas-tight!
A ring so easy to install that anyone can slip it over the Munger Ring Insertion Tool without breakage or trouble of any kind.
A ring that will give you increased power, greater speed, smoother running, a lower gasoline consumption and an unusual freedom from excess carbon.
By a patent process of peening the Munger "Always Tight" Piston Ring is made to conform to the shape of the cylinder. The Munger "Always Tight" Expansion Joint keeps it compression-tight until completely worn out.
Each outfit of Munger "Always Tight" Piston Rings includes one *overwidth* ring for each piston, to be used in grooves that have become worn. Also a Re-grooving Tool, with which worn grooves can be straightened and trued-up quickly and accurately without even disconnecting the piston from the connecting rod. This avoids expensive lathe work and effects a saving that every car owner and repair man will appreciate.

SHALER Vul-Kit

$3.50

Repairs Casings and Tubes

Every Motorist Needs It!

Every motorist wants to get the maximum mileage from his tires. Now especially—when the cost of new tires is tremendously high—he *needs* and wants just this kind of a tire saver!

For Any Size Tire

The SHALER Vul-Kit fits any size tire—casing or tube. It mends the holes and cuts in the casing that tend to rot the fabric and cause blowouts. Will repair any puncture, tear or cut in the tube. It is simple and easy to operate—anyone can get perfect results without previous experience.

Make Money Selling This Popular Outfit

No new car is supplied with a tire saving device—every car owner should have a SHALER Vul-Kit in his tool box. It is easy to sell—our advertising acquaints motorists everywhere with the SHALER Vul-Kit and they call for it by name. Just let them know that you sell it—and they'll quickly step in and buy it. Every Vul-Kit you sell leaves you a good profit—besides it gives you a continuous profit on the resale of repair material and supplies which the motorist must have—and it brings car owners to your place, who also buy other goods!

Every Jobber Sells It—Ask Yours

Motorists in your vicinity will insist on having the SHALER Vul-Kit. Don't let your competitor make these profits that should come to you. Write your jobber today for prices and dealer selling helps—or order a supply of Vul-Kits NOW so that you can begin making these big extra profits at once.

Catalog of Complete Line of SHALER Vulcanizers for Garages, Repair Shops and Motorists Mailed FREE on Request.

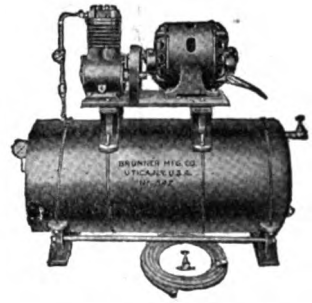
WE USE A BRUNNER AIR COMPRESSOR
FREE AIR
FOR YOUR CONVENIENCE

MR. GARAGEMAN, IF YOU HAVE A BRUNNER AIR COMPRESSOR AND ARE NOT DISPLAYING A BRUNNER SIGN ON YOUR GARAGE TO ADVERTISE THE FACT THAT YOU ARE RENDERING BRUNNER SERVICE, YOU SHOULD SEND FOR A BRUNNER SIGN WITHOUT DELAY.

ADVERTISE YOUR BRUNNER SERVICE AND SECURE YOUR FULL MEASURE OF THE BRUNNERWISE MOTORISTS' PATRONAGE.



"The Motorist who is Brunnerwise knows Brunner Service Satisfies"

Thousands of garagemen have been advertising Brunner Service by means of the Brunner Sign for many years, and Brunner Service has been consistently demonstrating its absolute dependability to thousands of wise motorists for many years, so that these Brunnerwise Motorists always recognize the Brunner Sign as a sure sign of thoroughly efficient and dependable compressed air service wherever they see it.

In this way the great advertising value of the Brunner Sign has been convincingly demonstrated to the garageman in actual service for many years, and the thorough reliability of Brunner Service has been demonstrated to the motorist.

NO GARAGEMAN WITHOUT A BRUNNER AIR COMPRESSOR CAN AFFORD TO OVERLOOK THE SPLENDID OPPORTUNITY OF SECURING THE PATRONAGE OF THE BRUNNERWISE MOTORIST—A BRUNNER AIR COMPRESSOR WILL DO IT.

WHEN YOU BUY A BRUNNER AIR COMPRESSOR

you buy a high grade, practical machine designed and developed for the garageman's use, built in the largest, best equipped exclusive garage air compressor plant in the world, and backed by a responsible organization whose entire time and attention has always been exclusively devoted to the garageman's interests. No attachments necessary to help motor start compressor against full load—No cages necessary to keep valves from falling into cylinder-- No restriction of lubrication to invite trouble—No claims of impossible performances, but—simply the good substantial business proposition it has always been for the garageman.

Write for No. 15 Catalog and name of Brunner Jobber covering your town.

FORMING and TEMPERING

TESTING FOR ACCURACY and ENDURANCE

Resiliency·Endurance·Accuracy

A REPLACEMENT SPRING, to be worth its price must combine three things: Resiliency, Endurance and Accuracy. And of these three Accuracy is the most essential.

A spring must "fit like a glove" if it is to be resilient and durable. It must "fit like a glove" if it is to give satisfactory service.

Your business as a repair man depends on your ability to give satisfaction to customers. Our business depends on your success and patronage.

Knowing this, we have built our business on one policy: Satisfaction to Car Owners—Satisfaction and Profit to Dealers.

The Harvey Process is but a part of the Harvey Policy. Harvey Springs are scientifically made from the best spring steel obtainable. They are so carefully made and so thoroughly tested in design, material and workmanship that Resiliency, Endurance and Accuracy are absolutely assured.

If you are not already selling the Harvey Springs you should get in touch with us at once. It means satisfaction to your customers and profit to you.

There's a Harvey Jobber near you. Drop us a card and we will send you his name and our Spring Book containing specifications etc. of over 900 kinds of springs. Write today, you may need Harvey Help tomorrow.

SUNDERMAN
Vacuum Carburetor

THE supremacy of the Sunderman Carburetor springs from its two simple scientific principles — extra fine break-up of the gasoline particles and the use of multiple jets. The method by which these two principles are combined is the Sunderman idea — and that idea, bringing about perfect carburetion, has brought commercial success.

The Sunderman principle of carburetion is universal—it applies to all makes of cars and styles of engine — passenger car, truck, motor-boat, tractor, stationary and airplane.

It Has Been a Blessing to Ford Owners

It has done wonders for owners of Ford cars. First, it has delivered to them an unexampled, surprising economy. Second, it has furnished more power than Ford owners believed their engines possessed, and it has given their engines a range, a flexibility that has been the chief talking point for the bigger, many-cylindered cars.

ECONOMY — A saving of from 30 to 50% in gasoline consumption follows the installation of a Sunderman on a Ford car. This is not a *claim* — it is a demonstrated fact in many thousands of cases. We have the proofs — which we shall gladly produce at any time.

This saving comes from the more efficient combustion of the gasoline charge, due to the finer vaporization of the fuel particles produced by the Sunderman mixing principle. The finer the particles the more rapid the explosion and the more complete the combustion. The more complete the combustion the greater the power secured from a given amount of gasoline in the charge.

Since a given requirement of power can be produced from a smaller amount of gasoline, it follows unalterably that a saving must result. This saving we conservatively place at 30% to 50%.

POWER — Given its accustomed quantity of gasoline, your Ford (or any car on which the proper model of Sunderman Carburetor is installed) will give a snappy burst of power, an assurance of a power reserve that is a comfort on a hill or in any bad pull.

That confidence in a motor's power reserve is what an owner pays extra thousands for when he buys a car. You can have it in a Ford—equipped with a Sunderman.

FLEXIBILITY — To get out of a crowd quickly — to run from low to high speed with an eager response from your motor — to idle economically, to keep going at a crawling speed in the tangle of traffic — to pick up mightily, competently, resistlessly under a hard pull, a long climb or a heavy load — that spells flexibility, the blue-ribbon quality that has been sought by engine designers since the beginnings of the automobile. An engineer's greatest work is accomplished when he produces a powerful, *flexible* engine. You can have that thrill with a Ford — when it's equipped with a Sunderman.

BUY IT NOW—Don't deny yourself the comfort, convenience and economy that come with the use of a Sunderman Vacuum Carburetor. Put one on your car *now*—don't wait. There's no need. You can install it yourself — easily, according to the simple, positive printed instructions we furnish with every carburetor. It is easy to adjust to your motor. Once properly adjusted, you simply need let it alone — it will work for you and give you a new joy in driving your car. But do it now—it's useless to *want* unless you're willing to *act*. Write us *now*.

Dealers—We want you—we don't want to do business without you. We give you excellent co-operation, splendid advertising support and a good proposition. Ask us for it now.

SUNDERMAN CORPORATION

13 Chambers Street **Newburgh, N. Y.**

Digitized by Google

Price $2.50
F. O. B. Newburgh

To install, simply take off old manifold, replace with the Sunderman manifold, use same bolts, etc., and your job is done.

This special aluminum alloy manifold is equipped with two special features that recommend it to any Ford owner who wants more power or speed, with quicker starting and economy in gasoline consumption.

Gives More Power, Because—

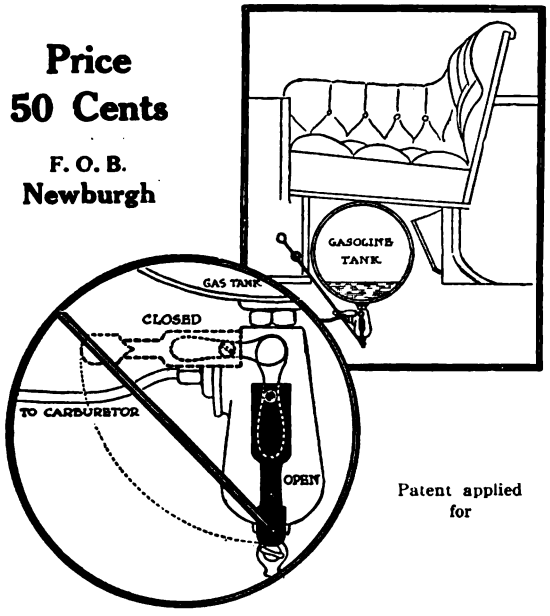
Notice the "bend" in the top center of the manifold illustrated. The ordinary manifold for Fords does not possess that patented feature, and consequently the gasoline being drawn into the motor loses velocity at this point—thus hampering the motor's efficiency.

This "bend" permits the maintenance of a uniform velocity in the flow of gasoline, literally "parting the waves" and thus supplying the motor with gasoline as its needs demand. This in itself is a feature which adds much to both power and speed, and therefore enables the Ford to function with greater efficiency.

Another feature is an interior pocket in the elbow of the manifold, where it turns to meet the carburetor. All gasoline that condenses in the manifold when the motor slows down or stops suddenly is caught in this little pocket or shallow basin, and is ready always to give quick starting—that little extra "snap" and "pep" that mean a fast getaway.

In the ordinary manifold this condensation flows back and puddles in the carburetor, to the detriment of starting and causing frequent choking from a too rich mixture.

"It's in the Bend"



Notice these two features again—the "bend" gives uniform velocity, an absolute essential that is absent from the ordinary manifold. The interior pocket acts as a catch basin for condensed gasoline and enables quick starting.

You need both features—you want the extra power and economy—you get them all in this splendidly designed and manufactured aluminum manifold.

SUNDERMAN

Gasoline Shut-Off for Fords

Price 50 Cents
F. O. B. Newburgh

Patent applied for

A Pull or a Push Does the Work
And it's yours complete for half a dollar

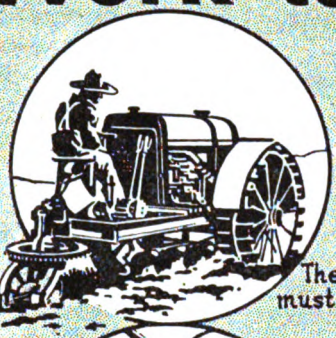
Buy it now—and let this simple but necessary device be ready on your car the next time you need it.

Suppose you want to shut off the gasoline line of your Ford? Ever think of the job it would be? Lift up the floor boards, get your clothes and your hands all messed and dirty—turn off the gasoline petcock, replace the floor board; and then when you want to turn the gasoline on again, go through the same dirty operation. Or perhaps you'd rather get under the car, lie on your back, turn off the gasoline, get out from under, do your job on motor, finish it, and then crawl under again to turn on the gasoline.

The Sunderman Gasoline Shut-Off for Fords does away with all that

Simply bore a hole in the floor board—lift it once only—slip the shut-off device over the handle of the gasoline petcock, tighten the side screw with a twist of your fingers, attach shut-off handle to shut-off with cotter pin, slip it through the floor board—and then forget it forever.

You'll nevermore have to "get out and get under" when you want to shut off your gasoline—for whatever reason, whether you want to stop a leak, drain your carburetor or choke off the nasty flame from a backfire.



All you need do is pull the handle of the Sunderman Gasoline Shut-Off—and it's done! And when you want to turn on the gasoline flow again, simply push it back. It works simply, surely—always.

SUNDERMAN CORPORATION

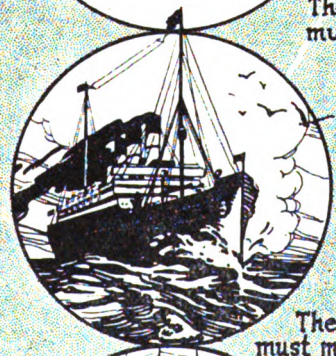
Work together for victory.



The Farmer must raise more.

The Mechanic must produce more.

The Railroads must speed up.

The Ships must make more trips.

The Business Man must help the others.

On Washington's Birthday I watched the New York City detachment of our new National Army swing down Fifth Avenue. There were ten thousand of them marching through the heavy, swirling snow.

The even lines of olive drab figures, the bright, fresh young faces, the quivering flags came out more rugged and businesslike in the storm than they would have in the sunshine. The weather chipped in to show everybody that this was an army trained for a big and serious job.

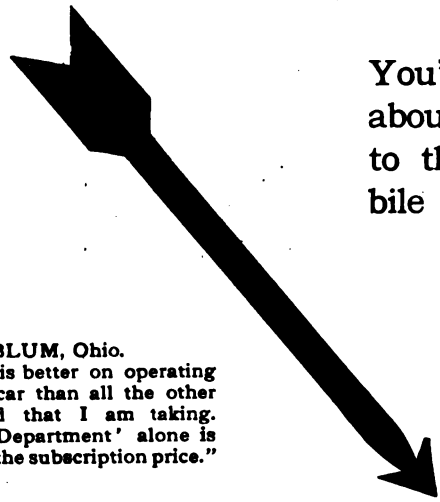
I wondered how many more would have to go. We may have to send all the young men and then call for the older men, just as France has done, and just as we did during the Civil War. None of us want that to happen.

The only way to stop the outflow of soldiers is to beat the Kaiser and his horde of Huns. The only way to do that is to give our boys in the trenches so much of the munitions of war—of such excellent quality—that they will be as superior to the enemy as a workman with a turret lathe is to a workman with an old hand lathe.

So let us think quickly of better ways to do our work. Scarcity of labor has made the American people a nation of inventors. For war alone we invented the torpedo, the wireless torpedo, the submarine, the ironclad, the repeating rifle, the machine gun, the revolver, the magazine pistol, the aeroplane, and the high-power cannon.

The war today demands that we do more than we ever have done before. Let us all speed up, with the thought that we, too, are fighting the enemy, even if we can't see him. Let us hurry our work at our desks and benches, and thus keep millions of men out of the trenches.

(Signed) John H. Patterson



President

The National Cash Register Company.

If one slows down all are delayed.

Why do you allow every Tom, Dick and Harry to tell you how to "fix it"?

You'll get all the information you want about repairing automobiles if you'll turn to the "Trouble Dept." in the Automobile Dealer and Repairer.

FIND OUT FOR YOURSELF!

From FRANK BLUM, Ohio.
"Your paper is better on operating and repairing a car than all the other papers combined that I am taking. Your 'Trouble Department' alone is worth more than the subscription price."

From E. E. CLARK, North Carolina.
"I have had your magazine for a year and will not do without it as long as I can get it. I always look at the 'Trouble Department' the first thing. If a man has an automobile he can afford to pay ten dollars a year for the information he will get out of your magazine, if he cannot get it for less."

From F. A. BURGER, California.
"It (Automobile Dealer and Repairer) certainly contains more valuable information for the general repairman than any other motor car journal I have ever read, and I surely subscribe to a 'flock' of them."

RAJAH

Shipments Are Delayed

Shipments of Rajah Plugs are considerably delayed owing to heavy government requirements placed with the Rajah factory.

In some sections of the country Rajah-Plugs are almost unobtainable. *Don't let this happen to you.*

We strongly urge you to place your orders now, anticipating your requirements as far ahead as possible to insure your having stock on hand.

Rajah Terminals and Adapters
are furnished so that Rajah Plugs can be used with any car.

Rajah Regular and Ferrule Clip Terminals
Adjustable to any cable and with ferrule to fit any cable. With the extra collar supplied both can be used with any make of plug.

Rajah Thumb Nut and Stud Terminals
The Thumb nut is an adapter for Dodge, Ford, Hup, Hudson, Maxwell, Mitchell, Packard Twin Six and Pullman. The Stud for Buick, Chevrolet and Oldsmobile.

Rajah Ball Terminal
Adapter for Franklin, Locomobile and Willys-Knight.

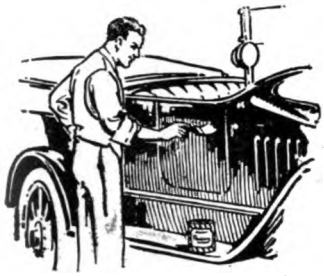
Manufactured by
Rajah Auto Supply Co.
Bloomfield, N. J.
Sales Department
Edward A. Cassidy Co.
280 Madison Ave., New York

The plug that puts power behind the pistons

In speed boats, racing cars and airplanes, Rajah Plugs unfailingly deliver the quick, hot spark that turns gasoline into power.

Records of racing, hill-climbing and flying events, past and present, are indisputable proof of Rajah supremacy.

The automobile owner, who wishes to have available in his car the last ounce of power and be forever free from ignition troubles, should need no stronger endorsement than this.



The reputation of the Rajah is rapidly spreading through our national advertising and through the recommendations of satisfied users. Take advantage of this Rajah demand. It means quick and easy sales.

NOTE—Sell a complete set of Rajah Plugs to every customer. The delightful sense of quick response, increased power and absolute dependability will add to their satisfaction and hold their trade.

SPARK PLUGS

Digitized by Google

Quick to dry and easy to apply. Any car owner can do it.

FOR DULL LOOKING SHODDY CARS!

WHEN the finish of a car becomes dull or shoddy looking, **it doesn't always follow that the car requires an expensive repainting job.**

Nine times out of ten all it needs is a refinishing coat of Panvar.

Panvar is a **transparent,** enameling lacque that gives to any color car a lasting lustrous finish such as it had when it left the factory.

Unlike varnish, Panvar is self-leveling, and quick flowing. This explains why it is so easy to apply and why it never shows brush marks or streaks. This overcomes the big objection car owners had to refinishing their cars themselves.

Unlike varnish, too, Panvar dries hard within eight hours; just apply at night and the car is ready for use in the morning.

Garagemen make big profits refinishing customers' cars over night. Results are sure and the work is easy.

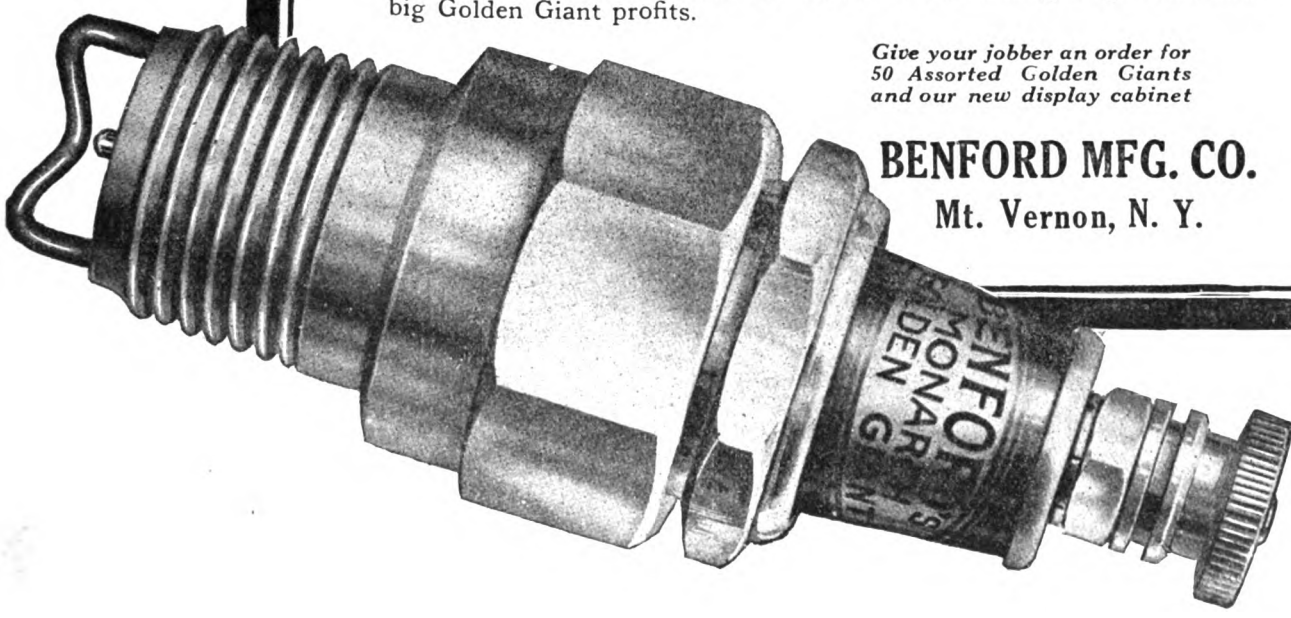
BENFORD'S GOLDEN GIANT

WE have a large corps of salesmen who call on the dealer trade of this country continuously.

Several of them "make" your town three or four times a year.

Use them—they are a fount of good business information. Each man visits 3000 stores a year—every year—and the tips they can give you on sales and display methods and new and better ways of handling business are all as good as cash to you. Submit your problems to them—they will give you interested service that will smooth out many a difficulty.



OF course, they'll sell you Golden Giant spark plugs. They'll set up a window for you, make a show case display, and furnish you with sales information on this masterful plug that will enable you to sell it in competition with cheap plugs every time you start to put over a sale.

Because Golden Giants mean more profit to you—on fast-moving merchandise whose beautiful appearance just melts sales resistance, like snow before the Spring sun.

We plate every Golden Giant with pure gold—it's the only fit way to finish off this splendid plug. It's our promise to ***you*** and ***your customer*** of superior service.

Last year's vast increase in our sales showed how well the plugs made good on our promise. And don't forget—the only reason our business increased was that our dealers were making large sales and big Golden Giant profits.

Give your jobber an order for 50 Assorted Golden Giants and our new display cabinet

"YANKEE" Breast Drill No. 1555

FIVE ADJUSTMENTS—and Two Speeds! make the "YANKEE" Ratchet Breast Drill the handiest tool the garage mechanic can have. Scarcely a drilling job about a car you can't do with it—jobs you wouldn't think of tackling with ordinary drilling tools. No place too cramped; no need to take down construction.

Double Ratchet, for example, keeps drill cutting on both forward and backward movements of crank, no matter how slight: No motion lost; no time wasted. Multiplied Man Power!

Adjustments: (1) Plain Drill; (2) Left-hand Ratchet; (3) Right-hand Ratchet; (4) Double Ratchet; (5) Gears Locked. Both Ratchet and Speed changes made at a finger-touch—without removing drill from work.

"Yankee" Ratchet Breast Drill

No. 1555. Length 17 in. 3-jaw chuck holds round shanks up to ½ inch.

No. 555. Length 17½ in. 2-jaw chuck for both rounds and squares.

Price $8.35

CONNECTICUT

Lighting Switches

are the neatest, simplest and most easily installed equipment of their kind on the market.

Easily operated with a gauntleted hand.

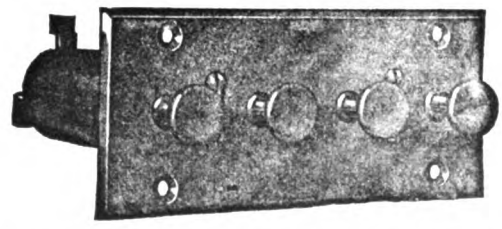
Simple construction insures unending service and satisfaction.

Connecticut switches are designed to provide every arrangement of lighting control that can be desired.

One switch for all lights, individual switches for each, or any choice of functions, individual or in combination.

HEADLIGHTS

The use of resistance for dimming the use of double filament bulbs, or the use of large or small bulbs.



HEAD, SIDE AND TAIL LIGHTS

Head and tail lamps on and off together. Side and tail lamps on and off together.

DASH LAMP

Individually or in conjunction with tail light. These are the principal functions of our standard switches but these by no means indicate the limits of control to which we are confined. Every practical arrangement has its switch.

"NORMA" PRECISION BALL BEARINGS

(PATENTED)

The highest speeds in car or truck—many times the speed in any other part—are carried by the magneto and lighting generator. At high car or truck speed, the speed of these accessories may reach tremendous figures. Is further argument needed, to demonstrate the vital necessity of speedability in ignition and lighting apparatus?

For years past, in America and abroad, in the magnetos and lighting generators invariably identified with cars and trucks of notable dependability, "NORMA" Ball Bearings have been the standard bearings. Their preeminence in this field is the result of an unbroken record of satisfactory performance.

Be Sure—See that your Electrical Accessories are "NORMA" Equipped

REX Automobile Jack

FOR

Garage and Private Service

ENGINEERED TO PERFECTION

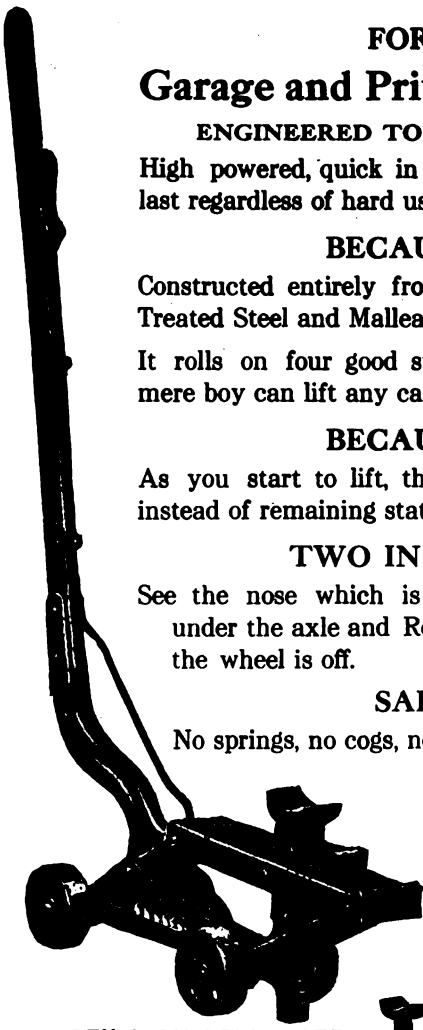
High powered, quick in action and made to last regardless of hard usage.

BECAUSE

Constructed entirely from high grade Heat Treated Steel and Malleable.

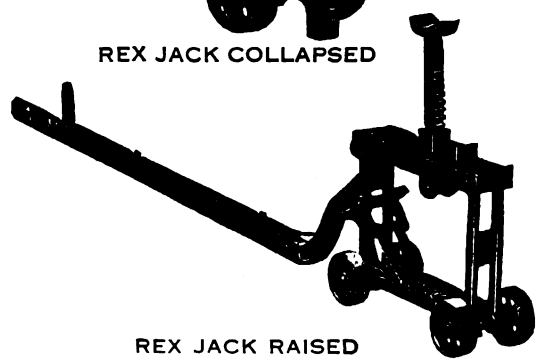
It rolls on four good strong wheels and a mere boy can lift any car.

BECAUSE



As you start to lift, the REX rolls under instead of remaining stationary.

TWO IN ONE



See the nose which is put there to hook under the axle and Rex Jack it up when the wheel is off.

SAFE

No springs, no cogs, no ratchets, but automatically locks at any height thus insuring safety at allheights.

REX JACK COLLAPSED

REX JACK RAISED

Glides under the lowest part of any car even though they be equipped with bumpers or extra tires and raises to a neight of 20½ inches without blocking.

FRIENDS

Thousands in use and not a single complaint but hundreds of compliments.

As a time saver it has no equal and will pay for itself any busy week. Ask any user.

Stocked by your accessory jobber.

Avoid Hidden Wear

Out of Sight—Out of Mind

THE Differentials and Transmissions are out of sight but these gears work hard and require the best possible protection from frictional wear. If you wait until they become noisy you have allowed serious wear already.

The ideal lubricant for these gears is "K00 special" grade of

TRADE MARK REGISTERED IN
NON-FLUID OIL
UNITED STATES PATENT OFFICE

—It follows the gears, cushioning them always from abrasion—but unlike grease it will not melt and run out in summer or thicken in winter.

NON-FLUID OIL is produced from the finest Pennsylvania crude, made adhesive by means of our exclusive process and has none of the non-lubricating fillers used to "body" common grease

Almost every dealer has NON-FLUID OIL in orange cans.
"K00 special" grade for gears;
"K000" for bearings and differentials that are not oil tight.

The New York & New Jersey Lubricant Co.

Guaranteed for 10,000 Miles

EVERY Brictson Tire is sold under a specific 10,000 mile written service guarantee. This guarantee is the longest and strongest ever put behind a pneumatic tire and is a positive protection to every purchaser.

"Absolutely Puncture Proof"

Brictson Tires are puncture proof, and proof against blowouts, skidding, rut wear, rim cuts, and can't be damaged by oil or gasoline. Wonderful resiliency, easy riding qualities as well as economy commend them to every car owner.

The Big One-fourth Retread Feature

Should the tread surface wear out after 10,000 miles of service you can get a new retread for one-fourth the original cost of the tire, instead of buying a new tire, and you keep the remaining three-fourths in your pocket. With ordinary service the Brictson Tire should run enough beyond the 10,000 miles to require one or two extra retreads. The more retreads you use the cheaper your service.

FREE TRIAL OFFER

To convince you the Brictson Tire will give satisfaction TRY THEM ON YOUR CAR AT OUR EXPENSE. Write today for this Free Trial Offer, a copy of our guarantee and full information about Brictson Tires.

2 VALUABLE MACHINES IN 1

Saves Money, Time and Valuable Space, Gives Greater Service and All 'Round Efficiency.

NO business man would buy two motors when one would serve his purpose,—neither would he buy and install a countershaft or hangers, belts and shafting when such action with the attending expense could be avoided.

The U. S. De Luxe Two Stage Combined Compressor and Buffer or Grinder Head not only avoids these expenses but gives new and valuable service not heretofore obtainable. It combines the De Luxe Automatic Air Compressor, which has been sold for years and is now recognized as the best machine obtainable, with a buffer or grinder head of the most approved design. A single motor operates either or both machines.

Motor and compressor are fully enclosed and absolutely protected against dust and dirt from buffer. Compressor or buffer can be operated singly or together while automatic controls prevent overcharging of tank.

A new circular is just off the press which describes the many advantages of this machine in detail.

The UNITED STATES LINE comprises 20 different numbers in TWO-STAGE and SINGLE STAGE TYPES, and various individual equipment adapted for forming combinations of almost unlimited kinds and capacities.

Every garage and tire repair man should write for literature and become familiar with U. S. Air Compressors whether in the market at present or not.

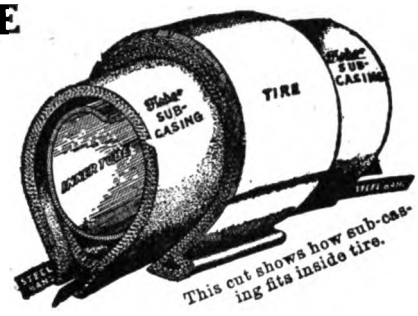
THE Fisher PATENTED "RIM-GRIP" SUB-CASING

MORE MILES PER TIRE
LESS TIRES TO BUY

THE BLOWS THAT YOUR TIRES RECEIVE, WHEN YOU STRIKE OBJECTS IN THE ROAD, LEAVE WEAKENED PLACES IN THE FABRIC.



A TIRE IS AS STRONG AS ITS WEAKEST PLACE

These weakened places are hard to detect now, but will result in blow-outs later.

RIM-GRIP SUB-CASINGS reinforce the fabric of the tire at all points from bead to bead. They make a partially worn tire stronger than it ever was. It can be worn out completely and the sub-casing used in another tire. As the cost of equipping a car with new tires is much greater than last year, it will pay you to investigate Rim-Grip Sub-Casings. *Write for particulars.*

VOL. XXV. No. 4. NEW YORK, JUNE, 1918. PRICE {10c. PER COPY / $1.00 PER YEAR

Picking A Second-Hand Automobile.

Points To Observe, Parts to Examine, and Tests To Make When Preparing to Purchase a Used-Car

IN picking out a second-hand car the buyer should always bear a number of things in mind. The car's age does not make any difference to its value. I do not mean to say, however, that a car built in 1900 is just as valuable as a car built in 1917. Everyone knows that this is absurd. What I do wish to say, however, is that the car might be built in 1900 and be in just as good condition to-day as it was the day it was built.

Age is not the deciding factor. Neither should the number of miles which the car has been run be "chalked-up" against it. The one thing that the value depends upon more than anything else is the way in which the car has been used. At the same time, however, all factors must be taken into consideration. A car might be three years old and never have been run more than a hundred miles. Yet it is perfectly possible that the car to-day is worthless. The owner might have left it out in all sorts of weather. He might have lubricated the clutch with sand. He might have run the tires over sharp rocks. He might have forgotten to lubricate the engine at all.

Care Is An Important Factor.

On the other hand the car might be four years old and even run 50,000 miles. If the owner has taken good care of the machine I will venture to say that the car is in better condition to-day than it was four years ago. If the working parts have been properly attended to and adjusted, if the bearings have received the proper amount of lubrication, then the depreciation has been extremely slight. I once was asked to dispose of an automobile which was three years old. In all cases but one, the persons who came to look at the car with the idea of purchasing it asked two questions. First the age, then the price. The two answers which I gave them were sufficient to enable them to make their decision.

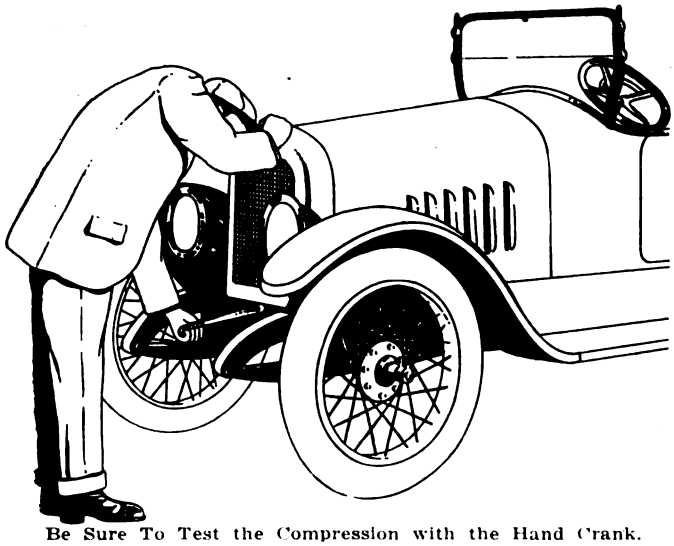
They didn't want the car. It was too old and the price was too high. If the car had been two years old, the prospect would have purchased it. I said that there was one exception and as I remember it he didn't even ask the age of the car. First his question was the price, then he made a very careful inspection and a road test to see if the car was worth the money. He bought it and is satisfied. The point which should be brought out is that when one is purchasing a second-hand car they should not be unduly influenced by the age of the machine. They should make an examination of the car itself and let the examination determine its service value.

If the car has been operated by an experienced automobilist and evn if it is three or four years old, is it not of more service value than a car six months old which has been driven by a person who knows nothing of automobile machinery and he has allowed the machine to rack itself to pieces.

Indexes of Wear.

An automobile is an intricate piece of machinery and one is very apt to be misled by outward appearances. The car body, the upholstery, the top and the mudguards tell a story without words. They are the first indexes to consult. If the body looks as though it had been through a tornado or a battle, the chances are that the mechanism has suffered a like fate, but be not mislead. The car body may be in perfect condition, yet cover an engine or transmission that is nothing more or less than a pile of junk.

A definite method should be used in finding the car valuation, and as space is limited, I will take up only the machine part itself, leaving the examination of the body to the purchaser.



The test or tests may be divided into three parts. First, the careful examination of the units; second, the road test; and last, the efficiency test. One should first examine the engine for it is the heart of the automobile. No matter how good the machine may be otherwise, if the engine is poor the car might just as well be left at home.

Test Compression First.

After being sure that the switch is in the "off" position, the engine compression should be tested. This test is

Digitized by Google

made with the hand crank. The crank should be inserted in the ratchet at its lowest position and lifted slowly. If any of the cylinders are scored or if the compression

Be Sure To Test the Compression with the Hand Crank.

escapes past the valves or the plugs, the operator will find little resistance in lifting the crank. A quick pull of the crank may show considerable compression, but a slow lift shows the true state of affairs. The compression should be springy and while the engine is being tested one should keep his "weather ear" open for the escape of air from the engine.

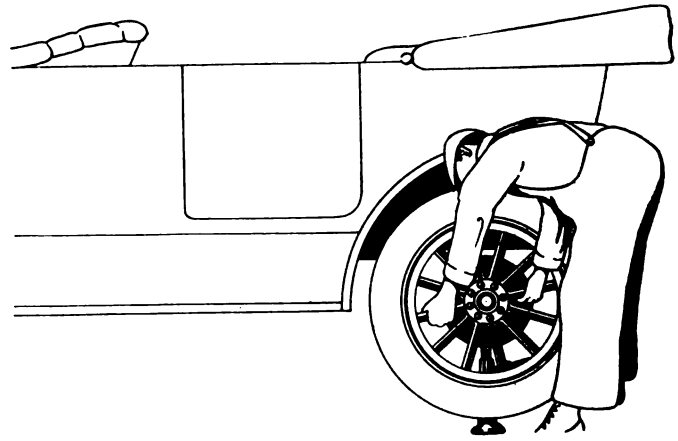
The compression test is the first one to make. It should always be the last as well for if the salesman is dishonest there are a number of ways in which he can increase the compression temporarily. The final compression test should be made after the car has been run five or six miles. If possible, a compression meter should be used in each cylinder. The prospective purchaser should find approximately how many pounds per square inch the engine should show, by comparison with another car of the same make, and be guided accordingly.

Examine Cooling System.

After having made sure that the compression is good, start the engine, and after it has been run for about ten minutes inspect the water in the radiator. If the water boils over or steams, it is a bad indication and a sign that something is wrong. Do not race the engine but endeavor to keep it throttled down as much as possible. Practically every engine on the market to-day can be run at a speed as low as 500 revolutions per minute. If the engine will turn slower than that figure, without missing or backfiring, it is an indication that the compression is good, that the electrical system is functioning properly, and that the carburetor is properly adjusted. It is a much more practical test than operating the engine at excessive speeds.

I have seen salesmen impress a prospective purchaser by racing the engine at speeds from 2,000 to 3,500 revolutions per minute, and will admit that the performance was impressive as well as noisy, but as far as I know the test was as worthless as running the car over a precipice to prove that it had speed.

While the engine is being operated keep one eye on the exhaust. If the exhaust is in the form of a heavy black or blue vapor, the symptoms are bad. They indicate an escape of oil into the cylinders or the excessive consumption of gasoline. Throttle the engine to its lowest speed and open the throttle quickly. The engine should accelerate rapidly without back fire. If the action is sluggish, it indicates carburetor trouble.



Engine Should Not Act Sluggish.

If the engine acts quickly and obeys the throttle, the test is satisfactory. Short-circuit two of the spark plugs and note whether the engine will run on the other two cylinders. In turn, do this to all plugs, being careful, however, not to operate the engine for any length of time on the two cylinders. For the time being, this completes the test of the engine.

Jack up both of the rear wheels and put the transmission gears into neutral. Turn one of the rear wheels in either direction and listen to the gear action in both the rear axle and the transmission. All of the gears should be tested in this way, and should the gears be faulty or improperly adjusted there will be a grind or squeak either in the transmission or the rear axle.

To test the differential gears be sure that the switch is off, engage the high speed gears, throw in the clutch and turn one of the rear wheels. The other rear wheel will turn in the opposite direction, bringing into action the two differential gears in the differential housing. Listen for any undue noise. Remove the jack from under one of the rear wheels and turn the other wheel as before. Have an assistant throw out the clutch and then listen to the action of the rear axle again. This test will indicate any trouble in the master or pinion gears. After this test has been made, have the assistant engage, one at a time, the various speeds in the transmission. Listen to the transmission gear set as each separate set of gears is engaged.

The next test to be applied covers the whole power system. First be sure that the rear wheel is securely supported by a box or heavy blocking so that it will not shake back to the ground or the floor. Then start the engine.

The Rear Wheels Should Be Examined for Lost Motion.

Operate the engine at as low a speed as possible and listen to the power system, the transmission, and the rear axle. Try the various gear ratios and note the clutch action. It

Digitized by Google

is a good time to find if there is excessive friction between the engine and the rear axle. If there is too much friction, the engine will be slowed down when the gears are engaged. Lift the other rear wheel from the ground and try the same experiment with it in this position.

Test the Brakes.

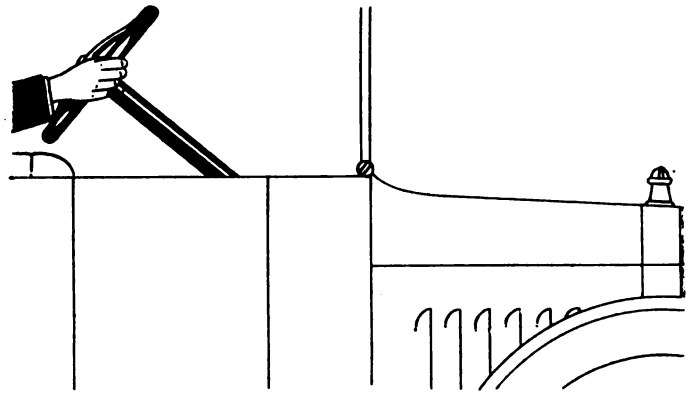
See that both the emergency and service brakes operate smoothly but be careful not to apply them with the clutch engaged. Be sure to note whether there is any lost motion between the engine and the rear wheels. An excessive amount of lost motion will be evidenced by jerky wheel action and is an evidence that the gears do not fit properly with each other. In making the test by hand, this same fact should be noticed and one should not be able to turn the wheels more than one-eighth of a revolution without affecting each other, or the engine when the clutch is engaged.

After having made these tests, remove the blocks and examine the wheel bearings. The wheels both front and rear should have little or no side play. Jack up the front wheels and spin them. See that they run freely and note whether the rims line up correctly. If the tires, to use the slang expression, "'wobble" from side to side, the wheels are out of true. Examine all of the rims and spokes, they should be tight and firmly joined together. Little need be said about the condition of the tires. The tires are another matter and do not add or detract from service value of the car. One should make allowances for tires in the price. Examine the steering mechanism very carefully. This is an important part of the car and should be worn but little.

Between the steering wheel and the front wheels there will probably be a slight amount of lost motion. This amount varies in different gears, but as a rule the steering wheel should turn not more than one-third its circumference before affecting the wheels. This completes what might be termed as the possible examination of the car mechanism.

The Road Test.

The next test to be made may be termed the road test. Measure the gasoline in the tank and note the amount of lubricant in the engine then decide upon a tour of about ten miles over which to run the car. Start the engine and engage the reverse speed. Engage the clutch slightly and see what effect the reverse action has upon the engine. The car should "back" without materially affecting the engine's operation for with the reverse ratio the most power is obtained.



If the reverse operation is satisfactory, engage the low speed gear and run the car two or three hundred feet in low. Listen to the transmission and the rear axle for poorly adjusted gears. Engage the intermediate speed and do the same. Finally try the high speed and note the conditions as before.

If the car is on level ground and is in good condition, it may be throttled as low as five miles per hour. Try this experiment. Then see if the engine picks up so that the car may be speeded to 15 or 20 miles an hour very quickly. Any sluggishness of the engine may be noted immediately. Like the low speed engine test, the low car speed test is more satisfactory than a car speed test of 40 or 50 miles an hour.

Many engines in poor condition can be made to drive a car 50 miles an hour but seldom can be throttled to five miles an hour. Drive the car to a steep hill and at the top stop the engine, allowing the car to coast down the hill.

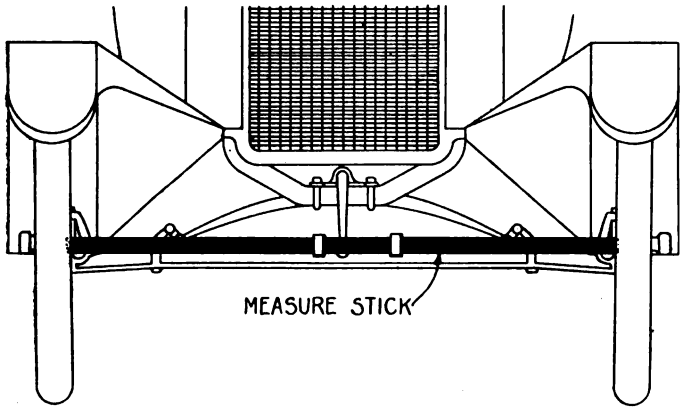
Locating Power Plant Noises.

While the car is coasting, engage the different gears and listen to the transmission. With the engine stopped this test is an excellent one for finding troubles in the

The Steering Wheel Should Not Have an Excess Amount of Lost Motion.

transmission system. It is also an excellent one for locating squeaks and rattles in the body. Bear in mind that body squeaks and rattles must be silenced before one can hear noise from the engine or transmission.

The test of the machine on the road and hills is a matter for comparison only. Before purchasing the car one should compare its operation with other cars of a similar make. The car should be driven over average roads for a distance of at least ten miles. Then the amount of gasoline consumed should be computed and comparisons made with the amount of fuel necessary for cars of a similar size. A car that burns an excessive amount of gasoline is a poor investment unless one is sure that he can eliminate the trouble by the installation of up-to-date devices or parts. After the engine has been returned to the garage, the compression should again be tested and it should be as great if not greater than it was before the beginning of the test. Note whether the water in the radiating system is steaming or boiling. It should be neither.



Examine Storage Battery.

The storage battery should be examined and tested with a hydrometer. After a ten mile run with no lights burning, the specific gravity of the electrolyte should average from 1.275 to 1.300. If possible one should ascertain where the storage battery was charged last and from the battery station man find out just what condition of the battery might be. If the specific gravity of the electrolyte does not indicate a full charge after ten miles of running, one should make sure that the generator is functioning.

To be sure of this fact start the engine and notice

Digitized by Google

whether or not the current indicator or ammeter indicates "charge." Turn on all of the lights and see if the generator furnishes enough current for all of the lights and the ignition system while it is running. Stop the

Measure the Distance Between the Front Wheels, Both at the Front and Back

engine and again notice the ammeter. Be sure that it points to "discharge" while the lights are burning. This test is simply to make sure that the ammeter is not connected with the circuit wrongly, for it would be very possible for a dishonest owner to so arrange the ammeter that it would indicate "charge" when it should indicate "discharge."

In this way one could not be sure that the generator was functioning.

One should inspect all of the units so as to make sure that none of the castings are broken or cracked. Breaks in either the engine or the transmission are apt to be evidenced by excess amounts of oil or grease upon the outside.

Not until after all of these tests have been made can the prospective purchaser get a true idea of the service value of the car. Aside from these tests, the prospect should take into consideration the owner's or driver's attitude in operating the car. If the owner appears to be a careful driver, it is one point in favor of the car. If, on the other hand, the owner is careless and abuses the machine the purchaser should make the examination a very careful one.

EXCESSIVE COMPRESSION.

One Trouble in an Overhauled Gasoline Engine Which May Result in Burned Bearings and Diluted Lubricant.

OCCASIONALLY we receive letters from our readers complaining of excessive carbonization in engine cylinders. In many cases the readers tell us that they have had the engine overhauled recently, the cylinders rebored and new piston rings put in. The general opinion among car owners is that oil leakage into the cylinders is caused by loose fitting pistons or rings. In many cases this is true, but it is not always the case.

Not long ago, the writer visited a service station when a car owner came into the shop and told about his car which had just been overhauled. During the course of the conversation it transpired that he had not been obliged to replace the lubricating oil in the base, or put in new oil for nearly a week, despite the fact that he had been using the car almost continually.

The garage man put on his hat and coat and went to look at the car right away because he knew that something was wrong. Sure enough, there was something wrong or at least there might have been, had the car been run very much further.

The car had just been overhauled, new pistons and new rings had been put in and the cylinders reground. The increased compression forced considerable of the condensed fuel into the base, diluting the cylinder oil and taking the place of that which had been consumed. Consequently it would have been a matter of but a short time when the lubricating oil had become inefficient and caused the bearings to have been burned.

In this particular instance, the fuel had been forced into the base but in many cases lubricating oil is pumped into the cylinders, especially if the intake valves open late, when a vacuum is caused by the cylinders which draws the oil upward into them.

The car owner should be very careful of his engine after it has been overhauled and pay particular attention to the lubricating system, bearing the two facts which we have brought out, in his mind continually.

TRACTOR AND TRUCK EXHIBIT.

Practically All of the Middle West Farmers Are Interested in the Big Chicago Show To Be Held in September.

The Second Annual Exhibit of Tractors, Trucks and Accessories is to be held upon the municipal pier, Chicago, Ill., from September 14 to 21, and bids fair to be the largest of its kind yet staged.

The farming interests look forward to it with great enthusiasm for they hope to see the latest tractor and truck models. The exhibitors welcome this chance to put their products before the public for they realize that in this day of efficiency, everyone is looking for machinery and devices with which they may do more business, raise more produce or increase car mileage.

RADIATOR TESTERS WANTED.

The government is looking for men to test radiators and is putting out a general call for such men as care to learn or work at this branch of the trade. The work consists of locating leaks by immersing the radiators in water and noting the places from which bubbles arise. Any of our readers interested in obtaining a position of this sort should write to Charles E. Mack, 480 Lexington Ave., New York, N. Y., Bureau of Aircraft Production, District Office of Production Department.

How to Place and Distribute Advertising So That It Will Give Results

3—The Kind of Goods To Advertise and the Relation of Turn-Over to the Amount of Advertising Given a Certain Line of Products.

BY FRANK FARRINGTON

MOST of us can remember having seen in small-town newspaper advertisements of the "Hats, Caps, Boots and Shoes" type that covered pretty nearly everything in the advertiser's store, all at one swoop. That kind of advertising never did pay, and it lacks more of paying to-day than it ever lacked before. Competition has made it necessary that advertising bring out some specific thing.

If you were to buy large space in the newspaper and every issue fill it with such statements as this, "Everything in Automobile Supplies, Tires, Oils, Greases, Accessories, Gasoline, Agency for Packard, Ford, Buick and Chalmers Automobiles," your money would produce but a scant return. You would keep your name before the public and they would be reminded that you run a garage, but the advertising would not sell anything. It would not create any demand or encourage the purchase of a single thing you have to sell.

Tell Your Employees They Must Not Leave a Pint of Gasoline in the Hose.

Good advertising means advertising some specific thing and it has two phases. Either you advertise to let people know that you are prepared to supply something they all know about and are interested in using, or you advertise to make people want something, to show them that a certain item or line is desirable for their use.

In advertising to let people know that you sell the thing they are already expecting to buy, you are taking advantage of the manufacturer's publicity or of the habitual use of some one commodity, gasoline, for example, which all motorists have to buy.

If you advertise that you sell something like gasoline, your advertising must emphasize service, or location, or price. The public is already sold on gasoline just as they are sold on sugar. The grocer does not have to advertise sugar because people would buy it anyway. Gasoline is the sugar of the garage trade.

Still, you might find it profitable to advertise gasoline in a certain way, because if you get the best gasoline trade of the town you will be able to make more profit on the gas and you will get the other business of many of the gasoline buyers.

In advertising gasoline, however, you will not tell what gasoline will do. You will tell what you do. You will advertise the fact that your pump is most conveniently located, or that you keep the pump tested so that you are sure of always delivering a full gallon for every gallon indicated on the register. You will advertise that no sediment can get through your pump and that your employes are instructed to use the utmost care in removing caps from gas tanks in order that sand or dust from the car will not get into the tank and perhaps choke the feed pipe.

Honesty Is An Asset.

You will call attention to the fact that in buying gas from your pump, there is no waste. You will state that your employes are instructed never to run over a tank, never to leave a pint or so in the hose, never to overcharge or undermeasure. Thus, you will show the user that even though he can buy his gas by the barrel cheaper than you can sell it, he probably does not save any money by doing so.

So, you see, there is something to advertise even about a thing like gasoline, and it may be made profitable to do that advertising.

In this advertising which is counted on to interest people in buying from your garage things they are going to buy anyway, you will emphasize the advantages of buying things of the particular make that you handle. It will be so in tires. You do not have to ask people to buy tires. You have to ask them to buy the kind of tires you sell. So also with oils and greases.

You may easily find it profitable to advertise well known makes of supplies which pay a smaller profit than some other things for the reason that advertising of such things counts double. It links your garage up with the advertising done by the manufacturer. It brings to you people who have been influenced already by the advertising of the manufacturer. It makes your advertising and his pull together and both will pull the stronger for the co-operation.

Advertising makes goods go faster, makes it possible to turn over your stock more frequently, and on that account it is good business to advertise lines that pay a small profit.

Digitized by Google

The advertising you give unknown or nameless goods must pull harder in order to make sales. You have to convert your public at the outset.

If you have a stock of some device for helping make a Ford car easier to steer and it is not generally advertised

Back Up the Manufacturers' Advertisements with Your Own.

and your public know nothing about it, you have to show them that your device is something they want and need. You will have to educate them into the belief that it will do what you claim for it. You practically have to begin at the beginning. You get no help from the manufacturer because he has not brought the device into prominence.

Tires and gasoline probably sell on closer margin than almost anything else you handle. An off-hand guess would be that it would therefore be less profitable to advertise them than to advertise other goods. That is because the off-hand guess does not take account of rapidity of turnover, caused by the necessity for buying again and again as you sell out frequently.

Familiar Things Easily Sold.

Of course the things that people are using all the while are easier to advertise. It is easier to interest people in reading the advertising literature about them. Good advertising about things you sell every day will bring more business than advertising of the same quality about things you sell only now and then. A man will read tire advertising all the time because he wants tires frequently. He will pay little attention to battery or speedometer advertising after he has bought his new battery or new speedometer. He is out of the market and turns his attention to other things.

Limited Demand Factor.

There are some lines of goods which you cannot afford to advertise very extensively. For example, there are lines you carry, for which there is a very limited demand. The possible sale of these goods, even if all your prospective buyers of them purchased, would be very small. You will be able, if you look around your garage stock room to find items selling for perhaps a dollar each, the sale for which would never get above half a gross a year.

The sale of $72 worth of the goods, at retail, might bring you a gross profit of from $18 to $24. If that half-gross sales should represent just about the "saturation point" of annual sales effort, it is plain enough that it would be foolish to spend ten dollars in advertising that item, because the ten dollars would represent more than the net return on the whole deal. To spend ten dollars in raising the sales of an article enough to increase the net return five or eight dollars would not be good business. So, you see, there are certain items that are not worth much publicity expense, even though they may return a larger profit per sale than some quick-selling items.

Turnover is what makes profits and you will do well to concentrate on the kinds of goods that turn rapidly, in order to speed up the turnover.

To find the number of times your stock turns over in a year, divide the cost of the goods sold, not the aggregate sales, by the inventory value of the average stock. Fast turnover means doing a large business with a small stock, and that means frequent buying—keeping goods coming in all the while as well as going out all the while.

Knowing How Much to Advertise.

Knowing what to advertise involves knowing how much to advertise it. That is to say, many items which are not worth, in point of possible sales and profits, giving them a full advertising space talk, may be worth mentioning in one corner of your advertisement quite often. You can make up a big display advertisement for the newspaper telling about something worth large space, and without reducing the pulling power of that ad, you may use a little space in it to call attention to the little item of limited appeal.

A good many items that are not important enough for newspaper advertising are important enough for such advertising as you can give them in the windows and inside the garage by means of show cards, or through the distribution of folders, or by putting up fence signs along the highway.

One of the things garages do not advertise enough is service. Service is what people expect from you in return for the profit you charge on your goods. When you develop a special means of accommodating the motoring public, don't be too modest about letting the public find it out for themselves. Advertise the fact that you give certain accommodations. If you have free air, say so.

The Prospective Purchaser Must Be Shown—Show Him.

If you have a good rest room in your garage, mention it. If you make deliveries within a certain radius, advertise the fact.

Digitized by Google

This service commodity is not a tangible and a concrete thing perhaps, but it is a thing very much appreciated. It is a thing people want and they are looking for the garage that gives it, and that garage is going to get their trade in actual commodities and it will indirectly reap a good profit on the investment in advertising it.

A part of service, or closely connected with it is the labor in your workshop. Do you ever give up your

Put Thought Into Your Advertisements, Don't Hold Them Until the Last Minute.

advertising space to telling about the technical ability of your working force. Take each man by himself, run his picture in your advertisement, tell what his training has been, just what his specialty is and what work he does. This kind of advertising will work in many ways. It will interest the friends of the workman, it will encourage the man himself, and of course it will interest people who are looking for the best mechanics.

Confidence in a garage is what brings the best class of trade; the trade of the men who own good cars and want them well treated. Patrons who want to be sure that the work they pay for, has been done. Advertise to create confidence in your shop, to make people believe in your honesty.

Labor Is a Commodity.

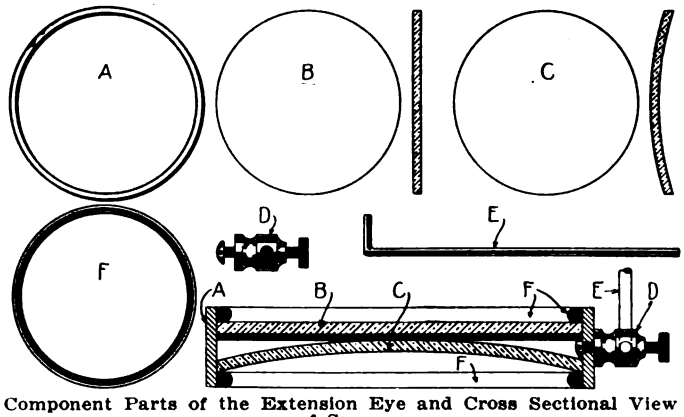
Labor may not bring the same direct profit that tires bring, or that the sale of a car brings, but it brings people back again and again for more work, and work means the sale of parts, accessories and supplies. Advertise the labor you employ and let people know that it is dependable. If you have more work than you can do, advertising may not be desirable, except that it might make it possible for you to pick and choose, eliminating a class of work that does not bring spot cash, or that does not help the general business as much.

When you plan your advertising, don't go about it haphazardly. Give every good feature about your garage its chance. Advertise first one thing, then another, and don't let your advertisements repeat. Go right along down the line on all the items you want to stimulate.

Make out a schedule in advance so that each week you know what to advertise, without having to rack your brain at the last minute for something to mention that time. Get up your advertisements ahead of time. The printer will be a better friend if you are the man who always gets his copy in early, instead of at the very last minute.

You can remember many times when you have sat at your desk, knowing you had to get up an advertisement, but wondering what in Sam Hill you could advertise that time. Advance plans will prevent this brain-racking at the very last minute, and the resulting "half-baked" advertisement.

Many garage men, who forehanded enough with their shop work and buying, are always behind with their advertising, partly because they dread the work and partly because they don't know what to advertise. Give your advertising more thought. Plan it farther ahead. Make it just as much a part of your routine work as making out pay checks. Then you will come to like the work, or at least to do it easily and much more successfully, and you never will be worried over what to advertise.



A HANDY GARAGE TOOL.

A Device That Figuratively Brings All of the Hidden and Inaccessible Parts of An Engine and Transmission Within Reach.

A GARAGEMAN who has been in the business for any length of time usually has some interesting ideas and short cuts for doing work, and it is interesting to go into garages which have repaired automobiles since they first came into use. Not long ago the writer was in such a garage and found a little device which seemed to be mighty interesting. This might be termed an "extension-eye" for the repair man. Manufacturers often jokingly remarked that some time they intend to build an automobile which has all of the small nuts, bolts and screws on the dashboard, and though such a thing is not possible, the repair man who designed the "extension-eye" about which we speak did the next best thing.

An Extension Eye.

This device was nothing more or less than two small mirrors about an inch and a half in diameter, mounted upon a long flexible wire. When the writer visited the garage the repair man was examining the wrist pin of

Component Parts of the Extension Eye and Cross Sectional View of Same.

an old Hupmobile engine. There was no way for the repair man to look directly at the wrist pin because the

Digitized by Google

crank case opened at the side and a mirror was the only answer.

Upon closer examination the device was found to have two different sides, one side so fitted with a plain flat mirror while the other side was fitted with a concave mirror. The construction was simple and the cost but a few cents.

In the accompanying sketch is shown the combining parts and the mirror assembled. In making a device of this sort one should obtain first a large watch crystal, the largest obtainable, and have it silvered at some mirror manufacturer's, or at any small shop where mirror silvering is done. One should then obtain a brass ring or tube slightly larger than the crystal and cut it about an inch in length as shown in A. Around the inside edge of this arm should be soldered a piece of copper or iron wire and the mirror C put into place. In the side of the ring at D should be fastened a binding post, such as is used for electrical apparatus and this binding post should be soldered to the ring. Be sure that it is soldered tightly, or sooner or later it will unscrew from the ring and cause trouble.

With the binding post in place a piece of cardboard should be placed on top of the concave mirror and a flat mirror B may be placed in the ring. The flat mirror may be cut from any ordinary plate mirror with a glass cutter. After this has been put in place the ring F should be sprung into the brass rim. A little careful hammering of the rim bends it over and retains the ring F in place. The handle E should be made from a piece of soft iron wire such as is used for telegraph lines and may be of any length to suit the repair man.

With a device of this sort the interior mechanism of the engine may be examined, the transmission may be looked into and frequently the repair work on the undersides of the units may be done without crawling beneath the car. The concave mirror will magnify parts at the same time that it reflects and comes in very handy for looking at the back of the ignition unit or coil.

Manufacturing Methods, the Care and Repair of Automobile Springs

Those Steel "Shock Absorbers" Which Prevent the Racking of the Car Body and the Passengers Need Constant Attention

BY M. J. HENNESSY, M. E.

SPRINGS are attached to a vehicle so as to impart resiliency thereto, that is what they are primarily intended for, and sometimes they are used for that purpose. Often they are used to make the night hideous with squeaks and groans which I need not try to describe, as you are doubtless quite familiar with them. Again, they are used to loosen all the nuts and bolts in the car and to jar the suffering passenger loose from his thoughts, or anything else he may have, including his money, if he happens to be the one who pays the bills.

A motor car spring is made up of a series of leaves or plates which are set one on top of the other. As long as the surfaces are free from rust or grit, and are lubricated, some way or another one *has* a spring, but when once the rust gets in and acquires a firm footing, then one *had* a spring.

Springs are made from a specially prepared steel, the ingredients of which vary according to the formula of the maker, or with the specifications of the car builder for whom they are being prepared. As the formulae are so many and varied I will not attempt to give an analysis of the stock, but will try to describe the process of making the spring itself.

Making the Spring.

The steel is first cut to the required lengths. It is then shaped on the flat. The top leaf, main leaf or leader, as it is variously called, is the most important. This plate is invariably of a parallel thickness, while the under leaves, or followers, taper toward the ends. The main leaf having been cut to the proper length, is rolled or forged at the ends to form the "eyes," into which are fitted the shackle bolt or shackle bolt bushings, as the case may be. The side view of the main leaf at this stage is shown in Figure 1 at A. In some cases, particularly on trucks, the second leaf is extended and wrapped around the eye of the main leaf as shown in Figure 1 at B. This is what is called the Double Wrapped Eye.

In still other cases, the second and third leaves as

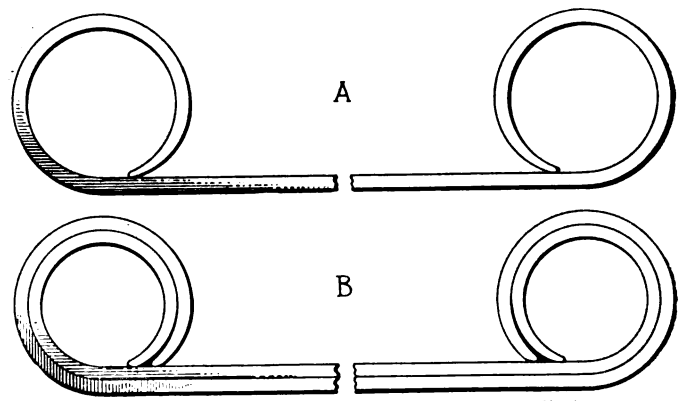


Fig. 1.—Two Steps in the Manufacture of a Spring.

well as the first, have a shackle bolt eye, in each of which is a separate shackle bolt. This is called the Triple eye shackle and is shown in Figure 2. It is, as far as I

Digitized by Google

know, only used on trucks where there are no torsion rods employed. It is used only on the forward end of the rear springs.

The under leaves or followers are now forged out so that they may have the correct thickness tapering from

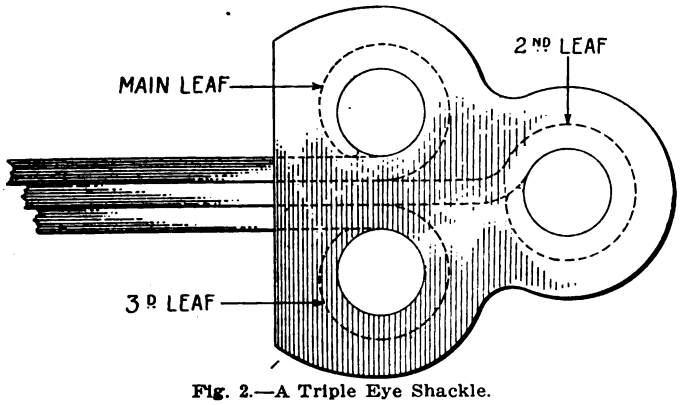

Fig. 2.—A Triple Eye Shackle.

the center toward both ends, then the ends are rounded.

The next operation is the placing of the bolt hole, if the spring is to have a center bolt. As nearly all the work which is done on this kind of steel is done while it is red hot, this hole is put in with a punch. Manufacturers are fast eliminating this method of construction, however, in favor of the dowel and slot arrangement.

Advantage of the Center Bolt.

The only advantage of the center bolt is that it keeps the spring in place on the axle and keeps the leaves lined up. The grave disadvantage of it lies in the fact that it weakens the spring and renders it more liable to breakage. The dowel system accomplishes all the results of the center bolt and has none of its disadvantages. The spring is now ready for its final shape which it receives in the following manner:

A form is provided which has the exact curve required for the new spring. This form is placed on a stand convenient to the forge. Figure 3 gives an idea of the stand and form in general use. The main leaf, which has been heated to a very bright red heat is now laid on the form and pinched down by means of tongs until it lies right on the form, touching at every point. This process is repeated with all the other leaves, each leaf being used as a form for its follower, until the spring is complete.

The spring is now ready for its final tempering, and here again the processes are so diverse and so many that no attempt will be made to describe them. It is sufficient to say that the great majority of manufacturers are continually trying to improve their product and it is no more than fair to say that when one gets a set of American-made springs in his car he has a set of the best springs obtainable and it is well within his power to keep them that way.

Lubrication Is Important.

The first and most important item in spring maintenance are the shackles, shackle bolts and bushings. Everyone who has had any experience with machinery of any kind must realize the importance of having a moving part work easily in its bearing, and yet it is no uncommon thing to see a man take a "young" sledge hammer and drive a shackle bolt home as if it would never need be removed again. Remember in putting these parts together it is just as important to have them work easily and smoothly in their bearings as it is to have oil in the engine.

The bolt should be tight in the shackle but it must be a bearing fit in the spring. A properly fitted spring bolt will feel to the hand about the same as a wrist pin; that is, when the bolt is oiled it should just slide through the bushing; there should be no side play nor should it rock in any direction and the bearing surfaces should be as smooth as they can be made. Before the bolt is put into place it is absolutely necessary to have the three holes in perfect alignment.

If, in order to pass the bolt through shackle and spring, it is necessary to take a four-foot monkey wrench or a huge bending iron and apply a twisting strain to the spring there is something wrong and it is best to find out what the trouble is before going any further. Every man who has attached springs to an automobile knows that the easiest way to do the job is to first attach the spring to the shackles and then fasten the spring to the axles, but in this case the easy way is the wrong way because when the spring clips are pulled down there is no way of telling what one is doing to the shackle bolts and by the time a heavy rear spring has been pulled down to its seat the shackle bolts may be pulled a sixteenth of an inch or more out of parallel.

Use Care in Fitting.

If one wants to get the best results, first set the spring on the axle, examine it carefully and see that it hugs the seat closely and touches at all points. If there is any space showing between the two surfaces don't try to make them fit with a file but insert a piece of leather, the same length as the spring seat, and no wider than the spring. Make a hole in the center, a trifle larger than

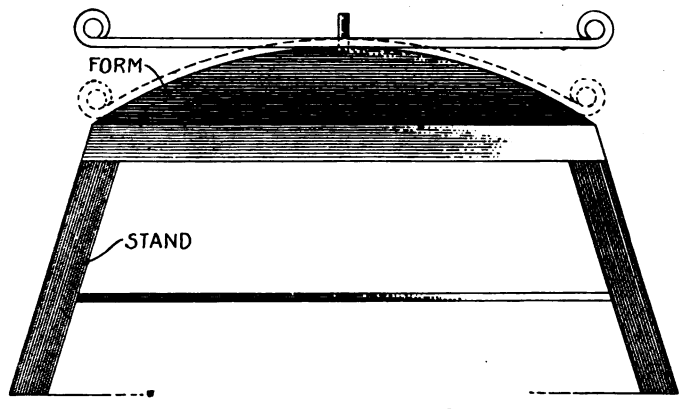

Fig. 3.—The Forming Bench and Forming Iron.

the hole in the spring seat; have the leather thin enough so that the butt of the center bolt, or the knob on the bottom leaf, as the case may be, will project far enough to fit snugly into the hole in the seat.

Unless there is a marked difference in the curves of

Digitized by Google

the seat and the spring a very thin piece of leather will do as well as if it were a half inch thick. Having made sure that there is a perfect seat for the spring you can lighten the work a little by taking two pieces of stock or two bolts which are smaller in diameter than the right bolts, and hang up the spring to the shackles. Then put on the clips and in tightening up spring clips don't be afraid to put a little "beef" to the wrench. *Make them tight.* The spring is now ready for the shackle bolts. Take the stationary one first. At this stage it may be necessary to pry the axle in one direction or another. It is permissible to pry or force the spring in any direction but one—*don't twist it.* A good way to exert pressure on a spring is to take a small heavy "C" clamp, attach it to the spring with the screw toward the ground, pass a bar through the clamp so that the end of the bar will reach the frame of the car, or the spring itself, and in this way one can coax the most stubborn spring into place.

Use Plenty of Oil.

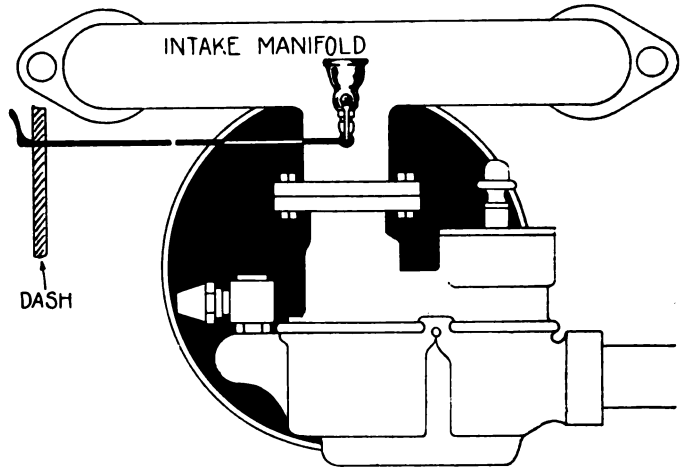
Having lined up the spring in the forward or stationary shackle, oil the bolt thoroughly and slip it into place. Then repeat the process with the rear or swinging shackle. One will seldom, if ever, have any trouble putting in this bolt. It is only necessary to bear down on the spring until the holes line up and the bolt will go right into place. If it appears as though the spring must be twisted to get the bolt in, and the spring has a good solid seat on the axle, the cause is one of two—either the main leaf is twisted or one of the shackles is out of line. The correct line for every shackle bolt is exactly ninety degrees to a line drawn through the center of the chassis. There should be but little difficulty in correcting the trouble if it exists.

Care should also be taken to see that the nut on the shackle bolt is not pulled up so tightly that the shackle pinches the spring. For this reason it is poor policy to use lockwashers on these bolts as a lockwasher to be efficient has to be pulled up so tightly that it is bound to pinch the spring.

It sometimes happens that one who is inexperienced will take all the springs out of a car without noticing just how they came out. When he starts to replace them he notices that the springs have a long and a short end. That is where he begins to scratch his head and wonder. The invariable rule for this type of spring is—the long end to the center of the car; that is, the long end of the front spring to the rear and the long end of the rear spring to the front.

Remove All Rust.

Should you take your car springs apart and find them coated with rust, take a light hammer and beat each leaf lightly until the rust falls off. You might use a ream of emery cloth or sandpaper and not get anything like the results attainable with a couple of hours effort with a hammer. When each leaf is clean and free from rust take a mixture of Dixon's graphite and any kind of slush grease that is handy and coat each leaf thoroughly. The grease is used simply to keep the ghaphite where it belongs. In the opinion of the writer, graphite is the only real spring lubricant and the more of it you can get between your spring leaves the better for the springs and your comfort.



It is not necessary to have the springs out of the car to grease them. One can buy an inexpensive tool which is shaped something like a "C" clamp, having two wedge shaped jaws instead of the conventional flat faces of a clamp. By loosening up the spring clips and inserting this tool between the leaves there will be plenty of room to introduce the lubricant by means of a thin knife or any other means at hand.

Don't try to spread the leaves of a spring without loosening the axle clips and the center bolt, if there is one, and taking some of the weight of the car off the spring by means of a jack under the frame. Do not drive a screwdriver or chisel between the leaves. It is much cheaper to buy a spring leaf separator than it is to buy new springs.

USING AIR AS A FUEL.

Now That Gasoline Is Scarce and Its Price Is Soaring Toward the Skies Efficiency Should Be Our Watchword.

IN these days of high prices the motorist emits a groan every time he reaches for his pocketbook to pay for gasoline, consequently he should be interested in any device for saving fuel.

Petcock Installed In Intake Manifold.

Few motorists realize that the older types of carburetors do not work efficiently with present-day fuels. Consequently some of the fuel escapes combustion and is driven through the manifold. The reason for this is that the fuel is not properly vaporized and mixes with a sufficient quantity of air so that the question immediately comes up, "why not burn air instead of gasoline?"

At low engine speeds a certain amount of air is required in proportion to the gasoline but as the engine speed increases more air and less gasoline in proportion are required. Few carburetors, however, of the old style, accomplish this, and the motorist will find that by installing a petcock in the intake manifold as shown in

Digitized by Google

the accompanying illustration, he will be able to save considerable fuel. This petcock should be connected by a wire to a handle mounted upon the dashboard.

After the engine has been started and the car is traveling more than fifteen miles an hour, this petcock may be opened, admitting more air and decreasing the vacuum so that less gasoline will be used. As the engine slows down, however, unless the petcock is closed, the mixture will be too lean. Some motorists connect the petcock handle with the gasoline or spark lever, so that when one of these levers is retarded less air is admitted. After a few experiments the motorist will be able to adjust this very easily and thereby increase the car mileage per gallon of gasoline.

The Actual Experience of a Family of Westerners With Tractors

The Owner of Mules Was an Expert At Handling The "Long-Ears" But the Bray of the Animals Couldn't Match The Tractor's Exhaust.

OUT in the Far West is a family of prosperous farmers who are also experts at breeding and handling mules—the Ryans, of Merced, California; father and two sons. For years their lands and their livestock have been the pride of the district, and it is commonly accepted that what "old man Ryan" and "Jim" and "Bob" don't know about mule-flesh isn't likely to be picked up anywhere else.

The elder Ryan has farmed by mule-power for many years, and has made it pay. The brothers followed the same course for some time; then as power farming began to take hold as a big, practical, coming thing, they commenced to "think tractor" a little.

Not openly at first, of course; in such a family as theirs, that would have been almost equal to treason; but, being astute business men, they began to wonder eventually whether, after all, the mules were quite such ideal farm-power as they had been brought up to believe.

Finally, almost at the risk of breaking his father's heart, James Ryan ordered a tractor—a "Caterpillar," made by The Holt Manufacturing Company, of Peoria, Illinois, and Stockton, California. Traveling upon its endless tracks instead of on wheels, this machine looked strange enough to the elder Ryan and his neighbors.

Fighting the Rest of the Family.

But even a few years ago, the remarkable ability of the "Caterpillar" to pull huge loads, and to run easily over soft ground where wheel tractors might mire hopelessly, had won it fame and favor. To all appearances, two-thirds of the Ryan family were lined up solidly against the move and predicted financial loss—but James Ryan had made the plunge and was prepared to see it through.

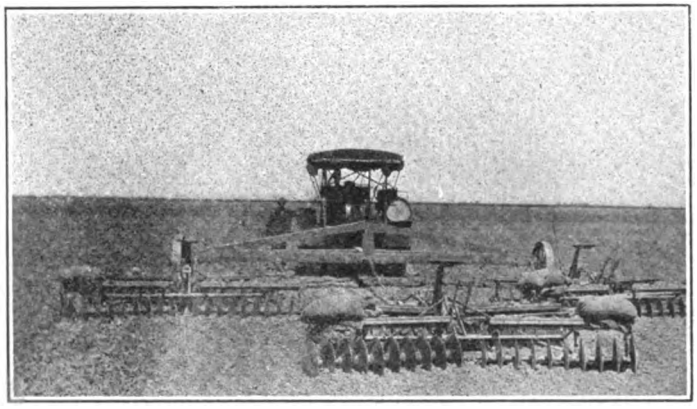
The "Caterpillar" arrived a little before harvest, and by the time it was limbered up, the Ryan grain was ready to be cut. To handle a large acreage, two combined harvesters had been bought. They were identical in every way—size, model, and width of cut.

"Bring on your 'Caterpillar,'" said Robert Ryan as he harnessed up his best mules one fine morning. "I'm going to show you up before noon." The tractor-wise brother said little, but turned up on the dot, with his outfit all set and primed to give the "long-ears" a run for their money.

Off they went at the crack of the lash in one field and the pop of the motor exhaust in the other. Everyone who has seen a "Caterpillar" Tractor at work can appreciate just what keen rivalry that morning's contest developed. This machine lays down its tracks in front and picks them up again at the back, with a fascinating precision and regularity; and it certainly ran true to form that morning.

The Tractor Gains a Lap.

Round and round the field they went, the motor hitting steadily and the tractor drawing always a little farther ahead until, despite the whip, the mules had been left a full lap behind. Then Robert Ryan gave the grand hailing sign of distress. "You win," he conceded—and the "Caterpillar" came into its own at Merced.



With its standing thus established in the "enemy's camp," the outfit continued its good showing through the season. Then, concluding that a larger model was needed, James Ryan ordered another—a "Caterpillar-Seventy-Five." When that reached Merced, Robert Ryan's last doubt vanished, and he began to study the "Mules Wanted" section of the classified ads. He found a buyer—and soon the Holt people had a duplicate order to fill.

With this abundance of mechanical power on the Ryan Ranch, things began to move with even more vim, and the brothers found themselves with time to spare. "Teamwork" is the slogan of the Ryan family; so when the brothers, working together, were caught up with the plowing on the home plate, they began together to look around for outside jobs.

They found them; lots of them, for the neighborhood was "under-powered"—trying to do a big plowing, cultivating and harvesting job with insufficient facilities. Those two "Caterpillars" snapped up big plowing contracts as a frog snaps up flies; and the acreage they could turn was a nine-days' wonder to the whole community.

Digitized by Google

A few miles from Merced is a ranch that lies mainly "up-and-down." The owner farms the hills successfully, but he hires his plowing. He heard the Ryans were

Double Discing a Forty Foot Strip in the San Joaquin Valley with the Holt "75."

doing some real work, and invited them to come over and figure on the job.

Thinking a little competition might help, he called in a professional plowing contractor, also. This man started out from town in his little roadster to look the ground over. His car—one of a make that's generally supposed to be able to go anywhere and back—stalled on the very hills he would have had to plow. "Good *Night!*" he observed with deep feeling, as he turned back toward Merced.

The Ryans got the contract.

When they arrived ready for work, the ranchman was surprised to notice that each of the "Caterpillars" had a headlight. "We're going to work nights," the Ryans explained—and they did. For more than three weeks, those steep slopes hardly ceased echoing to the double roar of that "Caterpillar" team.

Doing Two Things At Once.

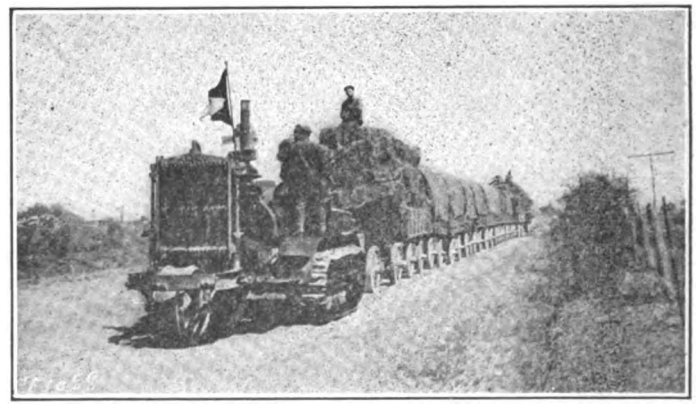
Each tractor pulled 140 inches of moldboard plows, running six inches deep; and hitched on behind the plows, a set of harrows; so the ground was broken and prepared for seeding at one round.

The actual working time was 23 days and 23 nights and the average length of each shift was 10½ hours. When the dawn broke on the twenty-fourth day, the outfits had two thousand acres to their credit—and the job was done. That meant that each tractor had broken and harrowed an average of more than 43 acres a day of 21 hours—over two acres an hour.

During the entire run, the fuel consumption of each tractor per 21 hours averaged only 35 gallons of distillate—a fuel which is generally inferior to good gasoline and costs somewhat less. The entire fuel bill for both tractors was only $218, and the lubricating oil consumption was very moderate, also—85 gallons supplied the two outfits over the entire contract. The customer was well pleased—and so were the Ryans themselves, for it gave them additional proof of what the "Caterpillar" could do.

Even so, the job wasn't wholly devoid of adventure. Late one afternoon, one of the brothers started to lay out a piece of plowing for the night crew. The custom was to plow a single furrow clear around the tract as a guide; then the operator could easily follow the lead after dark until he had made the round trip once or twice. After that, his work would, of course, be much easier.

A Narrow Escape.



At one point, the hillside dropped abruptly; to avoid this, the guide furrow made a sharp turn and followed a more gradual slope. Robert Ryan was plowing that night, and in making the first round he failed to follow this turn. A little later, feeling a sharp lurch, he stopped the tractor and walked forward to investigate. Imagine his feelings upon discovering the whole outfit balanced daintily upon the very edge of the cliff, with the forward part actually hanging out in space!

"I uncoupled in a hurry, backed to safety, drew a long breath and mopped my face," remarked Mr. Ryan in telling it. "But where would I be now if I had been driving a wheel tractor?"

The Ryan brothers have become attached to their outfits for various reasons just as practical as this one—that the tractor didn't coast down hill to ruin when it had the chance. Their satisfaction with both machines is all the greater because each of the brothers made his choice with great care—considering first the merits of wheel tractors against "crawlers," and then measuring and comparing the claims of the various types of the latter.

Their selection of the "Caterpillar," made from purely business motives, was probably not intended as an indorsement of the fact that Benjamin Holt was the first inventor to apply the endless track in a practical way to farm tractors; nor that his machine was—and is—the only one legally entitled to use the name "Caterpillar."

To the Ryans, these matters were purely incidental; but in buying "Caterpillar" tractors, they profited largely

The "Caterpillar" Tractor with the U. S. Army on the Border. These Machines Hauled Loads As Great As 50 Tons Over the Road.

by the many exclusive features built into the Holt product, and those qualities have enabled them to make handsome profits. And that *is* an object.

Digitized by Google

Occasionally the brothers were able to play tricks on their customers—of the kind that both parties could enjoy. One of these involved the cook at the ranch-house where their crews were to board while putting through a plowing contract of some hundred acres.

A Saving in Food.

On this ranch the plowing had always been done by horses—four or five teams working six weeks or so. The owners forgot that there might be a difference between horsepower and tractor power, so plans were made to board the crews for a long period. The Ryans and their men enjoyed that ranchman's hospitality for just one day more than a week; then they moved on with the plowing finished—all done to the well-known queen's taste—850 acres in eight days and eight nights.

Never for a moment, though, even at the height of these showy records, have the Ryans forgotten the needs of the old home place. Those came first; the only tractor-time that they sell is the surplus that remains when the home fields are tended.

In the season of 1916, for instance, James Ryan harvested 1,700 acres of grain with his tractor, pulling a 25 foot ground drive harvester. For nine consecutive days he cut 50 acres per day of eleven hours. On the whole job, the fuel consumption averaged only 35 gallons per 11 hours.

But someone may raise the point that the conditions that these men met and settled so fully are extreme ones; or that, while typical of the Far West, they have no counter-part in the East; or that very few Eastern farmers work upon any such scale as this.

The answer is that, in the main, the experience of the Ryan brothers will fit the case of the great majority of farmers who realize that there must be a more economical and efficient form of power than they will ever be able to get from horses. It will, of course, be necessary for one man to magnify the scale upon which the work is done, and for another to figure it on the "miniature" plan—but the principle is the same, either way.

Tractors Made in Many Sizes.

Of course nobody would advise a man with a small acreage to buy a tractor big enough to pull 16 plows, any more than the owner of a big place should be counseled to order an "8-16" or a "10-20" just because it loked nice. The tractor manufacturers have figured that out carefully, and many of them build a range of sizes. It's as much to their interest as it is to the buyer's to put the right machine into the job; and most of them can be depended upon to render a sincere service in fitting the tractor to the work it is to do.

The one outstanding lesson here—the one which most readers can apply personally—is the absolute frankness and open-mindedness with which Mr. Ryan approached the question when he first began to doubt the value of animal power.

He became convinced that mules were not the last word; from there he and his brother progressed to the point of applying thorough-doing methods—profitable methods—to the business of farming.

The difference between their case and that of hundreds of other men's is, we believe, one of size rather than of character.

Holt Tractor Plowing Tule Marsh Land in California. Reeds Are From Ten to Fifteen Feet Tall and Are Plowed Down and Rolled In As the First Step in Making the Land Fit For Cultivation.

EDITOR'S NOTE.—This is the first article of a series of stories which will be published from time to time and is published to show that there are many arguments in favor of the farm tractor. Every dealer should investigate tractors and make arragnements to sell them for undoubtedly there will be much money in this branch of the trade.

NAVY NEEDS GAS ENGINE MEN.

At Least One Thousand Men Familiar With Engine Work Are Wanted At Once.

THE Naval Reserve force must enroll at once 1,000 men, experienced in the operation and maintenance of gasoline engines. This is an urgent call. The men are required for immediate duty. They will be rated as machinists' mates.

Age limits are eighteen to thirty-five inclusive. Applicants must be American citizens. Draft registrants with letters from their local boards will be accepted.

Apply at Naval Reserve Enrolling Office, 51 Chambers Street, New York, or any navy recruiting station.

TRUMAN H. NEWBERRY,
By direction
Assistant to Commandant.

The A B C of Modern Magnetos and Electric Generating Systems

Part 1—The Electric System, Particularly the Generator, Is the Heart of the Automobile and Should Be Understood Thoroughly

BY A. P. PALMER, E. E.

WHEN a coil of wire passes around a piece of soft iron and an electric current flows through it the iron is magnetized and if the iron core be circular in form a magnetic circuit will be formed. The intensity of this magnetization is determined by the number of lines of force per square inch. This is called an electro magnet and if the electrical circuit is broken the iron core will be demagnetized. The strength of the magnetization will depend on the number of turns of wire and on the strength of the current. Steel is used in all cases where permanent magnets are desired but soft iron where a variable magnetization is required. If the iron core used be in the shape of a horseshoe it will be found that one end is a north pole and the other a south pole. A north pole of one magnet will attract the south pole of another and will repel the north pole of the second magnet. The presence of a magnetic field may be shown by placing a piece of paper across the two ends of the magnet and sprinkling iron filings across the paper. These filings will immediately arrange themselves in lines extending from one pole to the other showing the presence of the magnetic lines of force, as in Fig. 1.

A piece of metal that retains its magnetism after being removed from the magnetic circuit is called a permanent magnet.

Current Generation Law.

Now if an insulated coil of wire with an electric current passing through it will produce magnetism in an iron bar inserted in the coil, by reversing this process the magnetism will produce a current in the coil. In other words, if a conductor be passed through a magnetic field

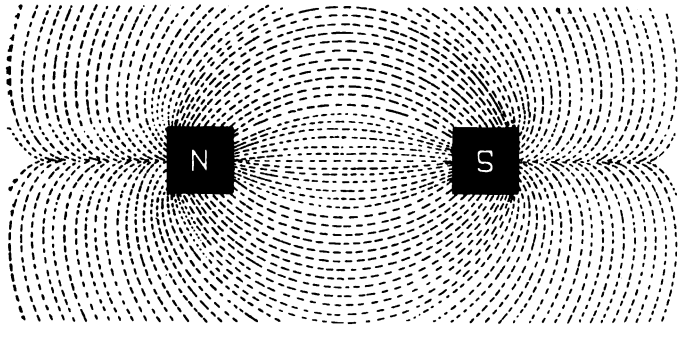

Fig. 1.—Showing the Lines of Force From a Horseshoe Magnet.

the cutting of the lines of force induces an electric current in the conductor.

In a magneto, the armature revolves in a field produced by permanent magnets while in a generator electro magnets are used. Where the device is depended upon, only to furnish ignition current, most engineers prefer the magneto because it is simpler and lighter than the dynamo. However, where a starting and lighting system is required a storage battery is necessary and for charging this a generator is preferable as direct current is required. In a generator each coil on the armature as it passes through the magnetic field, first one way and then the other, produces an alternating current. Now if the

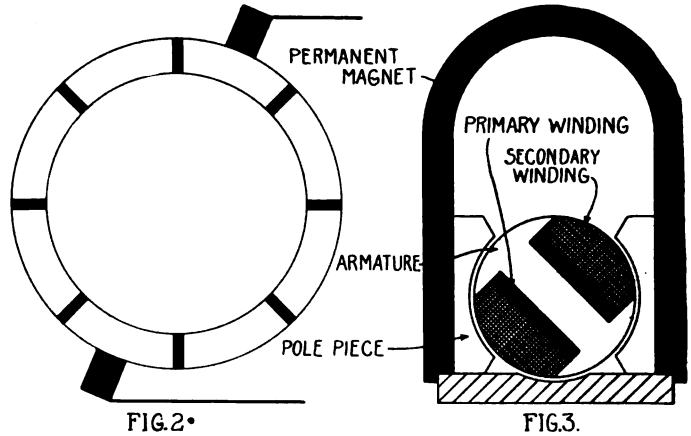

Fig. 2.—Commutator and Brushes; Fig. 3.—Section of Typical Magneto.

ends of the coil can be reversed as the current reverses, a direct current will be obtained. For this purpose a commutator is used, consisting of a number of segments in circular form (Fig. 2) insulated from each other and with which two carbon brushes diametrically opposite are in contact. The opposite ends of each coil on the armature are connected to opposite segments on the commutator.

Magneto Construction.

The magneto shown in Fig. 3 consists of two horseshoe permanent magnets, compound in form and to which are fastened two pole pieces, between which the armature rotates. Upon the armature core are two windings, a primary composed of a few turns of large wire and the secondary, a good many turns of fine wire.

The primary coil will deliver a current of small voltage but relatively large amperage while the secondary current is small but of high voltage. The current is alternating in character and the break in the circuit should occur when the armature is at the point where the greatest number of lines of force are out.

When the break in the primary circuit is made by means of a cam a current of high voltage is induced in the secondary winding and passes through a distributor to the spark plugs.

Digitized by Google

The distributor consists of an insulator in which are placed a number of segments, one for each cylinder to be fired, and so spaced that the number of degrees between them correspond to the ignition points of the motor.

Direct current generators are of different types depending upon the way in which the fields are connected.

1. When the current runs from the armature around the fields and then into the outside circuit the machine is called a series generator.

2. When a part of the current goes from the armature around the fields and the balance into the outside circuit, the machine is a shunt generator.

3. When two windings are used, a shunt and a series, the machine is a compound generator. The shunt winding provides an initial excitation sufficient to generate voltage at no load. As the load increases the current in the series field increases and prevents the voltage from dropping (Fig. 4). In a shunt wound machine the voltage is regulated by a variable resistance in the field circuit.

Electrical Units.

The unit of current, the ampere, is that amount which when evenly passed through a specified solution of nitrate of silver in water deposits silver at the rate of .001118 gram per second.

The unit of resistance, the ohm, is a column of pure mercury at 0° C. of uniform cross section 106.3 centimeters long, and 14.4521 grammes in weight.

The unit of electromotive force, the volt is $\frac{1000}{1434}$ the E. M. F. of a Clark cell at 15° C.

The volt is the electromotive force which will cause one ampere to flow through one ohm resistance.

The watt is the unit of power and is represented by a current of one ampere under a pressure of one volt.

Electrical Measuring Instruments.

For testing the strength of current flow in a circuit, an ammeter is used and for testing the difference of potential across two terminals a voltmeter. In an ammeter, part of the current passes through a shunt and the coil is of low resistance, while in a voltmeter the coil is of high

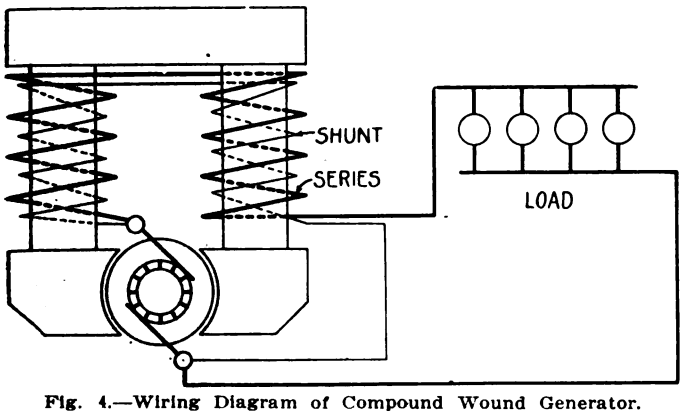

Fig. 4.—Wiring Diagram of Compound Wound Generator.

resistance and is connected directly across the terminals.

The instrument shown in Fig. 5 is the common type used. A coil of wire is wound on an armature of soft iron suspended on bearings between the poles of a permanent magnet. When no current is flowing through the coil the spring keeps the indicator needle at zero. As soon as current passes, however, a field is established and the armature being attracted by the field of the per-

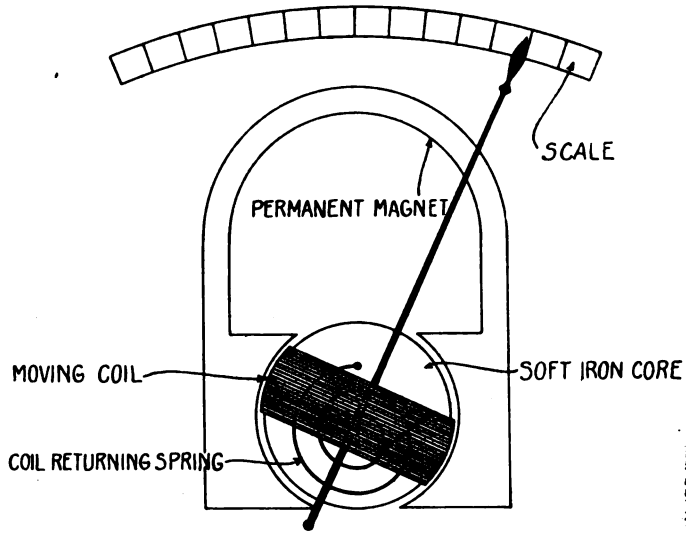

Fig. 5.—Illustrating Construction of Ammeter.

manent magnet turns and the needle indicates the deflection which is calibrated to indicate the amperes in the circuit.

The generator, used in starting and lighting systems, is used for producing current and varies in construction according to the system used. Some have an excited field while others have a permanent magnetic field. In the latter case permanent magnets are used, as in the magneto. In the other construction the field magnets, as well as the armature, are wound with coils of wire. In all cases the dynamo or generator should be mechanically driven from the engine crankshaft either by means of a direct drive by silent chain or through the medium of the timing gears. Belts are apt to break or slip.

In order to prevent excessive charging of the storage battery at high speeds a regulator is necessary, otherwise the voltage would rise so high as to cause a big inrush of current into the battery.

The electrical system of governing does not affect the speed of the armature, but accomplishes its purpose by means of a series field, armature reaction or by weakening the magnetic field. Ten to twelve amperes output is usually permissible in a generator.

Reverse Series Control.

The reverse series field control is accomplished by means of a compound winding (Fig. 6). The battery charging current passes through the series winding in such direction that any increase in the battery charging current tends to reduce the voltage generated, so that the battery is never charged at an excessive rate. When the lights are burning, however, current flows through this series, winding in the reverse direction, increasing the output of the generator and causing it to assist the battery in carrying the load. With the usual lamp equipment this increase in generator output is sufficient to operate the lamps without any demand on the battery

Digitized by Google

at ordinary operating speeds. At low speeds the battery supplies a certain proportion of the lighting current and when the engine is idle the battery supplies the entire demand.

The generators with automatic potential regulators maintain constant voltage regardless of whether the battery is connected to the system or not. The battery charging current tapers off as the battery charge increases,

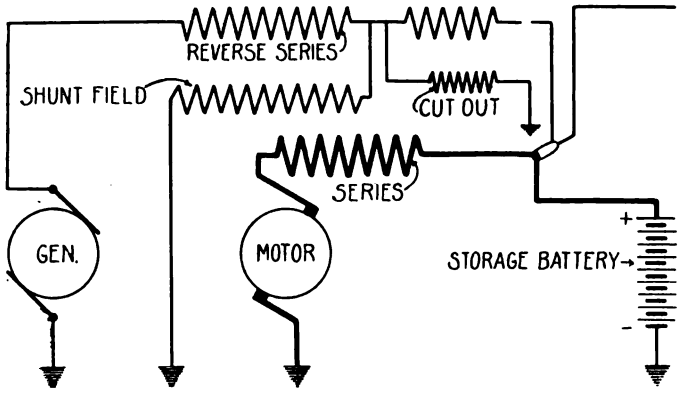

Fig. 6.—Wiring Diagram of Reverse Series Wound Generator.

being very large when the battery is in a discharged condition and of low value when the battery is fully charged. The voltage is independent of the speed and the amount of lighting load. The regulator consists of a vibrating armature that intermittently short-circuits a high resistance in series with the shunt field winding of the generator, the length of the short circuit period depending on the load on the generator.

Mercury Well Regulator.

Regulation on these systems was originally obtained by what is known as the mercury tube type of voltage regulator. It consists of a coil of wire surrounding a mercury tube, consisting of a hollow cylinder of german silver, lined with insulating varnish, and having two pools of mercury inside, separated from each other by an insulating cylinder of bakelite. The steel plunger which is also hollow moves up and down in the tube. The plunger itself moves in the outer well and the long steel needle moves in the inner pool of mercury. The two pools are connected by means of the resistance wound on the lower portion of the steel plunger, this resistance wire being insulated from the plunger by means of sheet mica insulation. One end of the resistance wire is connected to the needle and the other to the steel tube.

Now any portion of the resistance wire that is above the surface of the mercury will be inserted in the shunt field circuit. One terminal of the shunt field of the motor generator is connected to the bottom terminal of the mercury tube and the outer cylinder of the tube is grounded to the apparatus so that the shunt field is grounded through the mercury tube to the base of the apparatus box and thence, excepting during the cranking operation, to the frame of the car. The tube, the plunger and the coil of wire are all calculated so as to hold the voltage within certain limits.

Whenever the voltage of the motor generator rises above this value, the attraction of the coil for the steel plunger causes the latter to rise in the tube, thus inserting more resistance between the two pools of mercury and hence in the shunt field circuit, which in turn weakens the shunt field and causes the voltage of the generator to be reduced. This action continues until the voltage of the generator assumes a steady value.

Third Brush Regulation.

The motor-generator consists essentially of an iron frame and a field coil with two windings for magnetizing this frame. The armature which is the revolving element has wound in slots on its iron core a motor winding and a generator winding connected to corresponding commutators. Each commutator has a corresponding set of brushes which are for the purpose of collecting current from or delivering current to the armature windings while the armature is revolving. The current flowing into the motor windings from the storage battery turns the armature and starts the engine. When the engine is started current flows from the generator windings to charge the battery. The regulation is illustrated in Fig. 7. The full voltage of the generator is obtained from the large brushes "C. and D." When the magnetic field from the pole pieces N and S is not disturbed by any other influence each coil is generating uniformly as it passes under the pole pieces. The voltage from one commutator bar to the next one is practically uniform around the commutator. Therefore, the voltage from brush C to brush E is about 5 volts when the total voltage from brush C to D is 6½ volts and 5 volts is applied to the shunt field winding. This 5 volts is sufficient to cause approximately 1¼ amperes to flow in the shunt field winding. As the speed of the generator is increased the voltage increases, causing the current to be charged to the storage battery. This charging current flows through the armature winding, producing a magnetic effect in the direction of the arrow B. This neutralizes part of

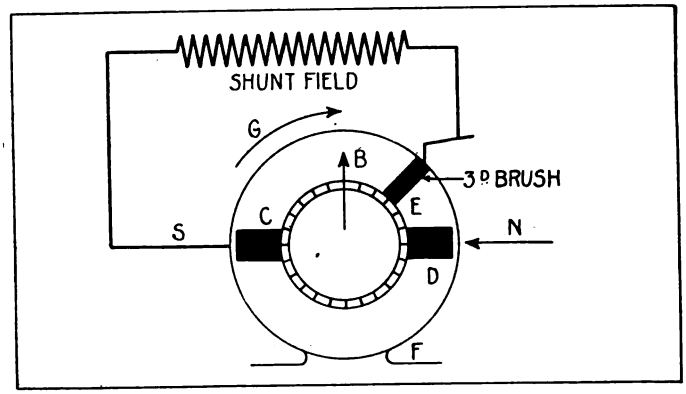

Fig. 7.—Wiring of Third Brush Regulated Generator.

the field and decreases the voltage generated from C to E, thus decreasing the shunt field current and regulating the terminal voltage.

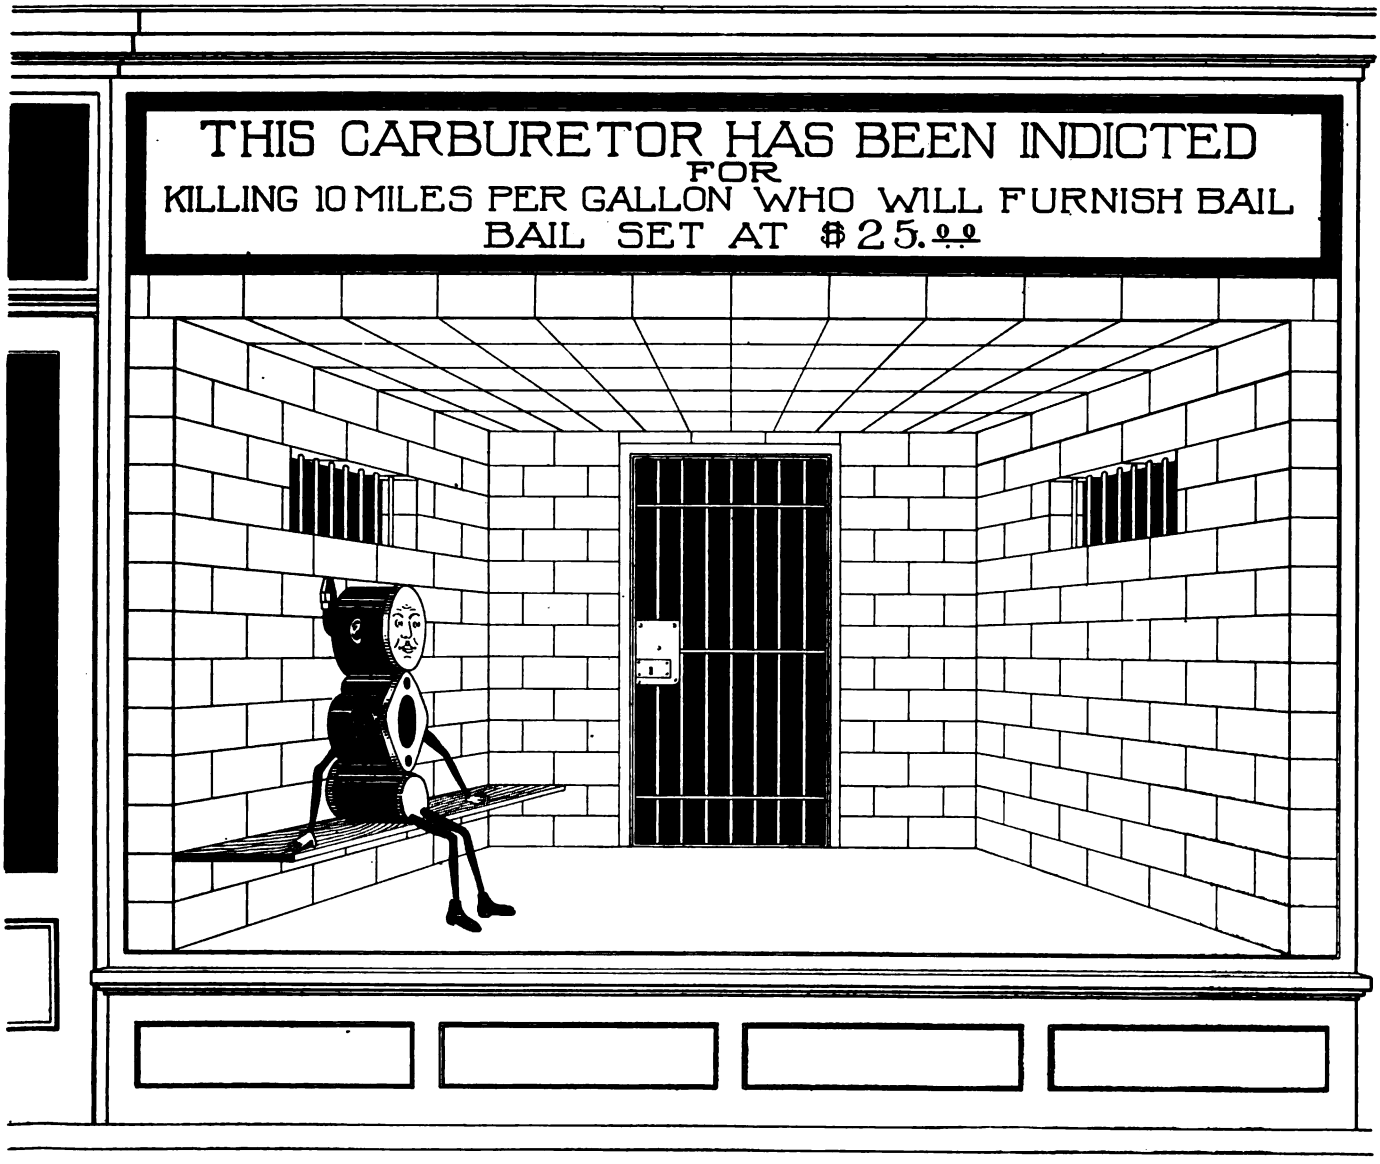
Attracting the Attention of the Passing Crowd to Your Window



If You Have a Show Window, Make It Act As a Silent Salesman, Trim It So That It Will Appeal to Every Person Who Sees It and So That It Will Advance A Strong Argument in Favor of Your Goods.

WINDOW displays may be divided, roughly, into two classes, those which attract attention because they are different and those which attract attention because they are artistic. The accessory store may use either the one or the other advantageously, but of the two the former is usually most effective.

A long time ago, window dressers discovered the fact that crowds always gathered around moving objects, and for a long time every up-to-date merchant had some sort of moving object in his window, even in the small country stores one might often see a play-card in the window hanging upon a string. Occasionally the play-card would make a trip to the top of the window and back again and there were always a few people waiting around to see the reason for it. Usually the crudest sort of a device was used. The twine upon which the sign hung might be attached to the door and every person who passed through the door furnished the motive power.

Modern Window Dressing.

To-day, however, this idea has gone out of style and

Digitized by Google

the merchant attracts attention by the uniqueness of his display. If he can get some particular idea in window dressing; something that will bring a question in the mind of the beholder, he can attract a crowd. Herewith is shown an exhibit of this type and to dress the window as shown in the picture but little time or money is required. It is bound to attract attention, and it not only brings a question to the mind of the person who sees it, but brings home an argument in favor of the device being exhibited.

In this particular case, the merchant desired to attract the attention of the public to a certain type of carburetor, which he was marketing at the time. He borrowed an automobile which was equipped with a standard form of carburetor and ran the car, in the presence of witnesses, over a measured course. Then he equipped the car with one of his carburetors and drove it for the same course keeping an accurate account of the gasoline consumed in both cases. He found that with his carburetor he obtained ten miles more per gallon upon that particular car and so he used this fact to advertise.

He took his show window and boxed it off to represent a prison cell, painting cloth to represent the stone walls and the openings. Upon one side he built a bench and upon it placed a large pasteboard model of the carburetor. Upon this pasteboard model he painted a face and fitted the device with rope arms and legs. The ends of the rope arms were inserted in a pair of gloves while the legs were placed in shoes, all to attract attention. At the top of the window he had the sign printed as shown in the picture. The cost price of this carburetor happened to be $25, and once the prospective customer had gone into the store to find out just what he meant by bail he could usually persuade him that $25 was a small investment that would pay large dividends.

Keep Up the Joke.

If the purchaser was humorously inclined the "jailer" was very apt to suggest that the prisoner could be bailed out for $25 and upon the payment of this fee the prisoner would become his slave for life. This same scheme might be worked out advantageously in a smaller window. A box measuring 3 feet in width, 2 feet in height and 2 feet in depth might be painted inside with gray paint and have the stone edges outlined in black. The door and windows might be cut out and black wooden bars put in place. The prisoner could be placed on the side as shown, while around the box at the sides and on the top might be grouped carburetors which the merchant was advertising.

Joining and Adjusting Repair Shop and Garage Machinery Belting

Carelessly Placed Pulleys, Shafting Poorly Lined Up, or Poor Belt Joints Cause the Waste of Power and Money in the Garage.

BY J. F. SPRINGER

A GOOD machinist knows that where there is friction there is destruction; he also knows that friction causes loss of power, and tries to eliminate it as much as possible. In a garage or machine shop the power machinery must be kept to efficiency but unless the shafting is lined up correctly, and the belts properly joined at the ends, the friction, in the power transmission alone, amounts to considerable. A solid and heavy belt joint in passing over a pulley often shakes the whole line of shafting and the good machinist does not permit a poor belt joint in his shop. There are two types of belt joints, cemented and laced, and both require considerable care in their preparation.

The Butt Joint.

When uniting leather belting by means of lacing, a butt joint should be used; the ends of the belt are cut square so that they fit together without being beveled. Two rows of holes should be punched in each end of the belt. These holes may be round but preferably are oval. If the belt is three inches wide, each row should contain two holes as shown in Fig. 1. A wider belt may be given three holes in the row next to the end and two holes in the rear row. If the belt is quite wide; five or six inches, four holes should be used in the front row and three in the row at the rear.

In every case where there are a different number of holes in the two rows the holes should be "staggered." Thus, with three front holes and two rear ones, each rear hole should be placed half way between consecutive front holes.

If, on the other hand, the belt is very narrow, a single row of holes may be used in each end. In this case the holes should be punched exactly opposite each other and an extra hole should be placed back of the rear hole about half way between the sides of the belt. In lacing, the strip of rawhide or other lacing material should be so managed that on the side of the belt next the pulley all of the "stitches" will be parallel with the length of the belt. There are no oblique "stitches" on this side. On the outside face of the belt, however, there will be such "stitches."

Laying Off the Belt.

I will now explain how to lay off the belt ends preparatory to punching the holes where there are to be three holes in the front row and two in the rear row, as shown in Fig. 2. Suppose the belt is 4½ inches wide. Two

Digitized by Google

lines should be drawn parallel to the end edge of the belt, the first line 7/8 inch back from the edge and the second line another 7/8 inch back. Then lay off parallel

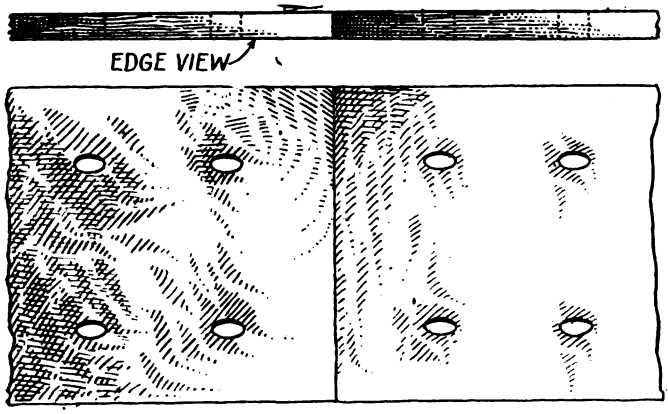


Fig. 1.—How Holes Are Placed in a Narrow Belt.

lines lengthwise of the belt and dividing its width into six equal intervals.

Three points should be made where the lines cross, next to the end, beginning with the crossing nearest a side edge and leaving two spaces between one hole and the next in the same row. There will be then three holes in the front row, 1½ inches between centers with ¾ inch distance from the center of one side hole to the outside edge of the belt. The two holes in the rear row are also put two spaces apart, and there are also two spaces between a hole and one side edge of the belt. The illustration makes all this clear.

The sizes of the holes will vary with the belt. For a three-inch width a 3/16-inch hole is suitable, and for a wider belt, up to six inches, a 7/32-inch hole is the proper size. The width of the lace may be 1/16 inch greater than the diameter of the holes.

Glued Joints.

When the joint is to be made by gluing, six or eight inches should be added to the length of the belt. The extra length is necessary because a lap joint is to be made. Under no conditions, however, should the thickness be increased where one end is lapped over the other. Consequently provision is made for this, by thinning the ends evenly, from a distance back of the end down to no thickness at all at the very end; see Fig. 3. The distance back of the end is exactly the amount of the extra allowance in the length of the belt.

The two ends should be glued together under heavy pressure. This is a good way, and is perhaps the most practicable.

A great advantage is that the belt is now an endless loop with no inequality in thickness or extra weight at the joint. The disadvantage is that a good deal of time is required. This would not be important if it were not for the fact that belts stretch as they are used and require taking up at the joint from time to time. With the lacing system and with the metal fastener system, the belt is readily and quickly shortened. When gluing the joint, we may add to the strength by using a number of smooth metal rivets.

Metal Fasteners.

Belt ends may be joined by metal fasteners. One such fastener consists of a single piece of metal provided with two rows of points. But putting these points through the belt ends, one row through each end, and then clinching the points on the other side, a joint may be made very quickly. Other metal fastenings consist of staple-like pieces. A number of these are used to effect the union of the ends. Then there are still other forms. One of these is a kind of stud similar to one of the usual varieties of cuff buttons. That is there is a little bent bar with a head on each end. Slot-like holes are prepared in the belt ends and the studs put in place.

To summarize the various methods: The spliced and glued joint is the best, but it takes time; the laced joint is perhaps the next best and it may be quickly made; the joint made by metal fasteners is perhaps not quite so good as a laced joint properly made, but it can be made in very quick order.

Arranging Shaft Lines.

In arranging line shaft, counter shaft and machine, it is well to bear in mind that belts should be arranged so as to press by gravitation on both pulleys and not simply on one of the two. This rule is effective in preventing the use of one pulley directly beneath another. In such a case, the upper pulley alone carries the weight of the belt, which is against the rule. One pulley must be separated horizontally from the other. Do not be afraid of having a long belt. A considerable horizontal distance between pulleys is better than a short one. The belt should sag. Naturally, it will often or perhaps usually happen that one pulley is higher than the other. This is

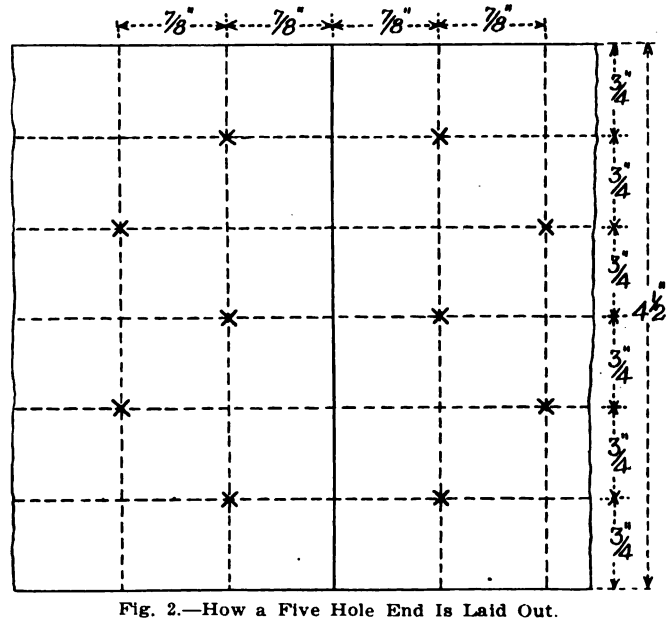

Fig. 2.—How a Five Hole End Is Laid Out.

all right, but the line drawn from hub to hub should not make with the floor an angle greater than 45 degrees.

In order to determine the length of belt to order for a given case, one may proceed in several ways. The easiest

Digitized by Google

thing to do in many cases is undoubtedly to run a tape line around both pulleys and draw it up properly with as little sag as possible. This will give the length for a loose belt. To get the proper length to produce a

Fig. 3.—Side View of a Glued Joint.

suitable degree of tension, subtract two per cent of the total length. This is for single-thickness belts. If the belt has a double thickness subtract somewhat less, or from one to one and one-half per cent.

The counter shaft will often rotate faster than the line shaft. That is, the pulley on the counter shaft will be smaller than its line-shaft companion.

Twisting Belt Lines.

Sometimes it is desirable to rotate one shaft in one direction and the companion shaft in the other. This may be done simply by crossing the belt between the two pulleys. At other times, one may desire to set on shaft at right angles to the other. If the shafts are not too close together, the belt may be twisted sufficiently to accommodate the rim faces of the two pulleys, provided the setting is correct.

Some explanation is needed here to make clear the meaning. When two pulleys are belt-connected, one is the driver and the other is the driven. The driver pulls on one-half the belt and "lets go" on the other half. The driver exerts its pull from the point where the belt comes onto the rim and for a distance around the wheel. It is important that, from the point where the belt arrives on the driver, to the point where the belt leaves the other pulley it shall lie squarely in the plane of the driver. That is, all the belt actually on the driver and all of the tight side of the belt from driver to the driven pulley must lie in one and the same plane. When this arrangement is carrid out, then the tight part of the belt is not being pulled out of the plane of the driver, but only suffers a quarter-twist in that plane.

Keeping Ahead of the Scrap-Pile in a Small Repair Shop

Iron and Brass Scrap Should Be Sorted Carefully and Only Those Articles That Can Be Restored To Good Condition

BY W. A. MANN

FOR the really heavy stuff it will be better to have a series of substantial bins on the floor, and they can hold big springs, castings, heavy shafts, axles and parts, rims, etc. It is not very likely that there will be, and there should not be, much accumulation of this heavy material in a small shop. Cylinders that are so badly smashed that they are not worth repairing are not likely to be of any use and the same may be said of crankcases and transmission housings and, in fact, most of the heavy stuff.

Unless the boss can see some profitable use for such things they are better allowed to accumulate only until there is enough to bring a worth-while figure from the junk dealer. Care should be taken, however, to keep the different kinds of metal separated—cast iron, wrought iron, ordinary mild steel, alloy steel, aluminum. There is a wide difference in the prices of different kinds of scrap, and well the metal dealer knows it.

Some of the scrap affords opportunity for more or less work on the side, allowing the boss to keep himself and his men occupied when they might otherwise be idle, and turning an honest penny at the same time. For example, a spring with one or two leaves broken can have new leaves put in and be put in shape to be sold to someone who wants a spring replaced and will be glad to get a used spring at a reduced price. Once in a while an opportunity occurs for making quite a neat little sum, and one of these opportunities came under observation during the past winter.

A repairman who has a shop that does quite a large variety of work, including autogenous welding, was called upon to put a new cylinder block into a four-cylinder car. The water had been allowed to freeze in the cooling system and the result was a burst water jacket that looked rather bad, and the owner simply ordered a new block rather than have the old one repaired.

He Made a Job of It.

The old block, left in the repairman's hands, was entirely overhauled. The jacketing was welded up; the cylinder walls were intact. The cylinders were reamed true, having been slightly worn. Finally, the boss invested in a set of new pistons, oversize, and fitted them in. Then the whole thing was set aside to await its chance. It was an investment, and though the boss was reasonably sure he would cash in on it sooner or later, he could not of course tell how long he might have to wait.

As a matter of fact he waited about eight months. Luck was with him, for a car of the right make and model came in, on the end of a tow-rope, with one of its cylinders badly smashed by a broken connecting rod, though the crankcase was but slightly damaged. Speed was asked for in getting the machine in running order, and the boss figuratively patted himself on the back as he

Digitized by Google

hauled out his repaired cylinder block and got the car running at least three days earlier than would have been possible had it been necessary to order a new block and wait for it to arrive.

Though it is not to be expected that such things will happen every day, the shop proprietor can readily take advantage of the principle involved in this transaction. Parts can be kept carefully until, perhaps, there are enough to be assembled into a fairly good whole. Or maybe the parts themselves can be put into such condition as to be used again, as has been suggested. These all are things that have been done, time after time; yet it is not common practice among garage operators to do them.

The High Cost of Steel.

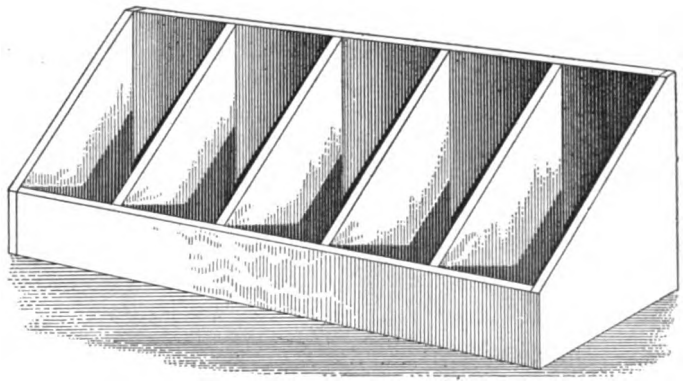
Scrap tool steel should be handled with much care, for the present price of tool steel makes its purchase burdensome. When it is required that some new tool shall be made there is no use buying the steel if it is already on hand in some form. Broken drills, taps, old files, all can be turned to account. Of course the drills and taps will be used until nothing is left but the shank. The idea of throwing away a drill because it is broken short, or a tap for the same reason, is not countenanced even in a big shop. Short drills and taps cut as well as long ones and they have a positive advantage for some kinds of work, for the shorter they are the harder they are to break.

When a tool actually gets beyond its original usefulness, however, it becomes stock steel. It can be softened by heating it to a cherry red and burying it in lime overnight—or even burying it in the ashes of the forge, if a coal fire is used. A second annealing will make it still softer, but care should be taken not to make the steel too hot or it will be spoiled for tool-making purposes.

Occasionally the necessity arises for making a new part for some place where the original part showed abnormal wear or weakness. If the original was of ordinary soft steel the repairman has a chance to make an improvement by putting in a piece of tool steel, and the raw material may be conveniently taken from some of his scrap stock, using the piece that comes nearest to the requirements of the moment.

Old files are particularly valuable. Softened as described, they can be used for many purposes. Even without softening they have their uses, or at least some types of them do. A half-round, a fish-back or a flat file can be made into a very fine scraper by grinding off the teeth and grinding the end perfectly square across. Carefully made, such a scraper will hold its edge and do good work for a very long time. A piece cut from a small square file can be converted into a very fine center-punch, the grip being left square and with the teeth on but just touched up on the emery wheel or grindstone to take off the harshness, and the head and point ground round. A round file can be used in the same way.

In a shop where there is a small lathe all the tools can be made from old file-steel, and the many odd-shaped little chisels, that so often are handy, can be formed up from the same stock. File steel is good for making permanent magnets, such as often are used for fishing purposes, recovering small iron or steel parts accidentally dropped into places where the hand cannot reach. Once started along this line of work the ingenious garage man will soon discover that there are many other ways of using scrap steel and thus economizing, which means adding to the ultimate profits of the shop.



Many Uses for Tubing.

Steel tubing of all sorts should be kept most carefully, for there are many uses for it, and, like tool steel, it is expensive just now. In fact it often is difficult to get it at all, especially in certain sizes. Many a badly worn shaft has been saved, by shrinking a sleeve of steel tubing over the worn part and turning the new part down to the proper size and accuracy of surface.

Often a piece of tubing will come in handy for a job where the repairman would otherwise have to drill through a piece of solid stock, and this is no joke in some cases. Tubing is good for making sleeves, spacers, for splicing and repairing. Steel tubing cannot be hardened like tool steel, but it can be case-hardened if necessary, and it usually takes a very good "case."

There's Much In It.

It is earnestly suggested that the reader, especially if he is considering the establishment of a repair shop, give genuine thought and attention to this matter of saving space and making the most of scrap, rejected parts and odds and ends. The writer knows by experience that there is actually a great deal more in it than appears on the surface. The most efficient use of such material comes with practice and experience. The more ingenious and quick-witted the repairman is the more he will get out of his junk. And be it said that, further, the more of this sort of material he saves and the better he classifies it, the more uses he will be enabled to make of it.

Suggested Design for Large Scrap Bins.

Many a clever bit of special shop apparatus has been put together with a piece of shaft from one box, a

Digitized by Google

couple of old bushings from another and various odds and ends, the whole outfit costing perhaps almost nothing except the time put on it. The handling of this material in the proper way gradually becomes a fixed habit.

When putting a scrap of tubing into its proper box the mechanic thinks to himself "There's a bit of stuff that'll make a sleeve for a brake cross-shaft for a Blank car" or "Those bushings can be turned down to fit the camshaft of the Dash 1917 machine," and when various repair jobs turn up he has in his mind a pretty good idea as to where he is going to get his stock, or at least where he is going to look for it.

Don't Junk Valves.

Old engine valves are good to keep for two reasons. One is that the stems are good for use where small pieces of round steel are wanted, and in many cases the steel is of very good quality. Another is that it often is possible to take an old valve and make from it a brand new one of smaller dimensions, this being a simple piece of lathe work. Making valves would usually come under the head of off-time work or else emergency work.

It would hardly pay to make valves in this way if new ones were easily obtained. In making over valves it is necessary to look out for those which have cast iron heads and steel stems and make sure that the junction of the two metals is not weakened in the remaking process.

Old valve springs are not worthy of much attention. A valve spring that has been in service for a long time loses much of its good qualities. Some of the better preserved ones may be useful, however, for emergency replacements or for some odd job where a spring is needed that does not have to stand the tremendous duty that is imposed upon the valve springs.

There was a repairman in the Middle West who carried the principle of using up scrap about as far as it could be carried. He had a fairly large shop, did a good business, and he had his material sorted according to the plan we have described. In truth, he is responsible for most of these ideas, and it is his example that has shown what real economy can come from such work.

This man took it into his head that he could build a complete engine from scrap parts, and for two years he saved sets of parts of three different makes, to try to get enough for his purpose. He was like a boy "saving up" for a bicycle, and he took a great deal of fun out of his hobby. Finally he saved everything he needed for an engine—it was a Ford, as might have been expected—except the camshaft. He could not get hold of a camshaft that was fit to use, so he bought one; but it actually was the only part of the engine that was not repaired scrap. The engine ran apparently as well as a new one. It may be added that the flywheel magneto was not included; an ordinary flywheel was used, and battery ignition. Whatever became of the motor the writer does not know; but it was the ingenious repairman's idea to get together scrap enough to build the balance of a chassis and so have a complete "junk car."

WOMEN IN BUSINESS.

Women Are Becoming a Big Factor in the Industrial World and Do the Work of Men Satisfactorily When Properly Trained.

"WOMEN engaged in industrial work, in the shop and factory, are adapting themselves to conditions, and grasping the fundamental principles of their work, with a readiness and efficiency that is truly surprising and gratifying."

The above statement from E. F. Primmer, manager of the employment department of The National Cash Register Company, Dayton, Ohio, is based upon close study and information obtained at first hand in one of the best known industrial concerns in this country. Mr. Primmer further said:

"While an untold number of reports have been made, the subject of women in industry is constantly enlarging. What seems strange and startling to-day is commonplace to-morrow. Government reports, magazines and newspapers daily are filled with statements about the ever-widening horizon of women's work. Women are eligible for employment in so many unusual occupations that it would be difficult to briefly enumerate them. There seems to be, however, only one boundary to the field of women's activities, and that is imposed by physical limitations. No one will argue woman's physical equality.

"In England, where there was a national desire to help meet the terrible emergencies of the war, women unwisely overrated their strength and set themselves at tasks which later proved detrimental to their health. American industry, profiting by the experience of England, wants continued output, rather than sporadic bursts of effort. Every man and woman in industry to-day, or in the future, must realize that it is the steady pull that will count at this crucial period in the world's history.

"While the great influx of women into industry was hastened by war conditions, yet it has not been wholly due to that cause. Armies of women are earning their own living because of the stress incident to the increased cost of all things. Hundreds of women have gone into the industries because they desire to be independent, and they do not regard their jobs or positions merely as bridges over the gap until marriage.

"Their induction into industry will have a beneficent, permanent result. It will mean the introduction in many factories of systems that are important to the health, safety and welfare of all employees. Improper surroundings will be eliminated and labor in general will be better off and better satisfied because of more desirable working conditions.

"There are, however, some things the women must be taught besides being given specific training for specific work. They must learn to be regular in attendance, because they cannot expect to earn good wages unless they work steadily. They must adopt a business-like attitude toward their work, and regard their tasks as an opportunity for personal training, whether they expect

Digitized by Google

to use their experience in the field of industry or elsewhere. They must regard health and hygiene as a business asset. Women are notably careless in matters pertaining to health, and frequently are unaware of the part poor health plays in reduced earnings or future happiness. They must be frank, straightforward and forego the privilege of having 'feelings.' If they remove the handicap of claiming privileges because of sex, they will find greater opportunities for advancement and sooner realize their ambition of equal work for equal pay.

"This company has always employed a large number of women for clerical and other work, and with very satisfactory results. However, it was only when the war came, completely changing industrial conditions throughout the United States, steadily decreasing the number of men available for both skilled and unskilled work, as the demands for war materials increased, that it was found necessary to employ more women in this factory. They have made good in a manner so satisfactory that the opportunity for women to engage in industrial work here will be greater each day, as the men are called for military service. Our company has positions open for many women."

It is interesting to note in this connection that it was the women who saved the labor situation in England. By the energy and ability displayed, they awakened the people and were given the right to vote, as a small measure of thanks for the tremendous work they are doing. In England women are doing nearly everything that men have done, and doing it well.

GLOWING TRIBUTE TO THE AUTOMOBILE.

THE following essay on the automobile, contributed by Dr. Frank Crane to the New York Globe, will no doubt be read with interest by a great many of our subscribers.—Editor.

Civilization is a matter of Transportation.

The true symbol of the Twentieth Century, the sign of its soul, the indicator of its spirit, is the Wheel.

The Wheel breaks down national barriers and unifies humanity, it removes prejudices, race hate, group egoism. All narrowness, superstition and ignorance give way before it. It liberates the soul of man from the grip of the past.

There was the horse-drawn vehicle with wheels, the steamboat, with its submerged wheel, the bicycle, the automobile, and the airplane. All are adaptations of the Wheel.

And the greatest of these today is the Automobile.

"There are," says John N. Willys, "some 4,000,000 of these passenger cars in this country. They are travelling 40,000,000 miles every day, the equivalent of 1,600 times around the earth. Their estimated annual passenger mile service is 60,000,000,000, against 35,000,000,000 for our railroads."

The automobile is not a competitor of the railroads; it feeds them. Transportation is a thing that grows upon its increase. It is not true that there is just so much travel, and if the motor gets part of it the train gets that much less. On the contrary, travel is elastic. The more you have the more you need. When they built the elevated and subway roads in New York it did not empty the surface street cars; it filled them fuller than ever.

The automobile truck is especially useful for the short haul. Already there are a number of established truck routes for freighting. A vast deal of the suburban delivery business in the cities is done by motor, yet the railways are as busy as ever.

Last winter's transportation congestion gave us an idea of the danger from clogging the arteries of communication. As the motor truck comes more into general use such crises will be obviated.

As the typewriter increased the size of one's correspondence many-fold, and as the telegraph swelled the volume of communication without lessening the volume of mail, as the telephone multiplied messages without detriment to the telegraph, so the automobile has not been to the prejudice of the street car, steam train, or other means of carrying and going, but has simply added to the fluidity of commerce and traffic.

It has increased national efficiency. The farmer can get more work done with less effort. The doctor can see more patients. The jobber can serve more customers. The travelling salesman can cover more territory. The police can secure prompter action. The fire engine moves faster. The business man keeps more appointments. His wife attends to her social duties with less effort. Recreation is simplified. The great Outdoors is brought nearer the city. All forms of activity are lubricated, expanded, made easier and pleasanter. And the general health of the people is decidedly advantaged by luring them more and more into the fresh air.

The automobile, the ultimate wheel, has made life richer, freer and happier.

Real Speed.

There are still some parts of the country where an automobile is an unfamiliar sight. A touring car passed through a small town in northern Kentucky at top speed. As it disappeared from sight in a cloud of dust one old settler, rubbing his bulging eyes, remarked: "Gosh! Them horses sure must ha' been traveling some when they got loose from that gentleman's kerridge!"—Milestones.

When There's a Will.

Country Constable—"We haven't had any motorists violating the speed limit for 'most a week."

Justice of the Peace—"We'll have to arrange to lower the speed limit."—Milestones.

NEW YORK, JUNE, 1918.

Missing Numbers—Our Readers are requested to remember that it always gives us pleasure to re-send numbers which have gone astray in the mails.

The Automobile Dealer and Repairer in New Zealand.

Mr. R. Hill, Matlock House, Devonport, Auckland, New Zealand, is our accredited representative in New Zealand for obtaining new subscriptions.

We Want You to Feel That You Cannot Afford to Cancel Your Subscription

UNLESS something is done very quickly, shortly after the receipt of this magazine a new zone postal law will go into effect. This will mean that the cost of the magazine will be increased considerably and with the increase of the cost of paper and labor, our expense will be nearly double.

We trust that all of our readers are loyal to us and we hope that they appreciate our magazine. We do our utmost to keep up the standard of reading matter in its pages. We strive to print only such articles as are of value to the automobile owner and the automobile repair man. We use our utmost efforts to eliminate all unnecessary "filler stuff,"—reading matter that is put in the magazine simply to fill space. We feel that we are safe in saying that our magazine only contains reading matter which is of interest to all of our subscribers.

This is not a newspaper. It is a magazine devoted to education. For the car owner it gives practical suggestions and information, in language which he can understand, that will be of assistance to him in repairing his own car if he cannot afford to have it repaired by an experienced mechanic. For the repair man the magazine gives suggestions for increasing business and for doing efficient repair work, written by contributors who have studied the automobile situation since its beginning.

For the automobile and accessory salesman there are stories, which should be of infinite value because of their originality. Every word should be of interest to every reader because the articles are so written that they bring out new facts and speak of the progress in the automobile field.

Even the so-called filler articles are valuable because they contain much information "boiled down" to just a little space. Nothing is repeated; nothing is copied. To use the expression of one of our enthusiastic readers, "the magazine is all meat."

One Way of Showing the Boys in Uniform That You Appreciate Their Sacrifice

UNDOUBTEDLY many of our readers are above the draft age and because of good reasons are unable to join the American forces in the camps on the other side. Everyone who cannot do their part by fighting should do their part at home. They should try to show their appreciation of the work that our boys are doing and lend their support to the soldiers who are striving to make democracy possible.

There are many ways in which you can show your appreciation of a soldier's sacrifice, and least of all you can give him a lift when you see him walking if you are riding in an automobile. It is very possible that he may be on a leave of absence for but a few hours and if you carry him any distance towards his destination he will feel that you are doing your part.

Not long ago the writer was at one of the training camps in the Eastern part of the country and every soldier with whom he talked, sooner or later, spoke of the kindness of a certain man who resided near the camp. This man owned a seven passenger car and he divided every Sunday into three periods of three hours each. This time he devoted to pleasure trips around the country. Invariably he invited a number of the soldiers to go with him, being careful to take those boys who lived far away from home and were most apt to be homesick. He said that he was more than repaid by the thanks of the boys and the pleasure that he derived from their society. Under any condition he would have used the car all day for recreation and he felt that it cost him but little more to share his machine with the boys who were giving their lives that he might prosper.

A Bill Which Should Be Considered Very Carefully Before It is Finally Adopted

THERE has been considerable agitation in certain foreign countries about a bill introduced into the House of Representatives providing for a distinctive national trade-mark under government license, to be attached to things of American origin. This bill to a casual reader might seem to be just what is needed at the present time. Undoubtedly many of the foreign countries will

Digitized by Google

show preference for American made articles and such articles should be identified by some means or other.

There is one big fear, however, of such a procedure as is recommended in the bill before the house and that is, that the trade-mark carries the impression that the goods upon which it is placed are sanctioned by the government. In other words, the bill is too broad and may cover "a multitude of sins." If the bill passes it will mean that all American products may be marked with this national trade-mark and we feel that it will operate to the detriment of efficiently produced, standardized American goods of quality.

A dishonest manufacturer would be especially eager to avail himself of the opportunity thus presented. His produce might be of an inferior grade and since it would bear this national trade-mark, it would inevitably result in the undermining of American trade prestige abroad. Foreign business houses or individuals who purchased goods of this kind would be prejudiced against American products. A manufacturer of high-class goods would be placed in the class of the manufacturer of inferior goods, and unless considerable care were exercised, goods bearing this national trade-mark might be shunned by foreign importers. We feel that responsible American producers are able to establish the preeminence of their products under their own marks of identification, and would not be interested in an "omnibus" trade-mark maintained by the government under which may be carried both reputable and disreputable goods. We feel that such being the condition goods need only bear the words "made in America."

If You Are a Loyal American You Will Not Permit the Waste of Gasoline

CONSERVATION is the word most used today throughout this country. It is only by making the most of our natural resources that we can hope to win the war easily. Undoubtedly we will win the war because every loyal American is doing his best to aid the cause. But there are two ways of winning it. We can be "bled white" if we are not careful, or we can "come out even"; it all depends on the way in which we "carry on."

We have fuel administrators and food administrators who are doing their best to make the American public see the necessity of preventing waste. Every time the automobilist uses his car unnecessarily, he wastes gasoline which might be used upon the other side. Permitting an engine to run for many minutes at the curb is a disloyal act. It is just as thoughtless as eating meat upon a meatless day.

It is true that the motorist may be able to pay for the gasoline which he wastes: that is not the question. Every gallon of waste gasoline means an additional cost later on and every loyal American will do his best to prevent such waste. Next time you see an automobile stopped at the curb with the engine running, make a point of speaking to the driver just as much as you would make a point of speaking to a pro-german were he to utter disloyal words.

There have been rumors that we would soon face a situation such as England is now facing, and the use of gasoline for passenger cars would be limited. Unless you want this situation to arise, do your part in preventing gasoline waste. Do your best to keep your car in the best of condition. Keep the carburetor adjusted and don't spend half an hour warming up the engine. Estimates indicate that during the past year enough gasoline has been wasted in various ways to supply our Allies in the war zone. A gallon which you may waste is not much perhaps, but taken together with the gallon which the other million car owners waste, the amount is considerable. In a certain sense the burning of gasoline needlessly may be compared with the burning of a house. It is property destruction and the persons responsible should be punished.

If You Drop Your Subscription Because You Have Enlisted, Let Us Know It

WE are proud that so many of our subscribers have joined the colors and intend to fight for our country, yet, on the other hand, we feel sorry to lose them. We trust that every one of our subscribers who cancels his subscription, because he has been drafted or has enlisted, will give us his reason for the cancellation. In this way we may be able to arrange for him to receive numbers of the magazine without cost.

We are always glad to furnish sample copies and we will be more than pleased to forward the Automobile Dealer and Repairer free of charge for the duration of the war to our boys who have enlisted. We are sorry that arrangements cannot be made to send these magazines to the American troops abroad but to do so would be an unpatriotic act, because of the congestion of mails at the present time. Should arrangements be made whereby soldiers can receive magazines, our subscribers who are in the service will be furnished with copies of our publication gratis.

An Interesting Complaint From One of Our Subscribers Who Gives No Address

ONE of our subscribers, who does not give us his address, complains that we do not always answer in the Trouble Department every question that is sent to us.

That is true. We would have to publish, some months, a magazine twice the size of this one if we attempted to answer every question through our publication. We do, however, intend to answer by mail every question that is asked us, and sometimes to do this requires an expenditure of time on the part of the editor in making investigations which amounts to several hours, and occasionally a whole day, just to answer one question.

The subscriber referred to says he has asked two ques-

Digitized by Google

tions, neither of which has been answered in our columns, but he admits that he did not sign his name, for some reason or other. As a general rule no newspapers or magazines pay any attention to questions or letters that are not signed by the writers. We do not publish the names of those asking questions, if they object, and never give their addresses, but we do insist upon knowing who is writing to us.

We would say now, for the benefit of Mr. A. L. Wade, who made the complaint referred to, and signs himself as "near Sacramento, California," that if he will write to us and repeat the questions he asked, and give us his full address, those questions will be answered promptly by mail.

Mr. Wade says, and perhaps he is correct, that 75 per cent of the help subscribers obtain from the Automobile Dealer and Repairer comes through the Trouble Department. What do our other readers think about this?

Mr. Wade also says that he is in favor of making the "ads." stand the increase in the cost of postage. It is quite apparent that our correspondent never had any experience in coercing advertisers. Advertising space is very much like any other commodity. People will pay for it what it is worth to them, and no more. It would of course be impossible to force advertisers to stand the increase in postage.

This brings up the question as to why postage needs to be increased. We have talked a good deal on this postage question, and most of our readers know that the new rate is outrageously excessive, and is bound to add largely to the cost of periodical reading matter throughout the country. The increase in subscription rates will compel a great many people to do without publications that they have become accustomed to, and would like to read regularly. If any reader has yet failed to write to his Representative in Congress, insisting upon a repeal of the new second-class postage law, he ought to do so at once, and also write to the two Senators from his State.

An Article You Should Read if You Intend to Purchase a Second-Hand Automobile

NOW that the output of new automobiles has been cut so greatly many people will find that they are unable to obtain new machines and are forced to purchase used cars. As a matter of fact, recently we received many requests from our readers for a story telling how to pick out a used car. We want to call the attention of our readers to the first story of our magazine dealing with this subject. We have tried to make the matter clear in every way so that an inexperienced buyer might purchase a car and be sure that if there were any glaring faults he would be able to discover them.

An automobile is an intricate piece of machinery and there are so many things that may go wrong without giving outward evidences of trouble. Even the most experienced mechanic may be deceived in a car. Sometimes new cars develop certain eccentricities which are puzzling so that the amateur buyer may not hope to discover every fault of the machine which he intends to purchase. However, he should be able to notice any apparent defect and make an estimate of the cost required for correcting smaller troubles.

If We Buy Only Bare Necessities Will Undoubtedly Strangle the Industries

PRESIDENT WILSON and Secretary McAdoo have both called upon the people of the United States to buy only those things which are essential to the health and efficiency of each person, in order to save materials and labor for necessary war purposes.

This advice may be good or bad, as the people try to conform to it. The logical result of saving in this comprehensive way would be to cripple the business of the entire country. If necessary for a time, of course everybody could get along with just enough to eat and drink, and a place to sleep. They could patch their old clothes, and buy no new ones, or anything else to speak of. But if this were done, thousands of businesses all over the country would be ruined absolutely.

Factories would shut down, because nobody would buy their output. Dry-goods stores, and similar places, would have to close up because they would be unable to sell anything.

If the people are making no money from manufacturing and selling goods, then how are they going to pay the enormous taxes the Government is demanding to carry the war to a successful conclusion?

The writer recalls that during the Civil War, business was even better than he had ever seen it before that war. Everybody was busy. People had plenty of money, and they spent it for what they wanted.

There is such a thing as carrying economy to a point where all business would stop, excepting war work. The men of the country, beyond war age, must have work in order to live. The women of the country must be taken care of; the children cannot be allowed to starve. To stop practically all industry, as has been recommended by the President and Mr. McAdoo, brings up the question, "How are the people to get a living?"

The benefactor of the race is the man or woman who spends money—not for bare necessities, but also for luxuries. It requires the employment of labor, and a lot of it, to produce luxuries as well as necessities. The individual suffers sometimes through spendthrift habits, but never the community. The miser may gain by thrift, and does; but the community loses by miserly habits, if they are practiced extensively.

There are many ways in which people can save money, and use it in helping the Government, without getting right down to the bare necessities of life.

Buy all the Liberty Bonds you can, and all the Thrift Stamps you can, and buy as much else as you can, so as to keep all the industries of the country moving.

Digitized by Google

This department is maintained for the protection of our readers—especially our reckless readers, if we have any.

The object is to encourage every operator of a motor vehicle to be careful and avoid accidents, especially the inexcusabe accident of a collision at a railway crossing.

OUR COURTS have been lenient heretofore with those automobilists who ignored the laws and those motorists who were willing to pay fines when they were caught speeding. Justice has not been stern—it has covered the iron hand with velvet. Yet—motorists take advantage of our laws, as the increased number of accidents prove.

Fortunately for New York City, our Judges have at last decided that the time has come when the laws must be enforced to their utmost and not tempered with mercy. Magistrate House has decided that the reckless motorist should pay for his speed and has established a scale of fines in keeping with the present high cost of living, from 30 to 100 dollars, together with jail sentences in some cases.

When the speeding motorist realizes that time is money—that he must pay for his miles per hour in proportion as he exceeds the speed limit—then he will begin to be more careful.

Reckless driving must be suppressed, and we feel that Magistrate House is to be commended for his judgment upon offenders. Other Judges may take their lessons from him.

In the month of March, according to the report of the Traffic Court, made public last week, there were 1,152 arrests for traffic violations as compared with 566 cases in March of last year. The total fines collected amounted to $11,700, and 183 persons were sent to jail.

The automobilists of New York may well be ashamed of these figures, and the money does not mitigate the crimes. Defiance of the law should be discouraged; a criminal who breaks speed limits, or drives carelessly, is a public menace and should be forced to pay the penalty. As long as the "speed maniac" is allowed to drive an automobile, the "safe and sane" drivers are in danger.

No matter how carefully you may drive your own car, you are not safe if such law breakers are allowed their liberty; they speed across intersecting roads; they "cut the corners"; they use either side of the street; and they force you to the ditch. Like the Kaiser, they want to "own the earth."

As you value your life, the lives of your family, and your own automobile, do not tolerate open defiance to the automobile laws. Do your part in making our roads safe for "careful" traffic.

PASSED ON WRONG SIDE.—One of the forms of reckless driving is shown in an accident which occurred in Peoria, Illinois, a short time ago. A Ford car, driven at a high rate of speed, passed a second car, on the right side, rather than the left, and crashed into an automobile which was standing at the curb. The driver made off without giving his name. Such a flagrant breach of the law should be met with punishment if possible.

AN INTOXICATED DRIVER.—Four men and a driver, all of whom were intoxicated, were badly injured in Baltimore late last month, when they disputed the right of way with a truck which was loaded with telephone poles. The damaged car was driven directly into the rear of the truck, and the telephone poles telescoped the machine.

NEW BOOKS RECEIVED.

WE want to call the attention of our readers to the following new and interesting books which have been received in this office during the past month.

The Model T Ford Car, including the Ford farm tractor, by Victor W. Page, M. E. This book is published by the Norman N. Henley Publishing Co., W. 45th Street, New York, and is a complete practical treatise which covers the operating principle of all parts of the Ford automobile. It gives complete instructions for driving and maintenance and in addition deals with the Ford tractor as well as many of the truck and tractor conversion units now on the market.

The Automobile Repair Man's Helper, by S. T. Williams, a 415 page book published by the U. P. C. Book Co., Inc., 243-249 W. 39th Street, New York. This book has been printed especially for the mechanic, for the owner or for the chauffeur who has anything to do with repair work. It contains many useful suggestions relative to all parts of the automobile and gives suggested layouts for garages and dwells somewhat upon garage equipment. This book should prove a valuable asset to any library.

The Gas Motor, by Max Kushlan. This interesting book is published by the Branch Publishing Co., 542 So. Dearborn Street, Chicago. It gives the principles of gasoline engines and is of great interest because of the many hints and suggestions one may derive from it. It covers in addition to automobile engines, the types of motors used for aviation purposes.

McGraw-Hill Book Catalog. The McGraw-Hill Book Co., of 239 West 39th Street, New York City, recently issued a catalog of all books published by them. This catalog has 226 pages including the index and we would advise any of our readers who intend purchasing books to write for this catalog.

Digitized by Google

TROUBLE-DEPARTMENT

This department is intended as a "trouble clearing house" for car owners, dealers and repairmen. Inquiries in relation to marine motors will likewise be answered as they are of interest to car owners and others who use the two-stroke cycle engine.

Readers are requested to make criticism and comments or to freely discuss any subject of interest to the automobile industry, and to add information of their own experience in remedying troubles.

Inquirers are asked to give the fullest information in every case so that replies may be made intelligently, and thus be of interest not only to the inquirer but to others.

Harley-Davidson Timing.

2438

From a Texas Reader.—1—Will you please explain the timing of a Harley-Davidson motorcycle? 2—What part does a breaker in a magneto play? I understand it brakes and allows the current to flow to the plugs at the proper time. But why is it that the points should go together and get ready to break for the next plug? Is it because the points in a magneto touch each other and make a complete short in order to allow the magneto to build up again or in other words, allow the coils to become full again, so as to discharge a hot spark? I would appreciate any information you can give me on this subject.

Reply.—The valves on this machine should be timed so that the exhaust begins to open ¼ of an inch before bottom center. The breaker points in the magneto should begin to separate when the piston has reached a point of 5/16 of an inch before top center of the firing stroke with spark fully advanced.

In the ordinary magneto the current passes through the primary or low tension winding on the armature in a gradually increasing amount until it reaches its maximum. At this point the breaker points separate and the current ceases. It is the law of magnetism that when lines of force are broken or cut electrical current is generated. The ceasing of the current in the primary winding breaks the lines of force and thereafter a high tension current is formed in the secondary coil and carried to the plugs.

We would advise you to obtain from the nearest library a book about magnetism or elementary electricity, for only in this way can you fully understand the theory of magnetos.

Difficulty In Starting.

2439

From J. R. Croy, Missouri.—I have been working on a 1915 model Ford touring car, which runs fine and has plenty of power, but in cold weather it will not start without hot water being poured on the carburetor. We thought that the magneto was weak and put in batteries, but without results. We cleaned the engine and the carburetor, ground the valves, choked the engine and flooded the carburetor, but without any effect. The car was hard to start when new, but after it had been used a while it ran a little easier, but now it is again very hard to start if the carburetor is not warm.

Reply.—We are very much afraid that we will be unable to help you, for this is one of the difficulties that comes with the use of heavy grade fuel, such as is being sold today, for if you will read the article in our March number, you will find the many difficulties which are encountered relative to the use of heavy fuel and in this way you will have your questions answered.

The writer has contended with a similar difficulty for nearly a year and can give you but little help. Be sure that the float level in the carburetor is just barely below the needle valve opening. Be sure that the intake manifold fits the block tightly. Difficult starting might be caused by leaks around the valve stems.

There are a number of devices on the market today for heating the carburetor or intake manifold, which you might investigate. The writer has used various devices such as hot sand bags, hot flat-iron and electrical iron units as well as hot water. This is just one of the difficulties that is bound to come up with the use of heavy fuel and we receive hundreds of letters containing the same complaint.

Ford Carbon Knock.

2440

From E. D. Smith, Missouri.—I have a Ford car, Model T, 1916, fitted with a Kingston carburetor, new timer, and new ignition wiring. It has worked very satisfactorily until of late when it has begun to knock and lose power. The compression is good, but at times the engine acts as though it was not getting sufficient gas. If I advance the spark, the engine begins to knock. It does the same thing if I open the throttle, and will not stop until I put the spark to within two or three notches of the top.

I have never ground in the valves, but I do not think the trouble is caused by carbon. Can you tell me what the matter might be?

Reply.—We think that all of your trouble is caused either by the valves or by carbon deposits in the cylinders. If the car has been running eight or ten thousand miles, undoubtedly the valves do not fit as well as they should, and they should be ground into place. When you have the engine pulled down to grind the valves, be sure to scrape out all of the carbon deposits which may have accumulated in the valve chambers, in the exhaust line, and in the cylinder heads. In reassembling the engine be sure that the intake manifold is tightly fitted to the block. We should advise you to use new gaskets and plenty of orange shellac in fitting the manifold to the engine.

Increasing Engine Stroke.

2441

From John Stoltenow, Jr., North Dakota.—I have an Overland, Model 81, and the engine has a four-inch bore with a 4½-inch stroke. How much power has it now? How much power would it have with a five-inch stroke?

Reply.—We doubt very much if you will obtain any more power from your engine by increasing the stroke one-half of an inch, for the very reason that horse power depends upon two factors, the volumet-

Digitized by Google

ric capacity of the cylinders and the speed at which the engine can be run. When you increase the length of stroke you will necessarily cut down on the maximum engine speed and therefore the gain in the stroke will be lost in the engine revolutions, just about averaging the horse power obtainable. We would not advise the changing of the stroke because of so many mechanical difficulties that you will encounter.

You will be obliged to buy a longer throw crank shaft, a new set of connecting rods and possibly change over the crank case a great deal. It may be that with a longer throw crank shaft the connecting rods will interfere with the cam shaft, and the results could not be relied upon.

Poor Radiation.

2442

From Robt. Hanlan, Massachusetts.—I have a little six Buick car, and when ascending hills on low or first speed the water in the radiator boils terrifically. What is wrong? Some tell me the pump, others the timer. Kindly give me your opinion.

Reply.—Your trouble with your Buick car may be due to a number of things, and we would advise you first to clean the radiating system thoroughly. Drain off all of the water from the system and replace it with a solution of strong potash lye and water which has been strained through a cheese-cloth. Run the engine until this solution is heated thoroughly and circulated through all of the water passages.

Then draw it off and flush the system with clean fresh water. If the engine still heats, examine the pump and be sure that the rotating member of the pump has not been broken from the shaft. There is a possibility that you have been running the engine with a spark too far retarded. The sparks take place in the cylinders with a fully retarded control, at approximately top center and while the engine is running you should keep the spark advanced as far as possible, but not so far as to cause a knock.

Grind in Transmission.

2443

From G. G. Nolan, Texas.—I have an Overland car, Model 83, and have trouble when I try to shift the gears from high to second speed. The gears seem to grind, and at times it is almost impossible to change from high to second without stopping the car. Can you tell me the cause of the trouble?

I have a Willard battery, one cell of which has been ruined; can you tell me how to rebuild the battery? I believe it is necessary to remove the plates and put in new separators. Will you tell me how to remove the cells?

I have a Splitdorf magneto which misses a great deal. Please give me instructions for cleaning it?

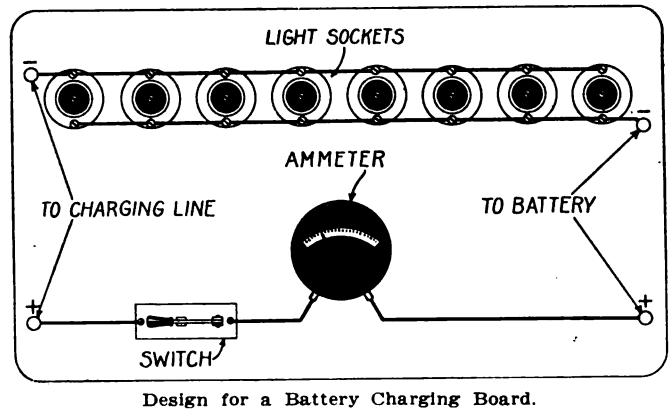
Reply.—Your trouble with the transmission of your Overland car is probably due to the fact that the gears are damaged. Due to the constant wear caused by the scraping of the gear teeth past each other in trying to mesh them, you have hammered over the edges so that they fit too tightly, and the only remedy is to remove the gears and file the teeth smooth or replace the gears with new.

The damaged Willard cell can be removed from the battery by cutting the connecting post about midway between the connections. Then with a hot putty knife soften the wax composition material which is used to seal the cell in place. The cell may then be lifted from the battery. The remaining parts of the connecting posts may be drilled out, and we would suggest that you consult a Willard service station to find the size drill and method of doing this work. With the top of the battery clear you may lift the cover from the cell, exposing the elements, which may be renewed and the parts replaced as necessary. As a general rule in repairing a cell new separators are used.

In the April issue of the Automobile Dealer and Repairer we started a story dealing with the construction of the storage battery, and from the story you will get sufficient instruction to enable you to overhaul your battery.

There are such a great number of Splitdorf magnetos on the market at the present time that unless we know the type of magneto you are using we will be unable to give you detailed instructions. If you will give us the type number and all marks which appear on this magneto, also a rough sketch of the front and side, we will advise you further.

Before cleaning the magneto you had better see that the magnets are fully charged. As a general rule the magneto will last for a long time and cause no trouble as far as the internal mechanism is concerned.



We think that your trouble is due to one of two things. Either the magnets have become demagnetized or the breaker points are not in good order and correctly adjusted. These points should be about .002 of an inch apart when the breaker arm is riding on the top of the cam. Examine them and be sure that their faces are smooth and flat. You will probably find it necessary to replace the points with new.

Electric Generator Troubles.

2444

From A. Ranken, New York.—Can you give me some advice as to where to look for troubles arising in electric generators, as well as the principal troubles generally encountered?

Will you give me a sketch of a charging board, of light resistance to be connected in circuit with lighting circuit for charging storage batteries? How

Design for a Battery Charging Board.

can one find which are the positive and negative poles of a circuit?

Reply.—The first trouble that develops in electrical generated apparatus as a rule, is in the brushes or the brush contacts. Brushes are made

Digitized by Google

of carbon and covered sometimes with fine mesh wire. The carbon wears very fast and the brushes are quickly destroyed. When new brushes are fitted they should be made to conform with the surface of the commutator against which they rest and can be filed or sand-papered into shape. After a number of sets of brushes have been worn out, the commutator itself is very apt to become scored, and to remedy this trouble the commutator must be turned off in a lathe. If the current generation is very heavy, the copper commutator segments may be turned and cause excessive sparking. In this case the insulating material between the copper segments is higher than the segments themselves and must be cut down below the surface of the segments slightly.

These are the more common troubles to be found in generators. There are many minor troubles such as the breakage of wires, but to give you all of these would require a rather thick book.

We give herewith a sketch for a suitable charging board.

The current running into the batteries can be varied by the addition or removal of the incandescent lights. Various size batteries require different numbers of lights.

To determine positive and negative wires from outside circuits dip two wires in a strong solution of salt and water. A great number of bubbles will arise from the negative wire.

Old Maxwell Transmission.

2445

From J. H. Boudreau, Canada.—I have a 1912 Maxwell, "Model Special," in which I stripped the second speed gear. I would like to replace the gear. Can you give me directions for taking out the old one and disassembling the transmission?

Reply.—To disassemble this transmission and remove the section speed gear, disconnect the control rods and the rods leading to the transmission, then disconnect the propeller shaft at the rear universal joint just ahead of the transmission. The transmission may thus be disconnected from the rear axle and dropped downward and clear of the machine. The main shaft or sliding gear shaft can be taken out by removing the front bearing carrier which carries the driving gear. All of the sliding gears from the upper shaft may then be slipped from their places and renewed if necessary.

Maxwell Will Not Throttle.

2446

From Edw. P. Teska, Wisconsin.—Will you please give me a little information about a Maxwell car, 1916 model. When I set the carburetor on a lean mixture, I cannot throttle the engine, and when I try to speed the engine up, it spits and dies down. If I set the carburetor for a rich mixture, it will misfire and choke up; sometimes, however, it works all right.

Reply.—Your trouble with your Maxwell car may be due to a number of reasons.

In the first place, examine the valve stem guides and be sure that there is no leakage at this point. Very frequently the guides wear and allow a slight amount of air to pass them, thus diluting the fuel entering from the carburetor. The valve stems should fit the guides very closely with little or no play, but in no event should the guides be so small as to bind on the valves. If there is a leakage at this point the guides should be replaced with new.

Examine the points where the intake manifold is joined to the cylinders and be sure that the joints are all tight. Leakage at this point results in the same troubles as leakage past the valve guides. If after examining these points you still have trouble with the engine, we would advise you to install a larger hot air stove on the air intake of the carburetor and investigate some of the heating devices now on the market.

Horsepower Required for Generator.

2447

From E. H. Hall, New Jersey.—Will you please tell me how much power is taken to operate a Gray & Davis generator which furnishes six volts and ten amperes?

Reply.—The theoretical horse power required to operate a dynamo having an output of 6 volts and 10 amperes is slightly over .08. From a practical standpoint this might increase to about 1/10 of a horse power, and unless there is considerable friction this figure is large enough to cover all power required.

You can verify this figure yourself by the following electrical rule. The product of volts and ampere is equal to a watt, and there are 746 watts in one horse power. Your Gray & Davis dynamo in furnishing 6 volts and 10 amperes requires 60 watts to run it, and 60 watts is slightly over .08 horse power.

Mica and Porcelain Spark Plugs.

2448

From Fred Kegal, Ohio.—Will you kindly tell me if spark plugs with mica insulation give as satisfactory results as those with porcelain, when used in a Ford engine?

How many pounds pressure should a gauge placed in the spark plug hole show, when the engine is turned over by hand?

I have a —— ignition lock on my Ford car, and have been told that the car may be started by wiring around the lock in some way. Can you tell me how this is done, and how it may be prevented?

Reply.—There is no reason why spark plugs with mica insulation should not give just as good results as those having porcelain. It is merely a matter of preference, some drivers preferring mica to porcelain and others vice versa.

The amount of pressure in a cylinder is indicated on a pressure gauge screwed into the spark plug hole and varies with the make of an engine. The average pressure on a Ford car should be between forty and fifty pounds per square inch. At the present time a Ford car with forty pounds compression gives better results than does a Ford car with fifty pounds, because of the fact that lower compression is required for low grade fuels of the present day.

An ignition lock such as you mention when used upon the Ford coil box can be short-circuited. There are a number of ways for doing this and as far as we know there is no way to prevent this device from being "shorted" out of the circuit. To understand the method used, let us follow the path of the current from the magneto to the coil. From the magneto the current travels to the porcelain terminal

Digitized by Google

on the dash. Through this connection to one point of the switch across the switch bar to the center, from the center to a long bar which is located at the bottom of the coil box. This long bar is fitted with flexible connections so as to make contacts with each of the coil units. In order to make the coils operate without passing the current through the switch, it is only necessary to connect the long part at the bottom of the coil box with the magneto. This can be done by removing one of the coils, dropping a wire into the box, and replacing the coil. If the wire has been scraped free of insulation and properly placed in the box, it contacts with the long bar and may be connected with the magneto and the car started.

If the lock has been attached properly, as it seldom is, the coil cannot be removed. In this case the automobile thief bores a hole through the bottom of the coil box directly beneath the copper bar and makes connection with the bar in this way. If the thief does not happen to have a drill, a hammer and a nail answers the purpose.

Chalmers Engine Backfires.

2449

From Wm. Croll, Delaware.—I wish that you would give the following information. I have a 6-40 Chalmers car, year 1916, and have had considerable trouble of late with the engine back-firing through the carburetor when I get in a heavy pull, or when the car is running at a speed of about 30 miles per hour. The repair man cannot seem to find the trouble.

Reply.—There may be any one of a number of different reasons for your trouble. In the first place, examine the valve setting. The flywheel is marked so as to indicate the opening of the various inlet valves. Turn the flywheel until the mark 1-6-In-O appears beneath the indicator at the top of its revolution. At this point the inlet valves in both No. 1 and No. 6 cylinders should start open. It may be that for some reason or other the valve timing of your engine has been altered. At any rate the valves must open as indicated by the marks.

Next examine the ignition. With the spark fully retarded, the breaker points should begin to snap apart at dead top center and should you find that this is not the case, remove the distributer brush from the distributer, unscrew the cam lock screw, loosen the cam and turn it in its direction of rotation until the points separate at the proper time.

There is a possibility that the gas mixture is too rare. See if you can prevent the back fire through the carburetor by cutting off some of the air entering through the air intake. If the engine operates with the air partially cut off, readjust the carburetor until it functions properly.

Make a comparison of the compression in the various cylinders. Turn the engine over with the handcrank and note whether the compression seems to leak past the valves. A leaking inlet valve very frequently results in backfire. Should you find this to be the case the inlet valves should be ground into place.

Your trouble may be due to the fact that the clearance between the tappets and the valve stems is insufficient. After the engine is heated, adjust this clearance so that it is not less than .002 of an inch. Examine the spark plugs, valve guides, and the connections between the intake manifold and the cylinder block and be sure that there are no leaks at any of these points.

If you still have trouble with this engine after trying the above experiments, let us hear from you again telling us just what you have done and the results, and we will advise you further.

Bosch Magneto Adjustment.

2450

From J. F. Sherman, Pennsylvania.—For some time I had some trouble with my automobile, which was fitted with a Bosch magneto. The engine operated very unevenly and I could not throttle it down without having it missfire. Having some knowledge of engines, I tried to repair it myself. I found that the spark plug gaps were set about 1/32 of an inch apart, so I adjusted them so that the distance was increased considerably. The breaker points in the magneto were set slightly closer than 1/32 of an inch, so I set them apart further, and the engine worked all right. Since making these changes, I find but one trouble—the breaker points burn away rapidly. There have been a number of repair men who have looked at the car and they all claim never to have seen a magneto with the points adjusted so far apart. They say that ordinarily the adjustment is about as close as the thickness of an ordinary piece of paper. Can you give me any explanation of this and the reason for this adjustment?

Reply.—We do not understand just what is the trouble with your Bosch magneto. As a general rule the breaker points should be set much closer than 1/32 of an inch, but we have found that different machines often require slightly different setting. One thirty-second of an inch is considerably more than we have ever seen in use and we can explain it only by saying that possibly some mistake was made in winding the machine and that it is a departure from standard design.

With this excessive spark gap, you doubtless will always have trouble because of the burning of the breaker box points. We would advise you to try to bring the spark plug gaps slightly closer together, leaving the breaker points adjusted as they are at present. This will reduce the strain on the breaker points, for as much current will not be drawn as at the present time.

There is a slight possibility that the condenser has been punctured, but if this is the case the repair can be made only at the factory.

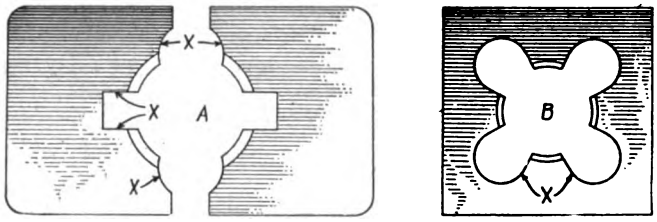
Use of Distillate in Engine.

2451

From Walter Smith, California.—I would like to know what are the harmful results in using distillate instead of gasoline in an automobile engine. I have been told that distillate would not burn completely and that a part of it would leak past the pistons into the base, diluting the lubricant and resulting in burned out bearings. Has distillate as much power as gasoline?

Reply.—With ordinary stock equipment you should not burn distillate in the engine, for the very reason that all of it will not be consumed. A certain part of it, as you suggest, will travel past the pistons and dilute the lubricant. The only answer

Digitized by Google



to this problem is to equip the car with some sort of a kerosene burning carburetor and specially designed manifold for heating the fuel from the exhaust. There are a few such devices on the market and we should advise you to correspond with the manufacturers. Distillate and kerosene are said to give more power, per gallon, than gasoline.

Sharpening Die Plates.

2452

From G. F. Colby, North Dakota.—Will you kindly tell me how to sharpen dies for screw plates?

Reply.—Dies are made in a number of different styles having removable cutting tools, as shown at A, or stationary pieces, as shown at B. Where the cutting members are removable, they may be sharpened by smoothing the faces at X upon an emery wheel. If the cutting members are not removable, the holes shown at X in Figure B may be reamed

Illustrating How To Sharpen Die Plates.

slightly larger. Where the whole die is case-hardened, this cannot be done unless it is softened first. As a general rule it is not practical to sharpen dies of the second type as shown in Figure B, unless the cutting members can be removed.

Transmission Trouble.

2453

From W. B. Thompson, Mississippi.—I have a 6-39 Model Linwood five passenger Paige car. The last few times I have driven the car, I have noticed a peculiar sound that seems to come from the transmission. The first time I heard this sound I was on level road, running about twenty-five miles per hour, when all at once I heard something that sounded just like gears jumping out of mesh, although the car did not jump or slow up.

I brought the car to a stop and then started up again and I did not hear anything more of this noise until I had run about three or four miles, and then the same thing happened again. I stopped and changed gears again and did not hear it any more. When I arrived in town I had the garage man drive the car for a while and he said he could not find anything wrong—the car seemed to run fine; but yesterday, when I had the car out, I heard the same thing again, and it sounded as though the whole transmission were tearing up, but after I stopped and started again I did not hear it any more, and finished my drive.

I have worked on the transmission and cleaned it all out, but could not find a thing wrong—the gears are in just as good shape as the day they were put in. I have had some people tell me that possibly this noise comes from the differential gears—I have had them tell me that if anything happens back there that it would sound as though it was in the transmission, but I don't see how it could be lack there, as the gears in the differential are all new and were put in only a month ago. The car has had no hard pulls or jerks that would cause anything to go wrong in the differential.

Reply.—From your description, we should be very inclined to believe that all of your trouble lies in the differential. From the very fact that you had it overhauled a short time ago, we are inclined to think that the work was not done correctly, or the gears were not correctly meshed. It is very possible that one of the new gears was faulty and caused all of the trouble.

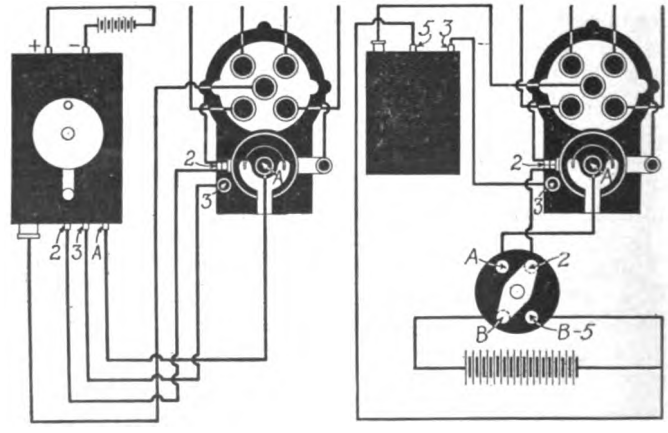
We should advise you to examine this part of the car and be sure that all of the bearings are tight before having the unit disassembled. You should be able to locate this trouble by jacking up one of the rear wheels, and with the clutch thrown in and the ignition off, turn the wheel by hand. This will bring just enough strain on the gears so that if one of the teeth is broken it can be located very quickly. If you do not locate the trouble in the differential, let us hear from you again and we will advise you further.

Unsatisfactory Lighting.

2454

From John Pederson, North Dakota.—I have a Maxwell car, 1916 model, and the lights are not satisfactory. For a short time past, they have been getting dimmer and give but little light. The battery tests from 1.250 to 1.300. What is the trouble?

I have a Simms magneto and would like to know if this machine should give good results without the use of spark intensifiers.



Reply.—Your trouble with the lights is probably due to the fact that the bulbs are worn out and the only remedy is to replace them with new of the same voltage and candle power. We would not advise you to install spark intensifiers on the spark plugs for the very reason that too much of a strain is put upon the magneto. Under ordinary conditions, the Simms magneto should give a good hot spark and you will be adding little or no power to the spark by the addition of the intensifiers.

On the other hand, should you install the intensifiers, you are very apt to reduce the magnetism in the field magnets.

Splitdorf Magneto Diagram.

2455

From P. E. Hedbloom, Minnesota.—Can you give

Two Wiring Diagrams of Splitdorf System.

Digitized by Google

me a wiring diagram of a Splitdorf magneto, Model D, as used on an E. M. F. 30, 1912 car? I would like to get a diagram showing this magneto wired with the coil, together with proper battery connections.

Reply.—We give herewith two diagrams showing the Model D magneto as used in conjunction with the regular dash transformer and as used with the Splitdorf tube transformer, and trust that they will meet with your requirements.

Radiator Tube Stopped.

2456

From Wm. E. Schleiter, Connecticut.—I would like to ask your advice as to the cause of trouble with my Maxwell 1915 Model 25 car. The water in the radiator begins to flow out of the overflow pipe almost as soon as the engine is started and by the time I have driven 50 miles the water is almost to the bottom of the tank. I recently spent $5.25 to have the radiator cleaned, but the trouble still remains. The fan operates all right, and the engine seems to be in good condition.

Reply.—There is little doubt but what the radiator tubes or the pipe leading from the lower tank to the engine is stopped up. We would advise you to remove the radiator from the car, drain it, and plug the lower end with a piece of wood. Then fill the radiator with a strong solution of potash lye and water, being sure to strain the solution before placin it in the radiator. One can of potash should be sufficient. Allow the mixture to stand for at least one hour. The mixture should be mixed with hot water. Be sure to remove all rubber water connections before putting in the solution.

If this solution does not remove the obstructions or deposits in the tubes mix up a strong solution of washing soda and water and let it stand about an hour. Make a careful examination of the engine water jackets and be sure that they are clean. A long flexible copper wire may be used in the water jackets as well as the radiator for removing solid matter.

Buick Differential Trouble.

2457

From Clyde Carpenter, Vermont.—I have a Buick Model E-35 car that has been run about 800 miles. At a car speed of between 15 and 20 miles per hour on high gear, there is a grinding noise, either in the gearset or the differential, and the vibration can be felt by a person sitting in the car. The repair man here tried to remedy the trouble and claims that the reason is that the gears are not as yet worn smooth and adjusted to each other. Will you give me your opinion on this?

Reply.—We are of the opinion that this trouble is in the differential and due to the fact that the master and pinion gears do not mesh properly. You should be able to adjust these gears yourself by observing the following directions:

Jack up the two rear wheels and put the transmission gears into neutral. Remove the hand hole plate in the rear axle and feel of the backs of the gears. The edges of the teeth on the two gears should be in line at the point of their engagement. Move the adjustments until this is the case, keeping the backs of the gears in line. Adjust them so that they mesh as deeply as possible into each other. In other words, to use a mechanical expression, make them "bottom." Then back the master gear away from the pinion gear one turn of the adjustment collar, back the pinion gear away from the master gear one turn of its adjustment collar. Then have two assistants turn the two rear wheels in the same direction at a fairly rapid speed while you listen to the differential. If there is an excessive grinding it is an indication that the gears are too deeply meshed, and you will be obliged to move the master gear away from the pinion gear a very slight distance. However, be sure to move the pinion gear away from the master gear a distance equal to the distance the master gear has been moved.

While making the adjustments all parts should be held stationary. After having made the adjustments and found the place at which the gears operate with the least amount of noise, be sure to return the adjustment locks.

Rear Axle End Play.

2458

From G. A. Pansln, Illinois.—I own an Allen Model 30 Touring car and the axle gives a humming sound when the car is driven on the left hand side of a crowned road; when driven on the right hand side of the road, however, and when driving on flat pavements the noise is not so noticeable. Can you tell me how to adjust this axle?

Reply.—Your trouble with the Allen Model 30 Touring car is undoubtedly due to the fact that there is excessive end play in the rear axle and differential, permitting the master gear to mesh too tightly with the pinion gear. Sooner or later this will result in excessive wear upon the pinion gear, and we would advise you to have it remedied. To compensate for play in the rear axle, we should advise you to remove the axle from the housing and insert between the housing and the differential housing a thrust washer made either from bronze or fibre. The former is preferable, though the latter will do nicely.

You may find that a fibre thrust washer obtained at a Ford service station answers the purpose. The play between the differential housing and the axle casing should be only about 1/64 of an inch.

His Hupmobile Overheats.

2459

From S. S. Matthews, Virginia.—I have a Hupmobile 1917 car, purchased last August and have driven it about 3,500 miles. It seems to be impossible to prevent it from overheating when driving it at speeds from 50 to 60 miles per hour for three or four hours. At the end of that time the water is hot and often boiling. Though I keep plenty of oil in the reservoir the trouble is continued. Can you help me in this matter?

Reply.—Your letter is a very surprising one and we are afraid we cannot give you any cure because of the fact that the Hupmobile was not designed to be operated for three or four hours at a speed of from fifty to sixty miles per hour. We doubt very much if you will be able to prevent overheating at these speeds for the very reason that the engine is being raced continually, so to speak.

If you intend to operate this car at this speed, we should advise you to put in a special gear ratio in the rear axle. If you will stop and think for a few

Digitized by Google

minutes, you will see that you are expecting a great deal from the car.

An automobile is subjected to many things. In the first place, the manufacturers must design the cooling system so that it will be effectual on the hottest summer day while the engine is being operated and the car stationary. Then again the water must not be cooled below a certain temperature, for if it were, during the low temperature in the winter the water would be frozen even while the engine was being operated. So you see the machine must be designed for average work. As soon as you speed it up to or above fifty miles, the radiating system is not efficient. This system cannot be made efficient for both summer and winter at both high and low speeds.

You might be able to prevent excessive heating by the installation of a larger fan—a larger radiator, or an auxiliary tank of water for the radiating system. We do not know of such a fitting on the market, but any tinsmith should be able to make an extra tank, which may be placed under the seat and connected with the radiating system.

Knock in Oakland Car.

2460

From C. H. Simpson, Iowa.—I have an Oakland Model 34 that has been run about 3,000 miles without the least bit of trouble. Lately I have noticed a knock in the engine which seems to come from the third cylinder. I have tightened up all of the connecting rods yet the knock still persists. When the engine is running slow and idling, it is sort of a rolling knock, but when the engine is pulling hard the knock is sharp. There is no carbon in the cylinders, the compression is good, and the push rods all adjusted. Will you describe the sound of different knocks in an engine and give the various causes? Would difference in compression cause a knock?

Reply.—You have asked us for an almost impossible reply, for the very reason that an engine knock is often difficult to locate even by an experienced repair man who can see the engine and examine it carefully. The best that we can do for you is to give you some advice as to how you can find such a knock.

A loose connecting rod will give a sharp knock while the engine is being forced up a hill or put to a considerable strain. Oftentimes a loose connecting rod will knock even in ordinary engine operation. That depends, of course, entirely upon how loose it is. At any rate, the knock will be more noticeable as the load is applied. A wrist pin knock is nowhere as nearly as heavy and has a more metallic sound. A carbon knock is noticeable while the engine is undergoing considerable strain and is really a dull thud which is the same as would be had by pounding two heavy books together. A knock caused by preignition or a spark advanced too far sounds about the same. A sharp knock, but considerably heavier, is had when either of the main bearings are loose. A loose flywheel gives a similar result. In both of the latter cases the knock is more evident while the engine is running idly. While the engine is under a strain the flywheel knock frequently ceases.

Very frequently a knock in the clutch or transmission seems to come from the engine itself, and about the only way to really locate a knock of this sort is by means of a special device used by repairmen.

The writer has frequently tried the following method, but it has its drawbacks if one is not particularly careful. Take a stick of wood about one-half inch in diameter and twelve inches long, and point it as you would a pencil. Place the point against the various bearings and parts of the engine and put the other end between your teeth. With a little practice you will be able to localize the vibration and the knocks.

Unless the compression in one of the cylinders varies at least two pounds or more, this will not be apt to cause a knock.

Compression Trouble.

2461

From Everett Lindsay, Colorado.—I have a 1914 Model Ford car which is equipped with an engine practically new. The engine, however, knocks when running. When the last cylinder is shorted out, the knock stops. A number of repair men have tried to find the trouble but have failed.

Reply.—As you describe your trouble, we are inclined to believe that it is due to excessive compression. Make a test of all four cylinders and compare the compression in each cylinder with that in the others. The compression the modern Ford gasoline engine should average between forty and forty-five pounds per square inch. Should it be higher than this, a knock is apt to result. The practical way of reducing this compression is to replace the present cylinder head with a new one of a later design.

Vim Truck Question.

2462

From R. L. Brumbaugh, Pennsylvania.—I have a Vim truck, 1917 Model, and the lights do not work. Please advise me if the generator is the unit in back of the fan? Does this have any connection with the magneto? Can the wiring be attached direct to the magneto, or would you advise some other lighting system? What system would you advise?

Reply.—The generator on this engine is operated by the fan shaft, and the current is generated through the coils on the holder in back of the fan. This unit has no connections with the Dixie magneto. We would not advise you to change this lighting system, and should advise you to see a service station, for the present generator should give you good results.

If you have been having trouble with the lighting system, we would advise you to go over all of the wiring, being sure that all of the connections are tight and that the insulation on the wires is unbroken.

Examine the brush contacts on the generator and be sure that they contact with the commutator. We would not advise you to make any alterations on this unit without consulting a service station.

Maxwell Compression.

2463

From W. M. Schwingel, New York.—Acting upon a suggestion found in your trouble department, I have tested my four cylinder Maxwell engine which is three years old and find that all cylinders show about 45 pounds pressure per square inch. Is this considered enough? Can I make a gauge so that I can measure the explosive pressure? I have arranged a 150-pound gauge in the shell of an old spark

Digitized by Google

plug but it will short-circuit if I attach the ignition wire to it.

Reply.—The compression of 45 pounds is a very good average for this car and you will probably get better results with this low compression than you would if it were higher because of the fact that the average car today has much less compression than it did a few years ago.

There is no practical method of measuring the explosive pressure and if you were to find this pressure, it would indicate nothing. Your method of fastening the pressure gauge in the shell of an old spark plug is very practical for obtaining the pressure figures under ordinary conditions, but cannot be used in conjunction with the ignition system for the very reason that a wire attached to it would short-circuit through the plug to the engine. The only practical method of obtaining the compression at the time of explosive would be to attach the pressure gauge to one of the petcocks and use the spark plug in its regular place.

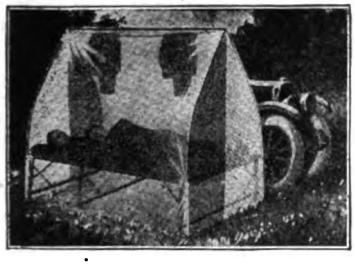
Flooded Magneto.

2464

From J. C. Brown, West Virginia.—I am having trouble with a Dixie magneto which has been flooded with water. The coils have been baked out and tested and seems to give current when tested with a storage battery, however it will not generate its own current. Can you tell me what the matter is?

Reply.—Either the primary coil has been short-circuited or the water corroded the connections to this coil. The only thing that we can advise you to do is to take the magneto apart and make a test of all the coils, replacing with new such as are found to be at fault. If you do not feel qualified to test the magneto yourself, we would advise you to return it to the factory. Baking the coils will probably do no good as the damage has already been done.

NEW AND INTERESTING THINGS IN MOTORDOM



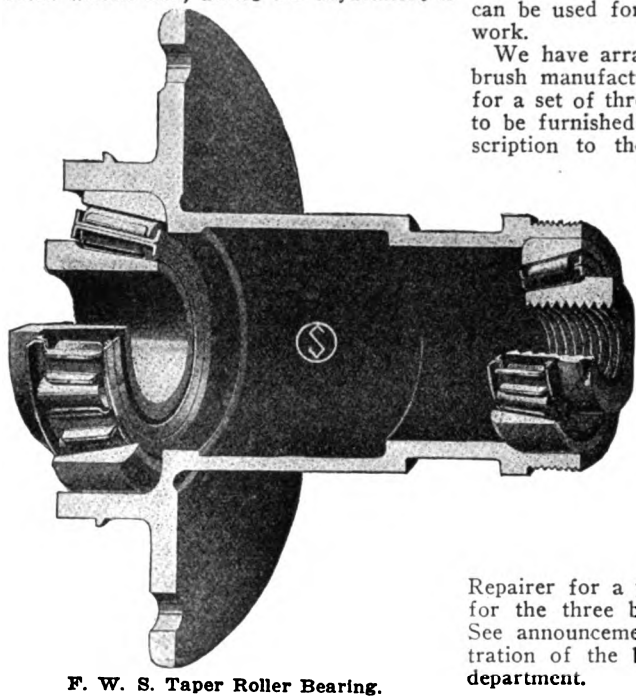
Rayfield Carburetors.

We have told our subscribers, repeatedly, to do their part in conserving fuel, and it is almost impossible to get full efficiency from an automobile fitted with an old style carburetor.

Carburetors five or six years old are seldom efficient when used with present day fuels. Many drivers are not satisfied with their present equipment and we would suggest that they investigate the line of carburetors manufactured by Findeisen & Kropf Manufacturing Co., 21st and Rockwell Streets, Chicago, Ill. These carburetors are designed by experts who are familiar with fuel requirements of today and are made according to the latest design.

The Tentobed.

The Traveling autoist who desires a camping equipment of minimum weight should investigate the Tentobed bed manufactured by the Tentobed Co., 3422-3426 West Lake Street, Chicago, Ill. The whole outfit weighs but 45 pounds and rolls into an extremely small space. The tent is made of heavy drill treated by a special process which makes it absolutely waterproof and mildewproof. The bed is large enough to accommodate two people and is strongly constructed. The complete outfit is covered by a dust and rainproof carrying case. It may be obtained in three styles and any of our subscribers intending to go upon a camping trip should investigate this product.



The Tentobed.

Subscribe to the "Automobile Dealer and Repairer," $1.00 Per Year.

F. W. S. Taper Roller Bearings.

Many car owners are dissatisfied with the front wheel equipment of their Ford or Chevrolet 490 cars. Both of these machines are fitted with ball-bearings in the front wheels and, unless the adjustment is very carefully made and maintained, considerable trouble results. The Bearings Shop of 1402 Michigan Avenue, Chicago, Ill., are putting out a product, termed the F. W. S. Taper Roller Bearing, a device which is interchangeable with either Ford or Chevrolet 490 front wheel bearings. As the name indicates, these bearings are of the roller type and are said to be very efficient.

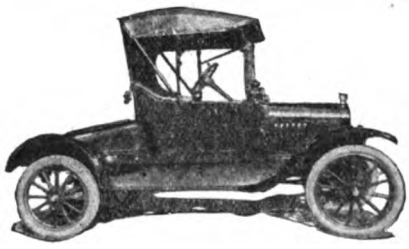
F. W. S. Taper Roller Bearing.

Something About Brushes.

As many of our readers at different times have had occasion to use paint and varnish brushes in connection with their automobiles, the question of brushes becomes a rather important one. Ordinarily, of course, most people see no difference between one brush and another, but there is an amazing difference. One will shed its hair to such an extent that a good job of either painting or varnishing cannot be done with it, while another and a properly constructed brush can be used for a long time and do good work.

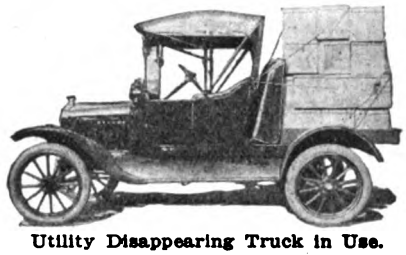
We have arranged with one of the best brush manufacturers in the United States for a set of three paint or varnish brushes to be furnished in connection with a subscription to the Automobile Dealer and Repairer for a year for the sum of $2.00 for the three brushes and the magazine. See announcement together with an illustration of the brushes in our advertising department.

Tire Rebuilding Stand.



Tire Rebuilding Stand.

The Williams factory and Machine Company of Akron, Ohio, have recently designed a stand for tire repair shop use. This stand is made especially for shops which do retread work or make sectional repairs, and is built upon the same lines of the stands used for hand operations in tire factories. Unlike the latter, however, it takes up a minimum of floor space and is very light in weight without sacrificing convenience or strength. Another feature is the spring ratchet attachment which permits the turning of the tire either way at will, or locking rigidly in any desired position.



Digitized by Google

Utility Disappearing Truck.

A device has recently been placed upon the market by the Hill Pump Valve Co., 22nd Street and Canal, Chicago, Ill., which

Utility Disappearing Truck Closed.

Utility Disappearing Truck in Use.

is known as the Utility Disappearing Truck and has been designed especially for the Ford Roadster car. It makes possible the use of this car as a half-ton truck upon which may be carried coal, groceries, milk or other commodities; or it may be used for carrying additional passengers. When not in use, the body slides beneath the front seat entirely out of sight, beneath the turtle back of the machine. To change from passenger car to truck, only two seconds are necessary. The turtle back of the Ford car is lifted and the truck body is pulled out to the desired length. The turtle back when lifted rests against the back of the front seat and prevents it from being scratched or marred. The price is extremely low and as it evidently is of such great utility we should advise all of our Ford owner readers to investigate.

An Addition to Their Plant.

To meet the constantly increasing demand for its product and particularly to care for the requirements imposed by the war, the Metal Hose & Tubing Company, Brooklyn, N. Y., makers of Triplex Gasoline Hose, have started construction on an addition to its plant. The building is of permanent construction in brick. The new space will give 5,000 square feet more for manufacturing purposes and the factory will immediately require all of it.

The Vacuum Muffler.

A device which is attracting considerable attention at the present time is being sold by the Vacuum Muffler Corporation, 154 Nassau Street, New York, N. Y., and known as the Vacuum Muffler. This device consists of two light castings which have upon their inner sides a number of fins which extend outward from a common center. The manufacturers claim that this manifold is thoroughly efficient because of the fact that it does not hold back the gases. It allows a practical discharge through the manifold. The explosion force of the discharge is deflected against a central projection and broken up into numerous small discharges, each of which is separably and evenly expanded to atmospheric pressure and delivered to the atmosphere through the various passages between the fins with hardly any noise.

Imperial Welding Catalog.

The Imperial Brass Mfg. Co., 520 South Racine Street, Chicago, Ill., have issued their latest catalog No. 142, in which is described in detail the full line of Imperial Welding and Cutting Equipment as well as the Imperial Lead Burning Outfits. In this catalog the history of welding and cutting is reviewed and its relation to the model industries is taken up. All of the various industries which utilize the oxy-acetylene welding and cutting apparatus are illustrated and a detailed account is given of the many ways in which welding devices may be utilized. Every reader who is interested in the possibilities of welding or who intends purchasing welding or cutting apparatus or who does storage battery repair work should send for this catalog.

Rico Accessories.

The Rich Manufacturing Co., 1777 Broadway, New York City, are putting out an interesting line of automobile accessories. They issue a small illustrated leaflet which should be in the hands of every automobile owner. This leaflet tells about some of the lines which they market. They show a number of different styles of washing brushes as well as various types of upholstery and cushion brushes and dusters. Special brushes are marketed for wheels and spokes, making a very complete line, altogether. They also illustrate a number of styles of rubber pedal pads, and adjustable foot rests, together with a patented extension pedal said to be the only pedal of its kind now upon the market. The reader's attention is also called to a practical mat for the running board which is easy to clean and may be removed very quickly when not in use.

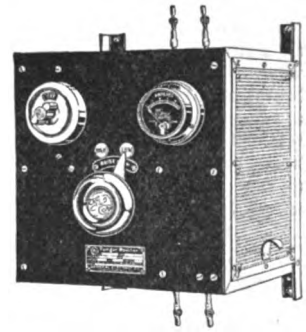
Acme Automobile Jack.

No automobilist looks forward to tire or car repairs with any degree of pleasure, but at the same time he should be prepared for anything that might happen in this line. He can eliminate some of the trouble by providing himself with a suitable car jack and he can eliminate still more by purchasing a jack fitted with a long handle which eliminates the necessity of crawling beneath the car to put the jack in place.

Such a jack is manufactured by I. S. Spencer's Sons, Inc., Guilford, Conn. This product is termed the Acme Automobile Jack and is provided with a handle which extends 35 inches from the jack. The handle is so arranged that the whole device

Acme Automobile Jack.

may be folded to 18 inches. The jack is designed to lift with ease the heaviest car. All of the moving parts run in heavy grease and are completely covered. The weight of the car is supported upon ten ½-inch ball-bearings.



Preventing Grease Leakage.

Many Ford owners are troubled by the leakage of grease from the rear axle housing of their car upon the brake bands, the wheels and the tires. This not only gives an unsightly appearance to the car, but also tends to reduce the braking efficiency. It also wastes grease and now that the country is trying to save, every autoist should do his utmost to prevent any waste of material.

The Shurnuff Mfg. Co., Department D, St. Louis, Mo., manufacture a device which may be placed in the Ford rear axle to prevent the escape of grease. This device consists of three extra high-grade felt washers, one rubber-asbestos washer, retained by proper rings in a steel cup. The felt and rubber washers hug around the axle and press against the housing in such a way that no grease can escape from the differential into the housing. The price is extremely low and the device is well worth investigating either by dealers or car owners.

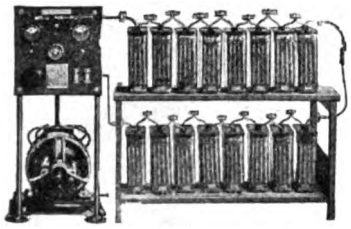
Tungar Rectifier.

Anyone who intends to charge storage batteries either for themselves in their private garage or for the public in general should investigate the Tungar rectifier manufactured by the General Electric Company, of Schenectady, New York. This

Tungar Rectifier.

device is very compact and easily managed by even the most inexperienced electrician, and is designed for attachment to alternating current lines. The device automatically changes the alternating current to direct, so that one may use it for charging batteries.

Moore Auxiliary Transmission.



A device which should be of great interest to the Ford car owner is the Moore auxiliary transmission, manufactured by the Tractor Train Company, Los Angeles, California.

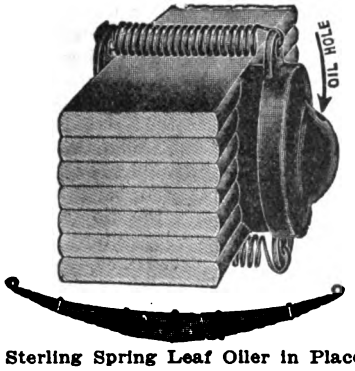
This transmission is designed especially for Ford cars which have been fitted with heavy or commercial bodies and provides an extra set of gears which when used in conjunction with the regular Ford gear box gives an intermediate speed and a ratio lower than the regular low speed, as well as a ratio lower than the regular reverse. In other words, this transmission provides a lower ratio beneath all three of the regular Ford speeds. Trucks which cannot be driven over rough or hilly roads on high speed may often be driven on the intermediate, which is had by the application of the Moore transmission. The device is fastened to the Ford rear axle and requires a slight alteration to the propeller shaft mechanism. All necessary parts for alteration are furnished with the transmission which may be applied by anyone accustomed to the use of tools.

Digitized by Google

Electric Lighting Plant.

Many garages, machine shops and firms are situated far away from electric lighting systems and it is for these people that the Mayhew Electric Lighting plant manufac-

Electric Lighting Plant.



tured by the Mayhew Co., 880 31st Street, Milwaukee, Wisconsin, has been designed. This plant consists of a generator which may be driven from a gasoline engine or any other source of power, a switchboard and a battery of storage cells. The plant is complete in itself and requires a minimum amount of attention. The current generated may be used for lighting or operating farm machinery or in garages for charging storage batteries. Dealers should investigate this proposition for it holds many opportunities. The manufacturers make a special proposition for dealers and jobbers.

A. & H. Vale Tools.

A. & H. Valve Manufacturing Co., Inc., 505-507 West 45th Street, New York City, are putting on the market two valve tools which should be of infinite value to the car owner as well as to the automobile repair man. These tools are designed in such a way that practically any tire valve repair may be made with them. They may be used for removing broken plungers, for recutting both the inside and the outside plunger threads and for removing plungers. They are extremely compact and each tool is designed for a number of operations. The price is so low that one can hardly afford to be without them.

Sterling Spring Leaf Oiler.

In this issue we publish a story dealing with the care and maintenance of automobile springs and the reader will notice that we place special emphasis upon the necessity of proper lubrication, for springs are an important part of the car equipment. We want to call the attention of our readers to the Sterling Spring Leaf Oilers made by the Sterling Mfg. Co., 321 Frankfort Avenue, Cleveland, Ohio, which seem to be very practical and efficient. This device may be attached to the car springs and act entirely

A Sterling Spring Leaf Oiler in Place.

automatically. A frequent filling of the oil reservoir in the device is all that is required once the springs have been cleaned. The oiler consists of a circular metal cover which contains an absorbent material. This cover is retained in place by an oblong locking plate and two small coil springs. The cover forms the reservoir for the oil and this oil is distributed to the various spring leaves by the absorbent material.

Automobile Blue Books.

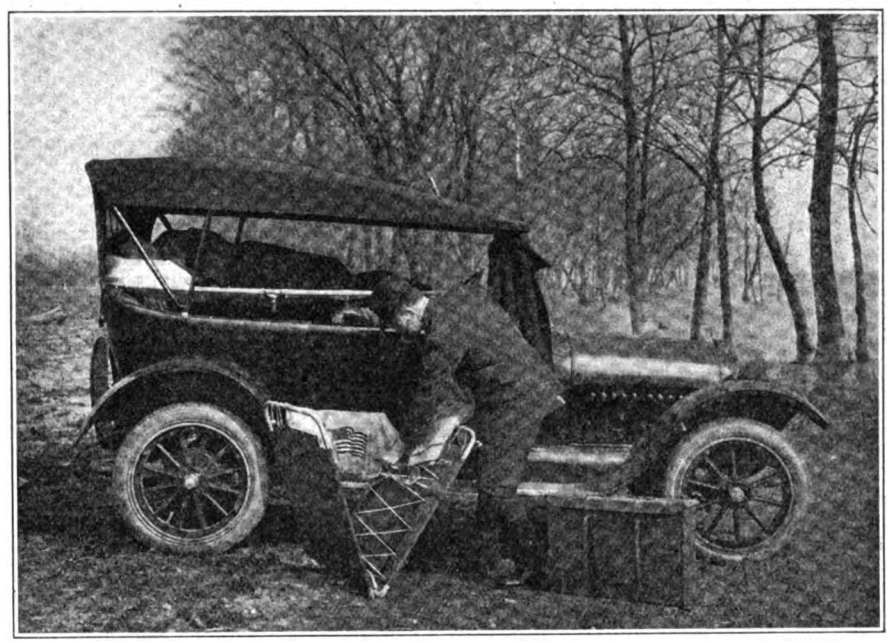
The 1918 volumes of the Automobile Blue Books are now ready for distribution. These books may be obtained from the publishers or from *Motor Life*, 243 West 39th Stret, New York, N. Y.

A new volume has been added to the series, bringing the total number to eleven. Approximately 415,000 miles of road are covered in detail, together with charts and maps, and every motorist who intends taking his vacation in his machine should have the Blue Book covering that particular territory through which he intends to travel.

A New Factory.

On May 1st, the Dearborn Truck Co. moved into new and larger quarters at 1215-25 West 35th Street, Chicago, Ill. This is a new plant found necessary because of the increased demand for Dearborn truck units. The new property has a frontage of 133 feet and a depth of 455 feet, giving a ground space of approximately 60,000 square feet. All modern machinery has been installed as well as the sprinkler system for fire protection.

Superford Radiators.



The Superior Lamp Manufacturing Co., of 136 West 52nd Street, New York City, are marketing a radiator for the Ford passenger and commercial cars known as the Superford Honeycomb radiator. These radiators are made with extraordinary skill and care. The inner units are constructed of brass and copper and no steel or sheet iron metal is used. The Honeycomb core is of the same type and design as that used in the Packard car radiator. This radiator is two and one-half inches deep and thus the effective cooling area is much more efficient than that of the ordinary Ford. These radiators are built in two styles, No. 16 (F) is designed to fit Ford cars made in the years from 1909-1912, inclusive. Model No. 18 (F) is designed to fit the 1917-1918 model Ford cars. A special feature of both types is the detachable casings which may be removed should the occasion arise, thus making them of two unit construction.

Samples of these radiators will be shipped to interested jobbers and dealers and we should advise our readers to investigate this type of radiator.

Any Kar-Auto Kot.

The automobile is being used more and more for travelling. The above cut shows the Any Kar-Auto Kot which is manufactured by the Peoria Auto Kot Co., Peoria, Ill. This kot is said to be one of the simplest and most comfortable and inexpensive beds that tourists can carry with them. The kot rests over the tops of the backs of the rear and front seats. One or two can be placed into any five or seven passenger automobile and when the curtains are drawn one is protected from all kinds of weather.

The kot is made of half-inch, galvanized tubing and is six feet long and two feet wide and is hinged in the middle, folding to a small package. It is furnished with a heavy ducking which is laced on the underside. In a few nights out one will save the price of this kot on hotel bills alone. There is no extra work after the kot is once fitted to a car. The bed can be made up ready for sleeping in one minute. The weight of the kot is 15 pounds.

An Any Kar-Auto Kot in Use.

It is said that never before has there been anything along this line that is so simple and practical as the Any Kar-Auto Kot.

Hall Voucher Check.

The garage man cannot afford to waste much time in attending to accounts and very frequently he does not employ any bookkeeper. For this reason he is often put to much trouble in settling various accounts. To prevent such trouble the J. C. Hall Co. of 71 West Exchange Street, Providence, R. I., have designed a voucher check which seems to be of great interest. This check is similar to the ordinary bank check inasmuch as it has the name of the bank, the firm, and space for the amount and payee; but in addition to this it has printed upon its face at one side, space for

Digitized by Google

details of the transaction. For different kinds of business the form may be had in different styles, the feature being the blank for itemized figures. Again such a system of taking care of bills is convenient because return checks may be filed in a minimum amount of room and are always convenient for reference. Many firms make a practice of destroying large and bulky bills as soon as they have been paid and using for receipts only the checks returned from the bank. In this way the extreme cost of many filing cabinets is eliminated. The checks may be had in a number of colors printed either upon bond paper or national safety paper. Dealers and garage men should investigate this system.

Rain-A-Way Pad.

A very handy and ingenious accessory is announced by the Badger Manufacturing Corporation of Milwaukee, Wisconsin. This firm was formerly known as the Auto Parts Mfg. Co., and carry a complete line of bumpers, steering wheels, tire carriers and other accessories.

The Rain-A-Way Pad is a small felt pad which is treated with a special solution, and when rubbed over the windshield prevents rain or moisture from blurring the vision.

Rain-A-Way Pad.

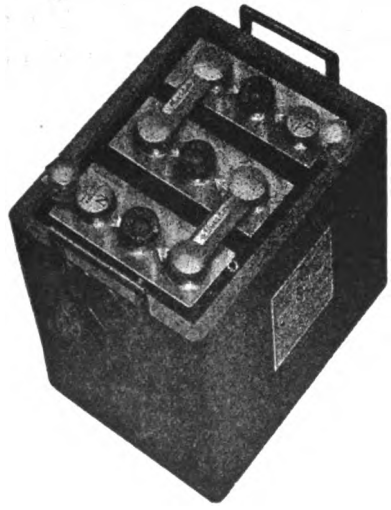
It also prevents mist from collecting upon the shield. The pad leaves an invisible film on the glass and this film is said to shed water like a duck's back. If the pad is applied just before it begins to rain it is claimed that the rain drops positively will not collect. Mist or fog are also kept from gathering even on the coldest days. The pad is not greasy, neither does the preparation on the pad evaporate. It may be slipped into one of the side pockets of the car and is always ready for use.

Readers are invited to send for a sample pad.

The 'Official Garage" System.

The "Official Garage" System of the Chicago Motor Club presents an opportunity for the progressive dealer to secure a volume of tourists' trade, season after season. The Chicago Motor Club located at Michigan Boulevard on 29th Street, Chicago, Ill., has a membership of 5,000 automobile owners, and members are furnished with general touring information, together with names of garages and service stations where they may expect rapid service and fair treatment. The motorist is warned not to patronize garages that do not conform with the laws of the club. This club prints each month in their journal "Motor News" a list of official garages, and these garages are required to pay a membership fee of $7.00 together with a sign rental of $12.00 a year. Should any of the garages charge exorbitant prices, their contracts are automatically canceled. The whole plan is co-operative and is designed to protect both the garageman and the traveling autoist.

The Revere Motor Car.



The Revere Motor Corporation, 1638 Monadnock Block, Chicago, Ill., are manufacturing The Revere Motor Car, which is a particularly attractive appearing machine. This chassis is fitted with a Dusenberg racing type four-cylinder engine which develops 103 h.p. The cylinders are all gray iron and aluminum and are cast in block. Aluminum is used in every case where it is possible. All parts of the engine are carefully finished and reciprocating parts are carefully balanced. A pressure feed and splash oiling system is used and cooling is had through a honeycomb type of radiator mounted in an aluminum shell. The body is very attractive and it is designed for speed purposes. Wire or wood wheels may be had, and an extra wheel is mounted on the forward end of the car.

Marko Batteries.

The ordinary storage battery is always a black box of mystery to the car owner as well as many garage and repair men. This need not be so any longer if one purchases a Marko storage battery made by Paul M. Marko & Co., 1191 Bedford Avenue, Brooklyn, N. Y.

This storage battery is extremely interesting because of the fact that the cell covers instead of being made of rubber or composition are made of glass. At a glance, the owner can see the condition inside the cell. He can see how the plates are arranged as well as their condition. He can tell immediately without removing the vent plugs whether distilled water is needed or not. Red arrow indicators project inward from the terminal posts and these indicate the exact level to which the electrolyte should rise in the cell.

Another argument in favor of this battery is that the glass may be kept clean easily by wiping it across with a soft cloth. Internally the construction is somewhat similar to the ordinary type of storage battery. The plates in the Marko cell are composed of pure alloy grid and a paste of selected grade of oxides of lead. The active

Marko Battery.

material is closely bound into place, is relatively hard, yet extremely porous.

The manufacturers claim that Marko plates retain their voltage in heavy discharge and have a longer life as well as a greater capacity than any other plates manufactured.

Raydex Lens.

A unique product is being marketed by the firm known as Raydex, Jamestown, N. Y., which has been termed as the glassless lens. This device is described as being an all-metal cellular device that is placed in the upper half of the head-lamp behind the regular glass door. The reflexor contains more than 9,000 small metal

Raydex Lens.

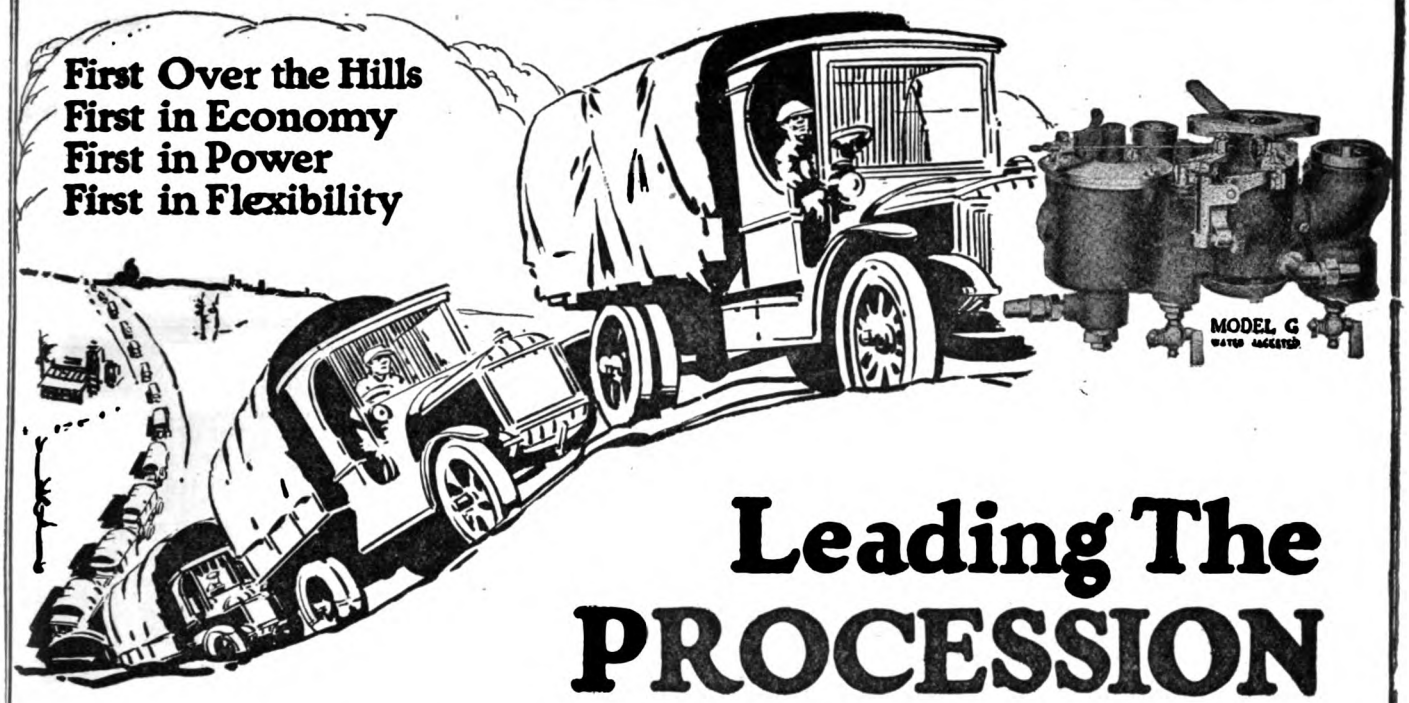
reflectors or approximately nine square feet of highly polished reflecting surface. When the light of the lamp beams through the Raydex, the device closely resembles a glass lens molded into thousands of tiny figurations. Its object is to deflect those rays which normally rise above the 42-inch level and cause glare and to project them instead upon the roadway where they are wanted. The principle of construction of the Raydex is said to make it transmit 93% of the headlamps candle power according to illuminometer test. It is said that it not only banishes all glare but prevents the lamp from projecting rays above the legal limit.

Klaxon Horns.

We want to call the attention of our readers to the big line of Klaxon horns being manufactured by the Klaxon Company of Newark, N. J. This line includes warning signals suitable for all kinds of cars. They are made in many types either for hand operation or for operation with the storage battery or dry cells. These horns are sturdily made, dependable and trouble-proof, and are within the reach of practically any automobilist's pocketbook.

Mohair Top Dressing.

Very few motorists realize the care which should be used in selecting dressings or polishes for use on the fine finish of a car.



For instance, if a black liquid, put up in a container labeled "Mohair Top Dressing" is purchased, and it gives a uniform black appearance on the top after applying, the average car owner is satisfied that the job is done right, and thinks no more about it.

If, a month or two later, he is caught in a rain storm and the water begins to soak through the top, the usual thought which occurs to him is that the makers of the top should be subjected to some condign punishment for using such poor material, while, if he only knew the facts, his irritation would be directed to what is probably the real source of his trouble.

Mohair cloth is made of two layers of fabric, the outside and the lining. These two are held together by a thin layer of flexible rubber composition. Neither the outside fabric nor the lining is waterproof. The thin rubber insert is all that keeps the water out. Once this becomes porous, the top loses its waterproof qualities, and might just as well be discarded.

It is strange that manufacturers of dressings for mohair tops do not realize that the dressings they offer should be so made as not to injure the fabric as well as to improve the appearance of the top. Yet

Leading The PROCESSION

SUPREME QUALITY has put the Rayfield Carburetor far in the lead—and maintenance of that quality keeps it there. The Rayfield is *the* "war carburetor." It conserves 30 to 50 per cent more gasolene than any other make. Ask one hundred interested people which they consider the greatest of all carburetors. A big majority will unhesitatingly answer—"the

RAYFIELD CARBURETOR

"The World's Best"

The New Rayfield Special for Ford Cars is the carburetor that gives satisfaction regardless of the going. Whether on hills, in sand or mud, the Rayfield produces the gas in just the right mixture to insure perfect motor performance. A Rayfield under the hood means that you'll "go over the top."

The New Rayfield Thermostat insures the proper temperature for best motor performance under all weather conditions. Quickly installed as a permanent part of the circulating system, it makes any automobile an all year around, efficient car. Write today for full description.

many dressings for Mohair Tops contain some solvent which will attack or dissolve rubber. Benzine, alcohol, turpentine, gasoline, or various oils are used as solvents

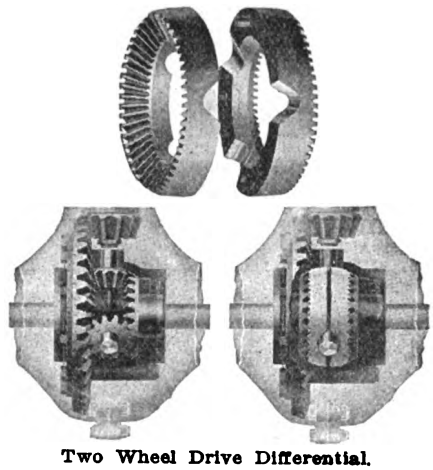
Mohair Top Dressing.

for dressings, all of which will attack rubber. When a dressing, containing one of these ingredients, is applied to a mohair top, the solvent soaks down to the rubber insert and is held in contact with it by the fabric which absorbs a considerable amount.

Even though the dressing dries on the outside, that part next to the rubber insert dries more slowly and unites chemically with the rubber composition. Under the action of some solvents, the rubber insert becomes soft and it pulls away. Others will destroy the elasticity, making it brittle. Then, as soon as the top is folded, it cracks along the lines of the folds, making holes for the rain to enter.

The Frank Miller Company of 349 West 26th Street, New York, has taken this situation carefully into consideration in originating and developing the formula for Frank Miller's Mohair Top Dressing. They claim that they use no materials whatever in its composition which will attack the rubber insert or injure the fabric. It is difficult to produce a dressing of good finish without using some material of questionable action, but Frank Miller's chemist seems to have solved the problem and produced a dressing which, with a single coat, gives a wonderful, soft, silky lustre like new black mohair cloth. This dressing does not fill up the grain of the fabric like a varnish, but retains all its original qualities. It is also lasting and does not require constant reapplication. It is applied easily with a brush. One quart, if properly used, is sufficient to dress a complete top and side curtains of the average size.

Garco Data Booklets.



The multitude of different cars on the market and the consequent variations of size in brake lining needed for renewals has been successfully answered in a booklet just published by General Asbestos & Rubber Company of Charleston, S. C. manufacturer of "Garco" Brake Lining.

Listed in this booklet is the name of practically every passenger and commercial vehicle manufactured. The different models of each are listed by year or number. As it now stands the data given regarding the number of pieces of brake lining, the length, width and thickness needed for renewal, is thoroughly up-to-date and it is the intention of the Company to issue revisions from time to time as may be found necessary.

The Garco Brake Lining Data Booklet is of convenient size to be slipped into a vest pocket. It will be gladly sent free of charge to any dealer or repairman requesting a copy. A number of pages have been furnished blank for use in making memoranda and in all this booklet will be found of real, practical value to anyone interested in the brake lining renewal business.

Two Wheel Drive Differential.

The Lewis Differential Co. of 121 Huron Street, Milwaukee, Wisconsin, is beginning to manufacture the product known as the Badger Two Wheel Drive Differential, which they claim gives all of the advantages of the conventional differential, at the same time, however, overcomes all of its disadavntages. For instance, with the ordinary type of differential the power always passes to the wheel offering the least resistance. This is not true of the Badger differential, however, for in this case the power is transmitted to the wheel offering the greatest resistance. This means that the car is held absolutely steady and in line with the direction of the drive. It is said to give positive power when one wheel has traction in cases where the other wheel is upon a slippery surface or is travelling in sand or mud.

Two Wheel Drive Differential.

The installation is very simple and in the case of the Ford car, it is only necessary to take out the three pinion gears, replacing them with the Badger gears, using the same spider.

Anthony Rocker Dumping Body.

Our readers who are interested in special bodies for carrying sand, rock, coal ashes, etc., should investigate the Anthony Dump Rocker Dumping Body manufactured by the Anthony Co., Inc., Streator, Ill. These bodies are designed for application to Ford machines which have been adopted to carry loads of one ton or over. The body is automatic in action, the dumping being accomplished simply by releasing the latch. The centre of gravity of the load automatically consists in tipping the body backward. Upon disposal of the load, the body is instantly restored to the horizontal position. It is possible to arrest the body movement at any angle and hold the body in that position.

In the same manner the body movement may be so retarded that the final dump is accomplished easily and without excessive strain to any of the parts. In connection with this feature, road material, such as crushed rock, gravel, cinders, can be spread by holding the body at the proper angle and opening the tail-gate a certain amount. The full angle of dumping is greater than that secured in many bodies and varies from 48 to 50 degrees. For accomplishing any of the operations, the operator need not leave his seat. The body is well designed and the weight is ahead of the rear axle.

Standard Motor Pep.

A product has been brought out recently by the Utilities Co., Citizens Bldg., Cleveland, Ohio, which is claimed to energize gasoline. The manufacturers claim that when Motor Pep is used, car mileage is increased and the engine delivers 20% or more power than usual. This preparation is said to prevent the formation of carbon in the cylinders. It is put up in tablet form and dissolves readily in the gasoline, leaving no sediment. It is claimed that the preparation will not damage the carburetor, the cylinders, the valves, the tank, the pipe lines, or any part of the engine in any way. A special proposition is made to dealers, jobbers, garages, agents and anyone interested, who should write for samples. The product is guaranteed to produce results as claimed, or the money is refunded.

Helios Magnetic Lamp.

The Carbo Gas Co., Gardner Bldg., Toledo, Ohio, intend to put on the market, in the very near future, a product which is entirely new to the automobile industry. This product is termed "The Helios Magnetic Lamp," and is unlike any lamps now in use. The energy for lighting is derived from magnetism and the light is produced by a gas, instead of a filament, as in ordinary lamps. The device is very convenient and the Company expects to lease it at a nominal charge instead of selling it. The prices are low and the lights are refilled or recharged, as it is termed by the Company, who maintain all repairs at their own expense, charging only for the rental of the

Helios Magnetic Lamp.

device. The lamp lends itself to all sorts of lighting as well as automobile work and should be of great utility upon farms or in shops where electricity is not available.

Cork Insert

Transmission Lining For FORD CARS

—Stops the grabbing and slipping—the vibration and chattering.
—Requires less pressure on the pedal.
—Makes the Ford brake BRAKE.
—Saves the Ford rear end.
—Outwears several sets of ordinary linings.

$3 per set of 3

Keeps the Fan Fanning!
Cork Insert Fan Belt for Fords

The ordinary fan belt used with Fords is inefficient because of slippage—estimated at 25 to 50 per cent. Cork Insert Fan Belts stop this slipping—keep the fan turning with the speed of the engine—cut down the tendency to overheat. They retain their no-slip efficiency to the end of their long service.

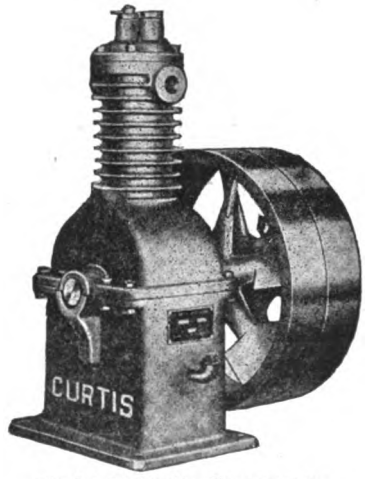
The D. & O. Anti-Wobbler.

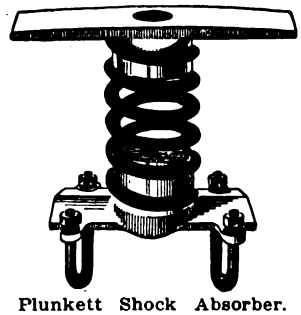


Many Ford car accidents are caused by the driver losing control of the car. This usually means that he is not strong enough to keep the front wheels in line or turn them in the direction in which he desires to go. The D. & O. Anti-Wobbler sold by the G. H. Dyer Co., 155 Brookline St., Cambridge, Mass., is said to eliminate this trouble. This device is said to make the Ford car steer as easily and as smoothly as any big car. It also prevents rattling of the tie rod. It consists of a large brake which is mounted upon the front axle, a large coil spring and a special pivot lock upon the tie rod.

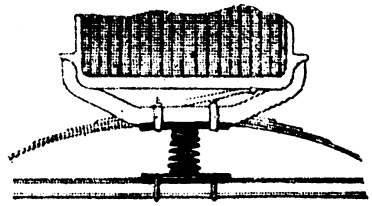
The D. & O. Anti-Wobbler.

Curtis Compressor.

We reproduce herewith a picture of the Model B Curtis Compressor, manufactured by the Curtis Pneumatic Machinery Co., Railway Exchange Bldg., St. Louis, Mo., a pump which is designed to be driven from any source of outside power by a belt. This model is fitted with a tight and loose pulley and so arranged that it may be started against full tank pressure without any danger of burning out the drive motor.



Model B Curtis Compressor.



The valves are prevented from dropping into the cylinders by a special safety device and may be inspected without removing the cylinder head. The cylinder may be removed without disconnecting any piping. While the device is amply lubricated by oil in the crank case, it is said that no oil can find its way into the storage tank. Anyone who intends to install air pressure machinery in the garage or service station should investigate the complete line of compressors, tanks, etc., manufactured by this company.

Plunkett Shock Absorber.

Every Ford car owner realizes that he may be caused considerable annoyance by the breaking of the front spring. Not only annoyance, but the breaking of a spring might mean the damage of the engine or the straining of other parts of the car, and for this reason he should do everything in his power to prevent such breakage. It is for this purpose that the Plunkett Shock Absorber has been designed. This device is made by the Plunkett Shock Absorber Co., 323-5-7 Washington Street, Brooklyn, N. Y., and is designed to be placed between the lower leaf of the front spring and the axle. Located in this position, the device absorbs the shock before it reaches the spring and also serves as a support for the central portion of the springs at the point where the greatest strain occurs. To a certain extent this device is an auxiliary spring. It prevents spring breakage caused by sudden dropping of the wheels, and it is said to add to the riding qualities of the car. The device is installed very easily and at the price, one can hardly afford to be without it.

Plunkett Shock Absorber.

Plunkett Shock Absorber Applied.

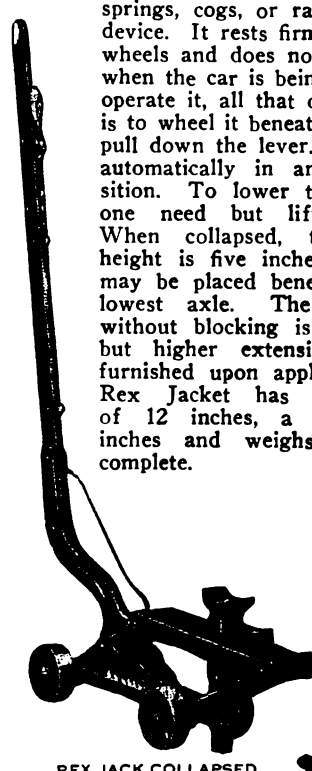
Six New Booklets.

Paint and Chemical manufacturers owned and controlled by the E. I. du Pont de Nemours & Co. of Wilmington, Del., have just issued six new and attractive booklets on the various products of their manufacture. These booklets may be had by writing this concern.

The first one gives a list of chemicals, etc., comprising the Blue Ribbon Line manufactured by the Company. It tells the trades and industries in which they are used and in many cases states how they are used. The second booklet describes the house and other paints manufactured, and includes a scale comprising the various color companies for use of house exteriors. The third booklet takes up the subject of Harrison Oil Stains.

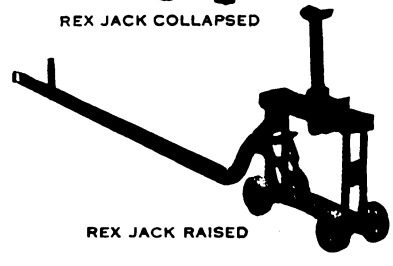
Other booklets take up the products known as Harrison Automobile and Carriage Paint, Harrison Porch Chair Enamel and various wood stains for different kinds of work.

Scored Cylinders.



It is quite possible that many automobile owners do not fully realize the true cause of so much of their engine trouble together with the corresponding loss of time and money which these troubles carry with them. The gasoline engine is no better than its cylinders and pistons. One of the two extremes is usually present in automobile engines. First the using of a very large amount of cylinder oil and gasoline; second, the using of very little cylinder oil, but a large quantity of gasoline. Both of these troubles may be traced to poorly fitting pistons or scored cylinders.

In many cases the scoring of cylinders can be traced to the leakage of gasoline past the pistons and the consequent dilution of the cylinder oil. As a general rule there is but one positive cure for the evil, and that is regrinding of the cylinders and the installation of over-size pistons.



Butler Mfg. Co. of Indianapolis, Indiana, have made a special study of this type of work and have made careful tabulations covering the proper compression and ring construction necessary for fitting, in reboring engine cylinders. They have standardized their prices and carry a large line of pistons, rings and other equipment in stock. They are equipped to regrind or rebore worn cylinders and restore the engine to its original efficiency.

Rex Automobile Jack.

The two illustrations show how the Rex jacket looks when it is in two positions, raised and collapsed. This device is made by the B. & M. Manufacturing Company, 5810-5814 Wood Street, Chicago, and is constructed of heavy material and said to be absolutely safe in operation. There are no springs, cogs, or ratchets in this device. It rests firmly upon four wheels and does not tip or sway when the car is being raised. To operate it, all that one has to do is to wheel it beneath the car and pull down the lever. It will lock automatically in any lifted position. To lower the car again one need but lift the lever. When collapsed, the extreme height is five inches, so that it may be placed beneath even the lowest axle. The higher lift without blocking is 20% inches but higher extensions may be furnished upon application. The Rex Jacket has a wheelbase of 12 inches, a width of 5 inches and weighs 47 pounds complete.

For Better SERVICE

For Quicker PROFITS

WEAVER UNIVERSAL Tire Changer

HANDLES OLD RUSTED TIRES AND RIMS AS EASILY AS NEW ONES

Make Your Garage or Vulcanizing Shop the Leader in Your Town

Install a Weaver Tire Changer and a Weaver Tire Spreader. Advertise the fact to your customers. Take them through the shop and **show** them these two efficient pieces of Weaver Garage Equipment in operation. And then tell them Weaver Equipment is what enables you to do their tire work BETTER, CHEAPER and QUICKER than anyone else can do it the old way.

Weaver Service of this kind you will find pays—BIG. It acts as a trade magnet. It gives the kind of hurry-up service that owners demand.

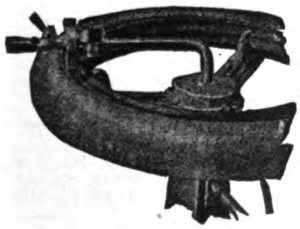
The Weaver Tire Changer saves work for your men. No more "fighting" for an hour or so with a rusty or battered rim.

No Injury to Tires or Rims

Your customers will also appreciate having their tires and rims handled by SMOOTH ROLLERS instead of with a sledge hammer and cold chisel.

Every operation is performed by rollers—there is no springing or "battering" of rims and no cutting or marring of tires.

Will Handle Any Rim



Any size or style of rim or pneumatic tire can be handled on this "Universal" Tire Changer. The adjustments are quick and simple. Weight 250 lbs., a REAL machine. The price will agreeably surprise you. Send for catalog of complete line.

"HOW TO WASH AUTOMOBILES"

Pocket edition booklet of valuable information to owners, chauffeurs, garage proprietors and their help. Free to those who write for it.

MURPHY VARNISH COMPANY
NEWARK CHICAGO

The Helix.

The Greenfield Tap and Die Corporation has just issued the first number of its new factory magazine, entitled "The Helix," a magazine which is printed for the benefit of the employees of the Company and will be published monthly. The first issue comprises 16 pages and contains many interesting shop notes together with a view of the factory and other illustrations. Mr. J. T. Seller, Secretary of the Corporation and head of the Welfare Department, is in charge of the paper, which has been greeted with a great deal of interest and enthusiasm by the members of the various factory branches.

New Woodworth Booklet.

A little book which should be in the hands of all of our readers is being distributed free of charge by the Woodworth Mfg. Corp. of Niagara Falls, New York. This 16-page booklet is entitled, "Motor Car Accessories Worth Knowing," and upon these pages are described the full Woodworth line, comprising the automobile tires and the well-known Woodworth steel studded leather tread, two products which have been on the market for several years and are well known to the trade. In addition to these there are illustrated many other accessories such as Easyon Non-Skid Chains for passenger and truck tires; Easyon Solid Tire Grip for trucks, Woodworth Spring covers and lubricators, Woodworth No-Stretch, No-Slip Fan Belts; tire boots, inner sleeves, and other items. We would advise all of our readers to write for this book for we feel that it would be money in their pockets to do so.

New Woodworth Booklet.

Gabriel Snubbers.

It is generally conceded that a car rides much easier when fitted with shock absorbers, and car owners are beginning to realize that shock absorbers not only make for comfort, but increase the life of the car. Owners who desire to install such devices upon their car may well consider the advisability of installing Gabriel Snubbers, manufactured by the Gabriel Manufacturing Co., 1411 East 40th Street, Cleveland, Ohio. These devices are designed to check the rebound and consist of a coil spring which automatically takes up the slack in a heavy belt attached to the axle. When the slack in the belt has been taken up the belt may be pulled out slowly from the device, but it is said to be impossible to pull the belt out quickly.

Form-A-Gasket.

A new gasket has appeared on the market that should prove of exceptional value to the trade. It is called Form-A-Gasket and is manufactured by the auto accessory firm of Constant A. Benoit, Brooklyn, N. Y.

Form-A-Gasket Container.

Permatex Form-A-Gasket is a gasket in paste form that can be smoothed-on with your finger. The manufacturers state it dries quickly, producing a solid layer of heat resisting material that will stand exceptionally high pressure and is gasoline, kerosene, oil and water-proof.

The manufacturers claim that Permatex Form-A-Gasket not only produces superior results on cylinder heads, carburetors, manifolds, crank cases, gear cases, and similar parts, but it saves much time in motor assembling, and saves much gasket material that otherwise is wasted.

Permatex Form-A-Gasket is offered in three sizes, ¼ pint, 1 pint and 1 quart cans. Attractive lithographed pasters, and four-color poster designs accompany all shipments. Write your jobber for prices, or direct to Constant A. Benoit, Brooklyn, N. Y.

Lyknu Polish.

The Lyknu Polish Manufacturing Company of Pittsburg, Pa., manufacture an automobile polish which is said to eliminate all kinds of grease and they also include in this category, elbow grease, for they claim that with Lyknu, the polishing of an automobile is made extremely easy. A piece of cheesecloth is moistened with this product and the surface is rubbed with a cloth until it is dry. This is said to bring back the original lustre of the finish and restore the appearance of the machine.

Hexall Products.

New machines are being added to the plant of R. F. Sedgley to meet the great demand for Hexall Ratchet and Socket Wrenches and Baby Hammerless Revolvers. Hexall wrenches are far behind on delivery owing to the increasing sales, and customers have been advised to place orders as far in advance of their need as possible.

Since the new patented one-piece main and trigger spring has been put in the Baby Hammerless the demand has steadily increased until it is no longer possible to keep customers supplied even with immediate requirements.

The new machines are designed to do many operations that are now being done by hand, and in this way will help out on the labor question as well as getting the articles mechanically perfect.

The Hexall Wrenches and Baby Hammerless revolvers are now being sold to the jobber on the Pacific Coast by McDonald & Linforth, 739 Call Building, San Francisco. The Gray-Heath Co., 1440 Michigan Avenue, Chicago, is distributing the wrenches along the Mississippi Valley.

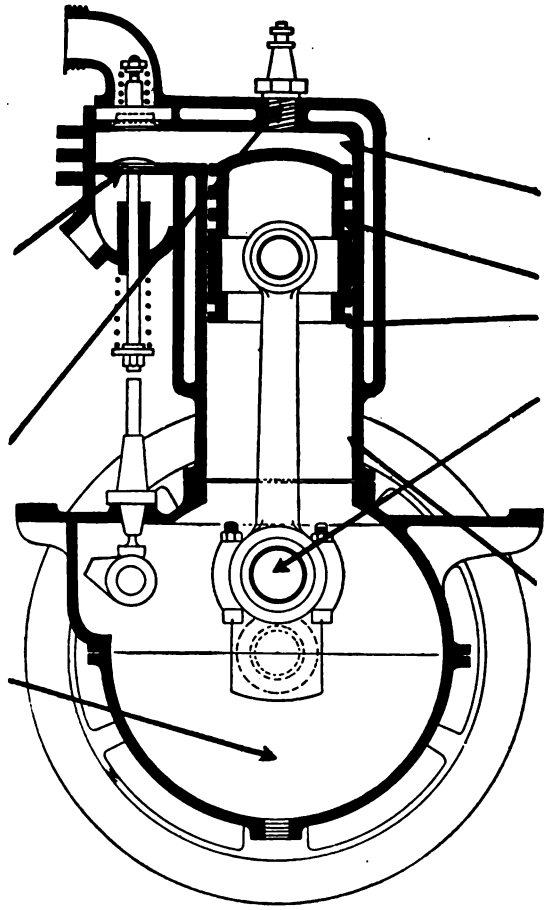
THE CURE



For Engines with These Symptoms

CARBON WEAR

Collection of carbon, not allowing valves to seat; also in combustion chamber, causing pre-ignition, loss of power, and a hot engine.

Fouled spark plugs cause skipping. Gasoline leaks into cylinder cutting lubricating qualities of oil, causes excessive wear.

Oil turns black from being burned, and does not give correct lubricating qualities.

Cylinders larger at the top and and out of round.

Compression and hot gases escape, burning oil, destroying life of piston rings and engine.

Excessive gasoline and oil consumed. Bearings do not stand up.

Dry and pin-scored cylinders are results.

The ReVere Motor Car

Designed by—

Gil. Anderson Adolph Monson and Tom Rooney—

DUESENBERG RACING TYPE MOTOR

ALL STANDARD BODY SIZES

SPECIFICATIONS—ReVere Chassis

ENGINE—Duesenberg Racing Type. Four-cylinder, 4⅜ in. bore, 6 inch stroke. Develops 103 H. P.

Cylinder—Gray iron and aluminum, cast en bloc.

Crankcase—Aluminum, crankshaft chrome nickel steel, finished all over, counter balanced.

Connecting Rods—Drop forged, heat treated chrome nickel.

Pistons—Special aluminum alloy. All integral moving parts hardened and ground; tungsten steel valves. Oiling system, pressure feed and splash.

Magneto—Bosch high tension.

Clutch—Multiple dry disc; discs faced with non-burn composition.

Starting and Lighting System—Electric Bijur.

TRANSMISSION—ReVere design. Four speeds forward and one reverse. Direct drive on fourth. Unit power plant.

Gears—Special alloy steel, hardened and ground on bearing surface; shafts on large ball bearings.

Transmission—Supported on three points, assuring absolute alignment of engine and transmission, drive to rear axle through two universal joints; torque taken up through two rods each side of propeller shaft.

REAR AXLE—Full floating type, spiral bevel gears.

FRONT AXLE—Special ReVere design, drop forged.

Knuckles—Extra heavy drop forged chrome nickel steel knuckles and steering connections, all tested to 100,000 pounds, elastic limit, all steering joints ball adjustable type, short turning radius.

FRAME—Special ReVere design front and rear kickup.

SPRINGS—Silico manganese special alloy steel, heat treated.

Front Springs—Semi-elliptic.

Rear Springs—Special ReVere design, very long, 58 inches long, 2½ inches wide with rebounding springs.

STEERING GEAR—Worm and gear type, all gears and shafts hardened and ground and adjustable for wear, in all directions. Special ReVere design spark and gas control.

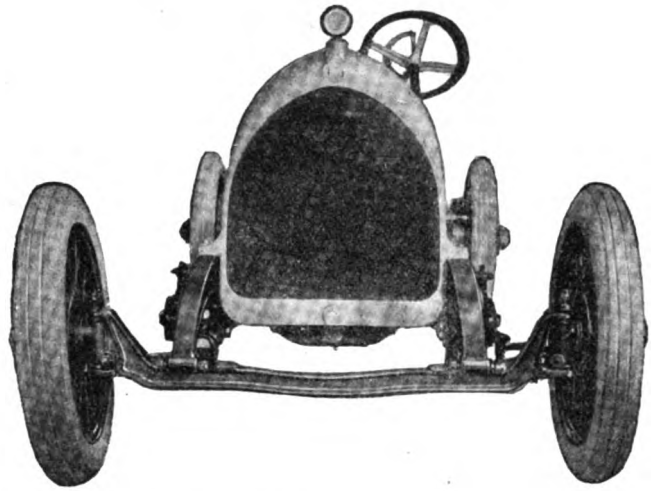
CARBURETOR—Miller or Stromberg.

RADIATOR—Exclusive ReVere design, honeycomb type, mounted in aluminum shell.

WHEELS—32x4½ wood or wire wheels. Tires 32x4½ Goodyear Cord.

WHEELBASE—130 inches

BODY—Speedsters, six-passenger Touring Car and four-passenger Sport Type.



Fully Equipped $3750—$3850 f. o. b. Logansport, Ind.

Strangling the Periodicals

CONGRESS at its last session passed a hasty postal law increasing the postage on periodicals from FIFTY TO NINE HUNDRED PER CENT THROUGH A POSTAL "ZONE" LAW. *The postal "zone" system was abolished by Abraham Lincoln in 1863 on the recommendation of Postmaster General Blair and has since also been condemned by U. S. Postal Commissions.*

Under the postal zone law some periodicals will be killed—all will be crippled. There will be fewer readers, and the habit of reading curtailed. The great functions of periodicals is to assist in the spread of ideas—by printing the achievments in the world of thought, culture, and science.

Thus to shut out farm journals—as these zone rates will—will lessen the productive power of our country by millions of dollars through loss of better methods. Shut off trade journals and you decrease the manufacturing power by more millions. Shut off the religious papers and there are shut off channels that have raised millions of dollars for distressed humanity. Shut off the great periodicals of the home and there is throttled an avenue that has given expert instruction to hundreds of thousands of mothers and saved their babies to health and citizenship.

These national periodicals are printed in the big cities—and the first zone, the cheapest zone, is in or near those cities; there are many educational opportunities near cities, and the cities will read anyway. Small towns and distant districts depend to a large extent upon periodicals; thus this law (increasing periodical postage where it is most needed) shuts off opportunity where needed. It penalizes periodical readers.

Congressman Claude Kitchen of North Carolina, who fathered it and compelled its adoption, refusing hearings on the measure,—it had been twice defeated by the Senate—stated in his speech in Congress that it was **not** a War Revenue amendment **but permanent postal legislation.**

Canadian magazine readers, even to the Arctic Circle, can receive American magazines at four cents a pound postage. Every American reader—if they live west of Missouri—**must pay almost twice as much postage, or from 4½ to 8 cents postage per pound for the same magazines!** This is what the postal "zone" law means—discrimination against American citizens of **all** Western States. Do you live West of Missouri—of Minnesota, Iowa, Arkansas or Louisiana? Then this postal "zone" law discriminates against you in favor of every Canadian reader to the shores of the Pacific and North to the Arctic Circle!

Will you help?—Sign NOW.

It is not a War Tax. It is postal legislation, pure and simple.

Repeal this law. Repeal this FIFTY TO NINE HUNDRED PER CENT periodical postage increase with its unfair, iniquitous and disastrous "zone" system. Sign the petition below and mail it. Put a cross mark in the square—save the periodicals and the work which they have done and are doing for national education and patriotism.

PETITION TO CONGRESS—Sign Here!

The spread of education, of culture, of scientific knowledge and advancement, and of our vast internal merchandising and manufacturing has been, and always is, vitally dependent upon the freest and cheapest circulation of periodicals. The penalties resulting from any restriction on the freest possible circulation of periodicals will be destructive of the best interests of our economic life and the opportunities of developing our best citizenship.

The postal amendment passed by the last Congress increasing the postage on periodicals from FIFTY TO NINE HUNDRED PER CENT with its postal "zone" system will throttle or destroy our periodicals at a time when the widest and most extensive circulation of publications is essential to the patriotism, education, and upbuilding of our country.

Therefore, I, the undersigned, do most earnestly demand the repeal of this burdensome periodical postage amendment.

Name .....

City or County .....

Street Address .....

State .....

Periodicals mean much in your life. If you will help by a few arguments with your acquaintances and an occasional letter to your Congressman in a spare moment, put a cross mark here.

☞ *Will you help in securing the repeal of this iniquitous law?* ☐

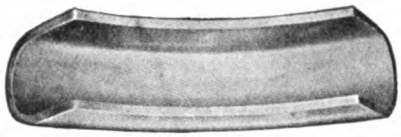
Do More Tire Repairing—At Less Expense



Akron-Williams

TIRE REPAIR EQUIPMENT

Used by All Leading Tire Companies

With this Tube Deflator you can get the air out of an inner tube in a jiffy. It is large enough to deflate any size tube, and small enough to put anywhere without taking up valuable shop space. **Price $4.50 F. O. B. Akron; 5% off for cash with order.**

Akron-Williams Solid Reducing Shells will fit into larger mold cavities, and enable the repairman to utilize **large** size molds for vulcanizing repairs on **small** casings whenever desired. Increase your capacity on small casings at nominal expense. ***Write for price list.***

Tire Re-Building Stand similar to those used in tire factories, but with improvements for repair-shop use.

Meet the increasing shortage of labor and the rising cost of doing business by using new Akron-Williams devices to turn out more and better work in less time. Fully described in new Catalog, brimful of everything for the tire repairman—send for it.

There is an Akron-Williams outfit for every size shop, and a machine or tool for every purpose in tire and tube repairing. No equipment is too large for us—no tools are too small.

And each and every piece is designed and perfected with the aid and co-operation of engineers employed by the large tire companies.

Prompt Shipments

With the completion of our large new factory, devoted wholly to building repair equipment, we are in position to make prompt shipment on all orders.

DON'T PAY BILLS TWICE!

Eliminate Disputes and Time-Wasting File Hunting

Have you ever met one of those old-time merchants or manufacturers—the kind who carry their books in their head and their bank in their pocket? Some of them made money in spite of their system but most of them lost a lot that they never knew they lost. They would have "gone broke" if they had not been frugal, for they ran business on the principle of "don't worry about what you don't know."

Yet the average man of to-day is almost as careless in some of his methods of doing business. In the matter of paying bills, for instance, how many men are there who have not had a dispute over a bill they've paid—and yet have had all sorts of trouble to get at the evidence to prove it. Here's a typical case:

Johnson had a number of irons in the fire. He conducted a garage, dabbled a little in contracting, and held a town office. One morning a letter was laid on his desk—with a bill for $110 for some coal he had bought through a local dealer from whom he also bought grain and lumber.

"I think we've paid that bill," said Johnson's bookkeeper.

"Paid it! Of course, we've paid it. I remember it myself. Get out the receipts and bring me the check-book."

And then the bookkeeper reported:

"I'm positive that we paid that bill for coal, but I can't find any receipt for it. It may have been mis-filed or mislaid."

With a growl about carelessness Johnson went through his check-book, but couldn't find any stub for $110. But finally he found the stub of a check drawn to the Coal Company for $675, and the bookkeeper found the $675 paid check endorsed by the Coal Company.

"Well, perhaps it was included in that check, along with some grain or lumber," said Johnson. "The Coal Company certainly got $675 of our money, but the check doesn't tell us what for."

More vexatious hunting and loss of temper. Eventually the $675 invoice came to light disclosing the fact that the $110 coal bill had been paid.

Johnson called up the coal people and vented some of his bad temper on them. They were very sorry. "It was an error of one of our clerks. It won't happen again, we feel sure. These things occur, you know, in even the best business houses," they said.

• • •

Are these things occurring in *your* business? Many a bill *has* been paid a second time through lack of a system.

Do away with such possibilities. Do away with losses of time, losses of temper and vexatious file hunting for lost or mislaid receipts. Use Hall Voucher Checks. They earn big dividends on a small investment. They enable you to pay your bills in a systematic, mistake-eliminating manner. If Johnson had used the above check there would have been no loss of time. To-day he pays all bills with the Hall Voucher Check.

Look at the check—study the statement form. Note the items under the heading, "By Endorsement this Check Is Accepted in Full Payment of the Following Account." The amount of each one of the number of items, included in the total for which the check is drawn is tabulated on a line by itself. Against each itemized amount you can set down what it is for—coal, grain, lumber, etc.

Below is the total of the invoices and beneath it the discounts and freight deductions and their total, which, subtracted from the total of the invoices, shows how the amount of the check is obtained.

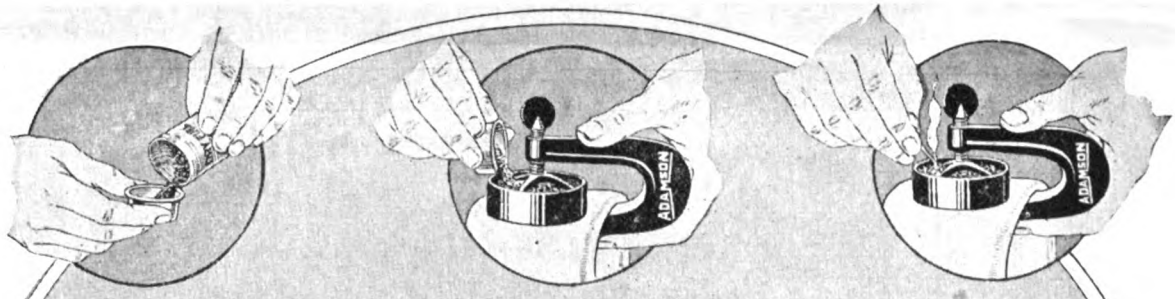
A perfect record and a simple one. See how it protects you on your personal, or business bills—doing away with all follow-up on bills, checking of bills and filing of receipted bills against the day of a disputed payment—the simplest bill-paying-receipting-and-filing system it is possible to get.

• • •

The Hall Voucher Check was devised by a concern that has been the leading manufacturer of bark checks for forty years. It was designed to do away with money losses, time losses and with a lot of useless bookkeeping and filing that in the end does not prevent losses.

The Hall Voucher Check is an always-at-hand indisputable receipt—an itemized, positive evidence of payment.

These checks are made in standard form—3¼ inches by 8⅓ inches; stub 5½ inches long; six colors of selected bond paper—White, Buff, Blue, Green, Gray and Russett; or three colors of National Safety Paper—Pink, Blue and Primrose. Books of 500 checks, perforated and numbered in red ink, 3 to page, imitation leather backs, flat stitched. Sample book to business firms upon request. We have other forms than the one shown here.



In order to introduce these checks more thoroughly, the manufacturers are now making the following special introductory prices, with delivery charges paid if remittance accompanies the order:

		Bond	Safety
500	Checks	$ 4.50	$ 5.00
1000	"	7.00	8.00
2000	"	13.00	15.00
3000	"	18.00	21.00
5000	"	25.00	30.00

These prices are for printing in black ink. For bank name in red ink add 50 cents for each book of 500 checks.

Test the time and money-saving efficiency of these checks. Do away with losses and uncertainty about payments. Note again the small cost of the checks and mail your order to-day, writing very legibly the name and address of the concern or the individual name to appear on the check, and the correct bank title, the printing to appear over and under signature line and first number to be used. Remit P. O. Money Order or Draft on New York or Boston, if you have no commercial rating. We know that these checks will prove valuable to you.—THE J. C. HALL COMPANY, 71 West Exchange St., Providence, R. I. Bank Stationers for 40 years. Ask any bank about us. No Agents Wanted.

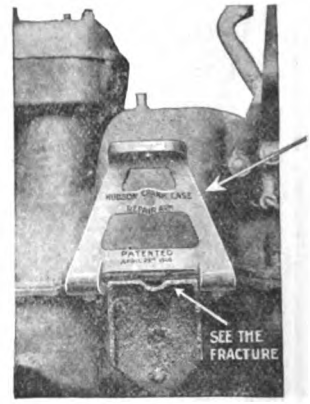
HUDSON

CRANK CASE REPAIR ARM

$1.50 F. O. B. Philadelphia

HUDSON Crank Case Repair Arms are as necessary to garagemen, repairmen and Ford owners as watches are to railroad men. To repair broken Ford crank cases the slow old way is like telling time by the sun—It's inconvenient and more complicated.

The photographs tell the Hudson story. They tell how time, money and labor are saved by the use of this repair device.



It is not necessary to take the engine out of the chassis—it's just a matter of unloosening three bolts, slipping the Hudson Arm into place and tightening them up again to make a perfect repair—requiring less than a half hour to do a half day's job.

Every repairman should have Hudson Repair Arms for making crank case repairs and a stock to sell Ford owners. Get them from your jobber—if his name is not listed, write us direct.

Jobbers: Here's a rapid and a profitable seller. It is one that you can sell to practically all your customers. Write us at once for discounts.

It is patented—
beware of infringers

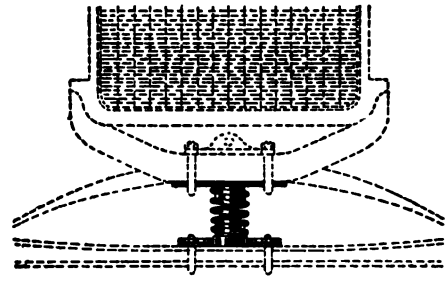
PLUNKETT SHOCK ABSORBERS

"A Shock Absorber and Rebound Snubber in One"

It doesn't pay to run the risk of being without one—no man knows just when he's going to meet that bad spot in the road—or just when his Ford is going to have extra weight to carry.

The Plunkett Shock Absorber will preserve the springs of the automobile indefinitely regardless of extra weight or rough usage. It not only absorbs the shock before it reaches the springs, but serves as a support for the central portion of the springs where the main strain is applied. In addition to these features it does not detract from the appearance of the automobile.



Price, $6.50 each complete

On receipt of check or money order, will ship prepaid to any part of the United States.

Listen to the motor *sing*

The song of the motor will tell you in a moment that Hi-Comp Piston Rings are perfectly *gas-tight*. That *different* tune they make the motor sing proves the motor has been given NEW life, NEW power, NEW efficiency.

HI-COMP PISTON RING
THE RING THAT MAKES THE MOTOR SING

deliver every ounce of power from every drop of gasoline *on* the piston head—where it belongs. None of that power can get *past* the rings, because the Hi-Comp scientific principle and perfect mechanical construction make each ring remain a *gas-tight seal* under all conditions—racing or creeping along or *gliding* up hills. This *gas-tightness* overcomes carbon troubles which are due to oil getting past the rings into the explosion chamber where it *burns*. Hi-Comps end knocking, skipping and faulty ignition; pitting of valves and valve seats; and are *guaranteed* to give *MORE POWER* on much less gasoline and oil.

Made by an old established piston ring company from 2 perfectly balanced eccentric rings into one perfect concentric ring that will not wear cylinder out of round – *proof* of gas-tightness. Each ring ground and polished *under oil* to preserve true temper of secret process grey iron and finally tested by micrometer examination. Make reboring of average cylinders unnecessary—proof of perfect expansion.

Write for booklet, specification chart and details of liberal 90-day guarantee trial. It will pay you to install Hi-Comps because they give *satisfaction*.

GET INTO THE Tire Repair Business

Tire Repairing is the most profitable branch of the rubber business, and it requires but a very small capital. There are over seven million tires in use at the present time, and all of them must be repaired. Get into the business and get your share, but start right. Equip your shop with O'Neil Vulcanizers, the vulcanizers that have stood the test for over ten years and are used and recommended by tire manufacturers and the majority of tire repair concerns. Send for our catalogue.

IMPORTANT POINTS ABOUT PAINT AND VARNISH BRUSHES

A Set of Three Brushes and the Automobile Dealer and Repairer for One Year for $2.00

Brushes Needed in Repainting and Varnishing an Automobile.

Did it ever occur to you that there was much difference between a good paint or varnish brush and a poor one? Probably not. To most people a brush is just a brush. Yet an analysis shows that there is an almost measureless difference between a good brush and poor one.

For instance, a properly made Flowing Fitch brush is hermetically sealed, so as to keep the paint, or whatever may be used, from getting into the brush at the top and loosening the hairs. All such properly made brushes are solidly set in glue cement inside a leak-proof ferrule, and a whole row of neatly clinched nails are driven in at the end of the ferrule to give added security, and a guarantee that the hairs will not pull out.

A Fitch brush is *smooth, soft,* and *flowing,* and does not "mush" up or get flabby like a cheap brush, but holds its springiness. The trouble with cheap brushes is that the ferrule is nothing more than a single band of tin, open at the top, with a couple of nails jabbed through. When you use such a brush the cheap hair will pull out and scatter all over your work, because it is not held in securely enough to stand the drag of the brush in painting or varnishing.

A brush may be washed with gasoline or kerosene oil, but to clean it thoroughly turpentine should be used. No brush used for painting should be used for varnishing.

We have recently made arrangements with one of the best manufacturers of these properly made brushes in New York to offer a set of Three in connection with a subscription to the AUTOMOBILE DEALER AND REPAIRER for a year for **an even $2.00.** These brushes sell at retail for **$1.40.** It will be seen, therefore, that there is a substantial advantage in sending to us for the AUTOMOBILE DEALER AND REPAIRER for a year, and for a set of these brushes.

Present subscribers can have their subscriptions extended for a year, and secure a set of brushes, on the same terms. These brushes are guaranteed in every respect, and though they cost more than cheap brushes would cost, they are far cheaper in the end, because of their lasting qualities and the good work that can be done with them. No man can afford to waste expensive paint and varnish on an automobile by using a cheap and poorly constructed brush, such as is usually to be found wherever brushes are sold. The ordinary dealer in brushes himself as a rule has very little knowledge of the quality of the brushes he sells.

Remit by check or money-order, and your name will be entered as a subscriber to the AUTOMOBILE DEALER AND REPAIRER for a year, and a set of these brushes, which are just the right size and shape (see illustration, which is exactly one-half the actual size of the brushes,) will be sent to you, postage prepaid.

THAT RUSTY MOHAIR TOP

WILL LOOK LIKE NEW
IF YOU TREAT IT TO ONE COAT OF
FRANK MILLER'S MOHAIR TOP DRESSING.

Facts About Mohair Tops
Which Every Motorist Should Know

MOHAIR CLOTH depends for its waterproof qualities *only* upon a thin sheet of rubber composition inserted between the two layers of cloth.

ONCE THIS RUBBER INSERT BECOMES POROUS, THE TOP IS GONE.

MORE MOHAIR TOPS ARE RUINED by the use of injurious dressings than ever wear out naturally

THIS IS BECAUSE nearly all the top dressings on the market contain some substance such as Alcohol, Turpentine, Benzine, Gasoline or oils which will attack rubber.

THESE SUBSTANCES slowly eat into the rubber insert and destroy its elasticity.

WHEN THE TOP IS LOWERED, the rubber insert cracks along the folds, making small holes through which the water enters.

IT MAY TAKE A MONTH or more to spoil a top in this way, for the action of these substances is sometimes slow and the damage is not visible, but

WHY SPOIL THE TOP AT ALL
WHEN YOU CAN GET A DRESSING WHICH WILL *NOT* HARM IT
FRANK MILLER'S MOHAIR TOP DRESSING

Is specially prepared to be absolutely non-corrosive. It is different from all others. It contains no harmful ingredients.
It will impart a wonderful silky sheen with ONE COAT—AND THE FINISH LASTS.
It is carefully made by a manufacturer whose reputation for Quality Products has been of the highest for more than EIGHTY YEARS.

THIS IS A DRESSING—IT IS NOT INTENDED TO MAKE A LEAKY TOP WATERPROOF. Attempts to fill up the holes in a porous rubber insert with some kind of waterproofing compound seldom gives the expected results Not only do dressings containing such compounds spoil the natural grain finish of the fabric, but the waterproof qualities obtained by this method do not usually survive one folding of the top.

DO NOT ACCEPT SUBSTITUTES. Your dealer can easily get you Frank Miller's if you insist upon having this harmless dressing. If he will not, write us direct and we will see that you are promptly supplied.

EKERN'S
PORTABLE GREASE GUN

keeps your grease off the floor and prevents waste. Registers the exact amount of grease sold to a customer—save their cost in a very short time. Handy—portable—can be moved to any part of the shop. Refilled in a minute. Holds 20 pounds of grease or 2½ gallons of oil.

List Price, Model K

$47.50

We would not be so foolish as to declare that a man cannot be successful, up to a certain point, without Ekern's Portable Grease Gun. He may walk to the top of a 20-story building by taking the stairs, but the modern business man—the big successful one today—is the man who takes the elevator.

PROTEX GAUGE
Is an Infringement of
MARTIN GAUGE COMPANY'S PATENT No. 1,220,272

On April 24, 1918, Judge A. L. Sanborn, of the United States District Court in Chicago, handed down a decision in our suit against the Protex Manufacturing Company, Charles Friedlander & Co. and Albert E. Pollock, holding that the Protex gauge is an infringement of all of the claims of our patent No. 1,220,272, awarding us an injunction against all of these concerns and individuals, and an accounting of profits and damages with costs.

This was notwithstanding the fact that the Protex Company has had a patent issued first.

We wish to warn the trade against handling the Protex gauge, as any one so doing is liable for an action for infringement.

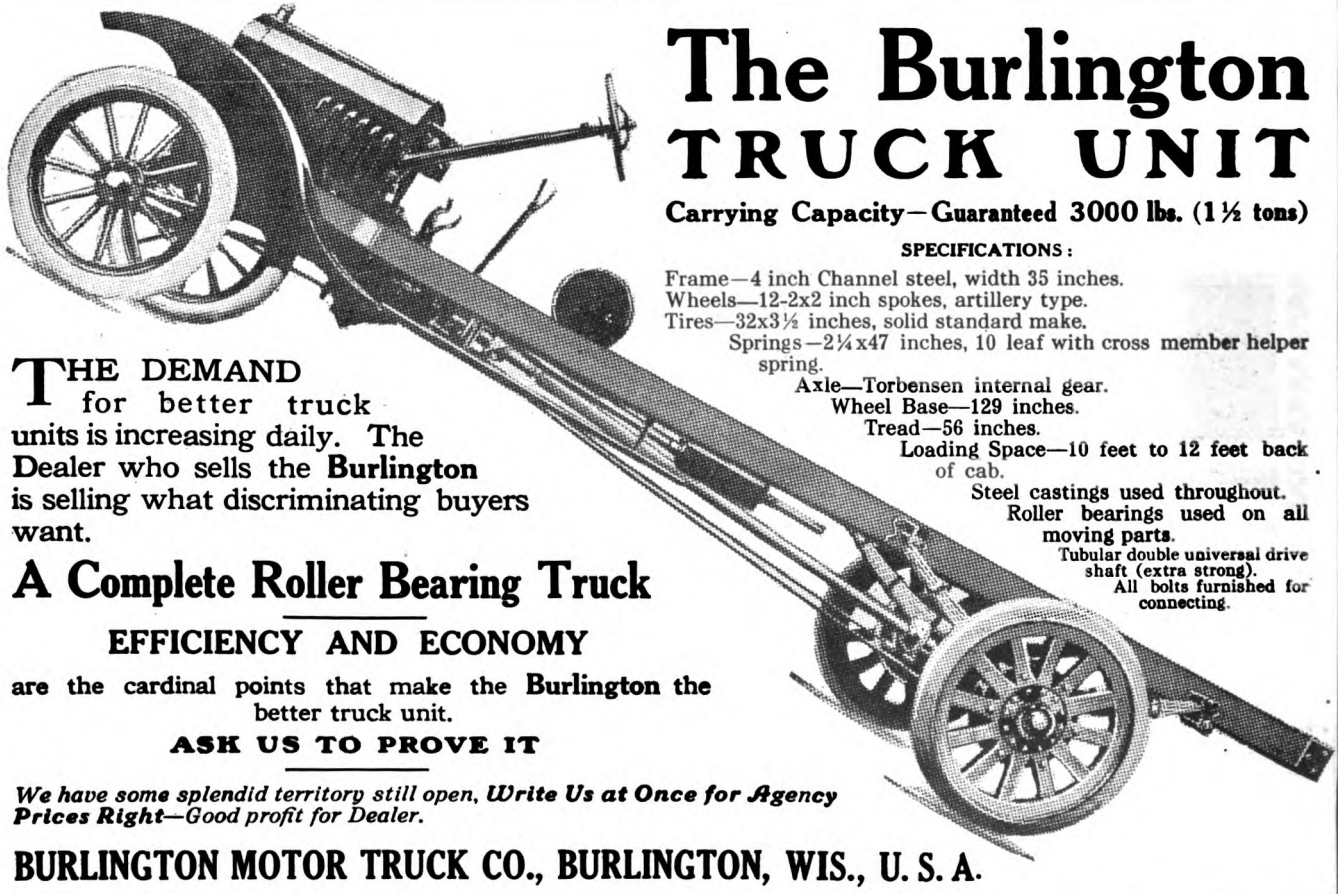
PECK'S SUPER HEAT MANIFOLDS

Are Doing Their Bit

Enable Your Car to Meet War Time Requirements of Economy and Fuel Conservation.

Some of the things that PECK'S Super Heat Manifolds are guaranteed to do:

West of Rocky Mountains, $8.50



If your car is not equipped with a PECK'S Super Heat Manifold, order one today. It is guaranteed to give you from 40 to 60% more miles per gallon, with the same efficiency that could be obtained with high-test gasoline.

Cut fuel costs; increase mileage; eliminate carbon; give more flexibility, greater power; stop over-heat of motor; prevent fouled spark plugs; save trouble and satisfy owners.

With the increased cost of gasoline and with the poor quality, it is necessary to use some means that will vaporize the fuel, so the highest efficiency may be obtained. PECK'S Super Heat is the way.

If Your Dealer Can Not Furnish You, Write to Us Direct.
Dealers and Jobbers Wanted. Liberal Commissions. Write.

EASILY CARRIED ABOUT
LIKE A SATCHEL

Finely built and scientifically designed, this little Electric Air Compressor is fully as quick and powerful as many pumps four times as large.

BLACK & DECKER

LECTROFLATER
ELECTRIC AIR COMPRESSORS
No. 2 Hand Size

Just suits the needs of small garages, tire and accessory stores, repair shops, etc.

This sturdy little machine is the most powerful Air Compressor, for the size, that has ever been put on the market.

Requires no attention. All working parts self-contained in a single housing and very compact; can be mounted out of the way on a wall or carried about like a satchel.

Scientifically air cooled by forced draught—no water to freeze in Winter. Automatically grease (not oil) lubricated—no oil spray to ruin tires.

Extremely economical. Costs about the same to operate as an electric fan.

Uses either alternating or direct current from any electric light socket.

Shipped completely equipped, ready to work. Outfit includes quick acting coupling and accurate pressure gauge. Price **$90.00**

Write today for descriptive literature of the Lectroflater line. Many types, sizes and combinations to select from, at prices to fit most any pocketbook. Jobbers: Write for sales proposition.

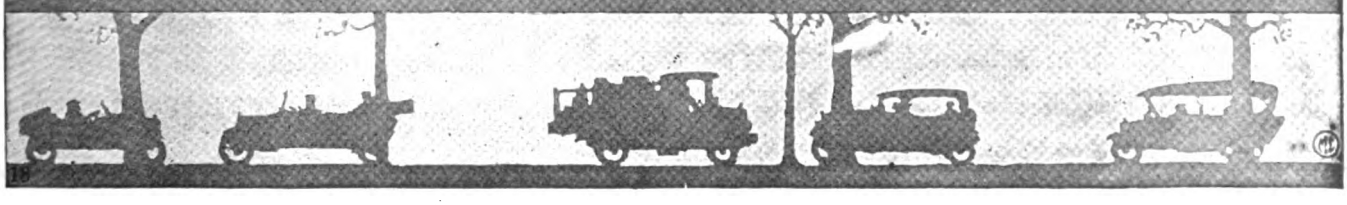
For "Every Other Car"



Here is a complete Automobile Screw Plate for Ford cars, consisting of Taps, Dies, Reamers, Stocks, Tap Wrenches fitted for the requirements of the Ford. It is called a Garage Repair Set, but is equally valuable to the dealer and car owner—in fact everyone who has occasion to care for a Ford car can use and needs this set. It is furnished in a well-made wooden box, handy for general use and to carry on the road to repair jobs.

As Ford led in standardized production of automobiles, so has G. T. D. led in the standardization of screw threads. This set consists of selected G. T. D. products to fit the Ford requirements. It is a sound investment, as proven by the large numbers sold and in use.

On sale by the best dealers—write us for particulars and booklet of Auto Tools.

SAVE 60% WHEN YOU RUN YOUR FORD

Use Kerosene

DRIVE YOUR CAR TWICE AS FAR AND BUY YOUR FUEL FOR LESS THAN HALF.

OFFICIAL TEST
DETROIT AUTOMOBILE CLUB
June 4, 1918

UNDER instruction of Mr. W. S. Gilbreath, manager of the Club, I acted as observer of a test run made with your Kerosene Equipment on June 3rd.

The equipment in question was attached to a 1914 Model T Ford, which was not in the best mechanical condition at the time.

One and one-fourth gallons of Kerosene were consumed in the test, a distance of 37 7-10 miles being traversed, much of this on ordinary country roads. About eighteen miles of the trip was through fairly heavy traffic. A speed of 22 miles per hour was maintained.

Performance of the car was equal to, if not better than could have been done on other types of fuel.

DETROIT AUTOMOBILE CLUB,
E. W. SULLIVAN, Observer

POWER

FROM PISTON RINGS

Good oil engineers have found that 80% of the excess oil and unburned gases pass around and behind reciprocating piston rings. The result is lost power and excessive carbon.

PRESSURE PROOF PISTON RINGS

cannot reciprocate The spring expander automatically takes up any excess in the ring groove. All possibility of either oil or gases passing between the cylinder walls and the piston is overcome. This is why Pressure Proof Piston Rings permanently eliminate carbon and restore maximum power.

Write for "New Facts About Piston Rings" and special dealer proposition

$3.82 SEVENTH EDITION $3.82
DYKE'S AUTOMOBILE ENCYCLOPEDIA

Entirely re-written, hundreds of illustrations and many new subjects added. Practically a new book. A non-technical treatise with simplified illustrations on Constructions, Operation, Repairs and Adjustments, Cares and Troubles of the Automobile.

There are 50 Instructions—Simplified and practical.

3500 Illustrations—the kind you understand at a glance.

3 Supplements, parts printed in colors, treating on the construction, operation, repairing and adjusting of the **FORD** and **PACKARD**—tells how to make a Ford do 60 miles per hour; how to get more mileage per gallon; how to convert into a truck, racer, fine point adjustments, etc. **Airplane Supplement.**

775 illustrations and 279 pages on Electric Ignition, Electric Starters and Generators, etc.

51 pages and 254 illustrations on Adjustments, Tests, etc., of leading **Electric Systems.**

154 pages and 1189 illustrations on Repairing. Oxy-Acetylene welding, and subjects as **Repairs on all types of Axles, Differentials, Steering Devices thoroughly covered—as well as all parts of the Engine.**

27 pages and 180 illustrations on Tires and Tire Repairing.

44 pages and 119 illustrations on Carburetion.

89 pages and 291 illustrations on Engine and Parts.

16 pages on Digest of Troubles.

6000 lines to the Index. This is a feature worth noticing, as it means a ready reference on everything pertaining to motoring. Index begins on colored paper, easy to refer to.

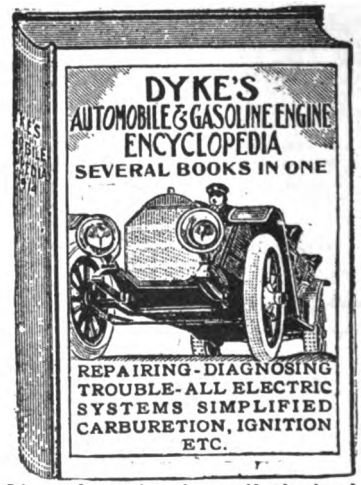
Dictionary is also included, which gives the meaning of motoring terms.

Inserts: There are five—printed in colors. New features you never before saw or heard of in one of the inserts.

NEW ADDITIONS
TRUCKS, TRACTORS, MOTORCYCLES, AIRPLANES AND AIRPLANE ENGINES.

Price $3.82, Prepaid, Express.

How to Become an Expert Automobile Mechanician



The quickest and cheapest, but BEST way, is by studying Dyke's Automobile and Gasoline Engine Encyclopedia.

It is a practical, simplified instruction on everything you want to know and OUGHT to know about motoring.

First you learn the principle of construction of each and every part of a car and engine—then the variance of construction—then the adjustments and repairs.

You learn how to diagnose troubles in a scientific manner. Step by step you advance until you are a *real expert* on timing the valves and ignition, repairing and adjusting. You learn the carburetion subject so thoroughly, you can adjust any make.

You will like this book, in fact we will guarantee you would not sell it for three times its cost if you could not get another.

It's worth ten times its cost if only placed on the shelf and used as a reference.

You will also understand Aviation, Truck and Tractor Engines as well as Auto Engines when you complete this book.

Beware of Imitators—this is the *original, simplified* book on REPAIRING, ELECTRICAL SYSTEMS, TROUBLES, Etc. It is the only book in the world combining all these subjects under one cover. Why get three—or four books?

Mr. Dyke published the first practical Automobile Book in America.

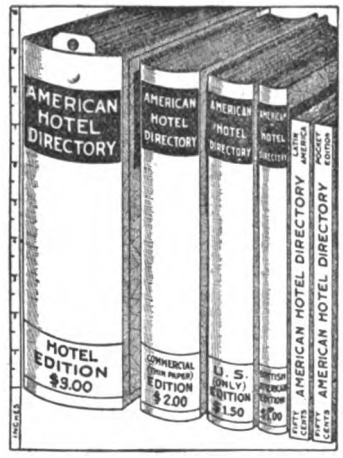
AMERICAN ACCESSORIES CO., Sta. A. D., Cincinnati, O.



CLEAN YOUR ENGINE REGULARLY WITH A

One qt. kerosene and 6 lbs. air pressure cleans all dirt, grit and grease from engine. Prevents wear, actually saves half the usual repairs. Quick, economical, thorough, easy and cleanly to operate. Necessity for repair shops.

Wagner Specialty Co., 1902 Broadway, New York City

THIS YEAR'S AMERICAN HOTEL DIRECTORY

YOU CANNOT ASK US A QUESTION ABOUT ANY CITY AND HOTEL OF THE WESTERN HEMISPHERE THAT WE CANNOT INSTANTLY ANSWER. WE WANT TO ASSIST YOU IN PLANNING YOUR ITINERARY OR ROUTING YOUR TRAVELING REPRESENTATIVES. LET ONE OF US BE YOUR PRIVATE BUREAU OF INFORMATION.

HOTEL EDITION, $3.00—That's the big brother, he knows as much as all the rest of the family put together. He is built for heavy work and rough usage at big hotels. He's informed on everything but the time table" on North and South America, from Bermuda to Hawaii inclusive.

COMMERCIAL EDITION, $2.00—Knows just as much as his big brother, but not so strong, designed for smaller hotels and commercial offices, where he won't have to work so hard, still, with reasonable, careful use, he's long lived.

UNITED STATES EDITION, $1.50—A fine investment for any one who doesn't go outside of the United States, but when it is within these borders, you can't stump him with a reasonable question.

BRITISH AMERICAN EDITION, $1.00—This chap has completed a tour of all Canada, and the British American Islands, he knows all about these parts and the hotels.

LATIN-AMERICAN EDITION, 50c.—A little fellow to be sure, but still full of information about everywhere and everything fit for a white traveler to go or see in the Southland—from El Paso to Cape Horn.

POCKET EDITION, 50c.—The little book with the big circulation, designed for the traveler and his hand bag or coat pocket. Lists the principal cities, principal hotels, and points of interest in United States and Canada only.

All illustrated, printed on strong paper and cloth bound.

Either of the editions referred to above will be sent to any address on receipt of price. We would particularly recommend the **Pocket Edition at 50 cents**, as it will answer for the most part all practical purposes. Postage stamps accepted in payment. Address:

MOTOR VEHICLE PUBLISHING CO., 71-73 Murray Street, New York.

THE RED ROAD BOOK

288 Pages. Price, $2.00

—and—

THE AUTOMOBILE DEALER AND REPAIRER

$1.00 a Year

BOTH FOR $2.00

A great many of our subscribers will be glad to know that we have made arrangements with the Bullard Co., of Boston, publishers of the "RED ROAD BOOK," on such favorable terms that we can offer this admirably arranged book, size 9¾ x 9¾, and comprising 250 pages, in connection with the Automobile Dealer and Repairer for a year, for $2.00, which is the regular retail price of the book.

In other words, by subscribing to the AUTOMOBILE DEALER AND REPAIRER, the subscription rate of which is $1.00 a year, you get the "RED ROAD BOOK" AT HALF PRICE.

We don't know of any better book than this on the market. It is bound in flexible cloth, and comprises road maps of the following states:

All of the New England States	Pennsylvania	Virginia
New York	Maryland	West Virginia
New Jersey	Delaware	District of Columbia
North Carolina	South Carolina	Georgia	Florida

These states are largely patronized in the Summer by tourists from all over the country, who like to visit the Catskills, the Adirondacks, and the White Mountains. The "RED ROAD BOOK" also gives maps of that portion of Canada reached by routes from Northern New York, Northern New England and Northern Maine.

It further gives 203 city street maps, to which are added road distance tables, ferry tables, and the necessary population and location indices for all towns.

Reading route matter in connection with the principal routes is tersely told, and will be printed in black, and their reverse routes printed in red, to avoid confusion.

The aim in the production of this work is simplicity. Too many automobile route publications attempt so much, that in their efforts to be "complete" they become "confusing." The publishers of this work say that many years of motor travel and the observations of others lead them to the opinion that once out of the confusion of a city's streets, on the broad highway, the need is less for the detailed, must-be-closely followed printed words, comments and instructions of the path itself, but rather the need is for the accurate knowledge that the road to town A and thence to town B is of "automobile goodness," and that it proceeds via this and that village, this or that side of a lake or a mountain, with crossing railroads, or paralleling trolley lines, as a check on location.

Thus is one free to carry out his original purpose; namely, to see the country, with this instruction book.

If with such maps as are shown in this road book, one sees that they are to pass within a few miles of a well-known and picturesque lake, or historic hamlet, or perhaps desire to go "across country," a good road map is the best aid for this free lance mode of travel.

A new edition of this road book is now being prepared, and will be corrected right down to date, and will contain much new material. The book will be ready for delivery from the first to the fifteenth of May.

All orders sent to us will have prompt attention just as soon as the book is issued. In case you have already renewed your subscription, a Red Road Book will be sent on receipt of One Dollar. Address:

Bespeaking Patience

It has become necessary to advise prospective purchasers of the Weston Model 280 Garage Testing Instrument that deliveries can no longer be made promptly. Under present war conditions, there are unusual requirements which must receive our consideration in advance of commercial orders.

For this reason, we can accept your order only on the basis of delivery when possible. We suggest that you place it as early as you can.

Appreciating fully the needs of our customers and that the radical superiority of the Weston Model 280 Garage Testing Instrument is now well known to the Garage and Service Station men, we promise to execute orders in the order of their receipt and as quickly as conditions will permit.

We are confident that this frank explanation of the situation will be accepted by prospective purchasers in the co-operative spirit in which it is submitted.

"ENLISTED FOR THE DURATION"

(*Being a Little Talk to the Trade*)

THE DECARBONIZER automatically supplies to the gasoline, at the point where it is vaporized, the exact amount of moisture which the vapor requires to insure the greatest expansion when it is ignited in the cylinder.

This moisture is automatically drawn from the half-gallon reservoir of water stationed beside the engine and serves not only to aid the gasoline in producing power, but also positively and very quickly removes what carbon may have accumulated on spark plugs, cylinders, pistons and piston rings, and absolutely prevents its recurrence.

THE VAPORIZER. In this department the Gas-E-Co System overcomes certain disadvantages which the Ford owner encounters today because only a low quality of gasoline is obtainable and the carburetor on the Ford car is only capable of high efficiency with a high grade of gasoline. The Vaporizer in the Gas-E-Co System adjusts itself to the speed of the engine, with the result that the gasoline is completely vaporized and combustion takes place the instant it reaches the cylinder. This produces the same degree of power that the engine used to develop when gasoline was good.

THE AUTOMATIC NEEDLE VALVE CONTROL connects the gas lever on the steering wheel with the needle valve at the carburetor, and controls it. It supplies the greatest amount of air and the least amount of gasoline to meet every condition of operation. Thus it limits the consumption of gasoline to the actual needs of the engine at all times, and prevents the waste of gasoline so frequently caused when the needle valve is fixed.

Where the Gas E-Co System is installed it is fair to say that the engine selects its own mixture. Every movement of the throttle lever on the steering wheel adjusts the mixture and insures a minimum use of gasoline which costs money, and a maximum use of air which costs nothing.

WHEN a soldier "enlists for the duration" it means he's going to stick throughout the war.

The same is true when an improvement "enlists for the duration" in the army of automobile accessories.

The soldier is fully aware of the dangers and difficulties to be encountered, but because he knows he is right he makes up his mind that he will see it through—that he will "stick."

The same is true with the producers of an improvement in the automobile industry. They know the dangers and difficulties to be encountered. They know how many have gone down to defeat. But when they KNOW THEY ARE RIGHT, they enlist "for the duration." They are going to stick!

The Gas-E-Co System for Ford Cars Is "Enlisted for the Duration."

It totally eliminates carbon. It automatically regulates the supply of gas to the needs of the engine. It thoroughly vaporizes the mixture. It makes a Ford car run at all times as it now does on a warm, moist evening. It makes a Ford a SUPER-FORD.

The Gas-E-Co System is good on its merits. Add to that the intensive sales and advertising co-operation that we render to dealers and the proposition is a splendid one.

The retail price of the Gas-E-Co system is $10. If your jobber has not yet stocked we will see that you are supplied.

The country needs the Gas-E-Co System and the Gas-E-Co System is enlisted "for the duration."

Dealers who will do their bit will get theirs, so write for the proposition, for the proposition is right.

The MUNGER "Always Tight" expansion joint

MUNGER "Always Tight" Piston Rings

The upper groove of a piston always becomes worn before the other grooves are affected, so that a piston ring of regular size will not fit snugly. To meet that condition, each complete outfit of Munger "Always Tight" Piston Rings includes one *overwidth* ring for each piston and a Re-grooving Tool. With this tool the car owner or garage man can straighten-up a worn groove so an overwidth ring will fit true and properly.

Munger "Always Tight" Piston Rings conform to the shape of the cylinder and the Expansion Joint keeps them gas-tight until worn out.

SHALER

BENCH TYPE
STEAM TUBE VULCANIZER

Type "L-40"
Price $35.00
(Subject to Trade Discount)

Heated by Gas or Gasoline

Will Pay for Itself in a Week

This SHALER Tube Vulcanizer is the most popular vulcanizer ever put on the market. Thousands of them are in use in Garages and Repair Shops, and many of them have more than paid for themselves the *very first day* they were used!

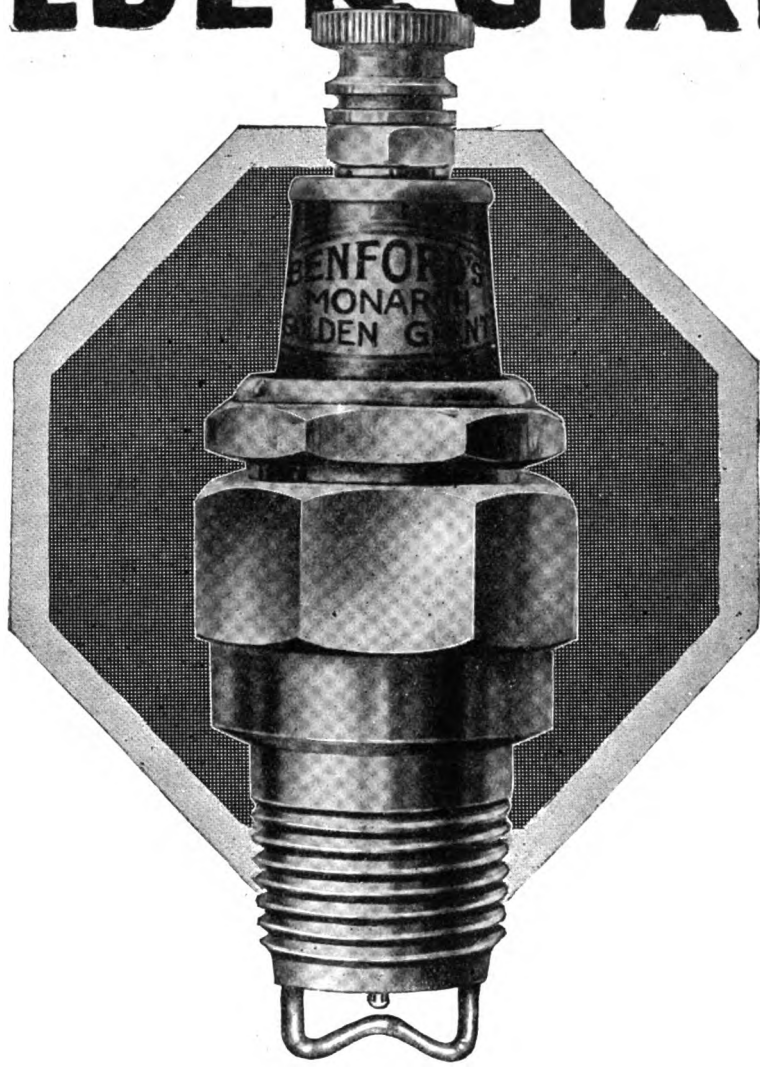
You can do every kind of tube repairing with this vulcanizer, just as well as with the most expensive machines costing many times as much.

It repairs four tubes *at one time*—and vulcanizes perfectly any size or shape of puncture or cut up to two feet in length. There is no vulcanizer made that will turn out better work or do it more quickly—why think of paying a big price for a vulcanizer that will do no more than this practical SHALER Tube Vulcanizer!

Easy to Operate—Automatic Heat Control—SAFE!

Even a boy can make perfect repairs with this vulcanizer. You don't need experience. Your ordinary garage help can repair any size or kind of inner tube—and make a perfect job of it.

The SHALER Vulcanizer is the only one that has automatic heat control. Requires no watching or regulating, yet there is no danger of overheating tubes or undercuring the rubber. Takes up very little room in your garage or repair shop—it can be placed on any work bench and moved about at will. This vulcanizer uses little fuel—is furnished with either gas or gasoline burner—or both can be had if desired.



All Jobbers Sell This Popular Outfit

Ask your jobber now for complete information about SHALER Bench Tube Vulcanizers—or send to us for the new SHALER Catalog of Shop Vulcanizers. Investigate—but do it NOW!

BENFORD'S GOLDEN GIANT

FINISH

The Refinement of Quality

A BEAUTIFUL picture is framed beautifully. A car that is an engineering triumph naturally is crowned by a fine body.

Uncle Sam's battlers on land and sea are splendid in their trig, smart uniforms. We dress them that way to show our pride in them.

At the race tracks the sleek thoroughbreds with their painted hoofs show the owners' appreciation of nature's finest work.

Appropriate, all these—are they not?

Appropriate, in exactly the same degree, the coat of pure gold for the Golden Giant.

The Finest Spark Plug Made

That Product of Yours

is all O. K., but if you ever expect to make a REGULAR business out of it—that product will require the "tonic" of advertising, as no permanent foundation can be obtained without it.

The day of placer mining is over—one digs for his gold nowadays.

Dig With a Full Page Advertisement IN THE CHICAGO SHOW NUMBER OF THE Automobile Dealer and Repairer

This number comes out about the middle of August — beforehand enough to do you a world of good in connection with **The Truck, Tractor and Accessories Exposition,** to be held Sept. 14th to 21st, inclusive, 1918, at the five million dollar Municipal Pier, Chicago.

MUNICIPAL PIER, CHICAGO

If we can hear from you as soon as you read this—

OUR "PUT IT OVER" DEPARTMENT

will prepare special copy for you.

In this department we create advertising ideas, draw pictures, border designs and lay-outs which attract the reader's attention—holding, at the same time, the proper commercial value.

We write advertising that will boost your product—bring it from obscurity and, through our medium, put it into the markets of the world.

If you're going to dig—dig with a full page ad—in the August Chicago Show Number

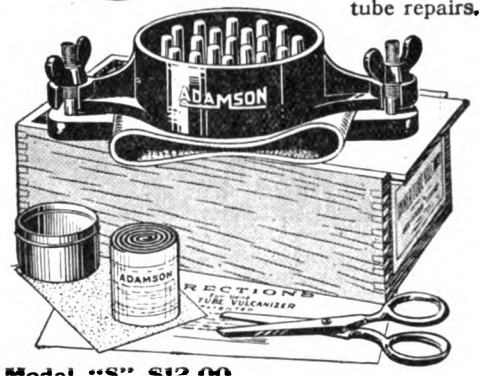
Make Economy Pay YOU Profit!

Model "U"
$2.00
Repairs tubes and casings; mends tread cuts and saves the tires.

Model "E" $1.00
Repairs tube punctures in five minutes. Uses Adamson Dry Fuel or gasoline.

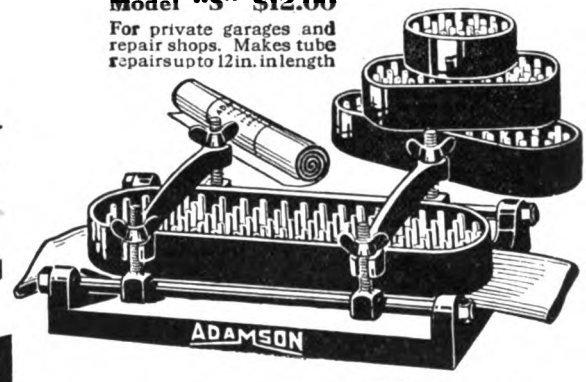


Model "T" $1.50
For all inner tube repairs.

Every motorist is seeking a way to make his casings and tubes last longer, and protect himself against the rising costs and threatened shortage of new tires.

Adamsons best meet this increasing demand because they not only mend *tubes,* but vulcanize cuts and abrasions in the *casings,* and keep moisture and dirt from getting into the fabric and destroying the tire. That means thousands of miles more tire service at the cost of a few cents.

Profit by this opportunity. Display and sell the Adamson line—a vulcanizer for every repair a motorist can make; surest in results and cheapest to buy and use; all models burn common gasoline, the fuel that is always dependable and easy to get.



Model "S" $12.00
For private garages and repair shops. Makes tube repairs up to 12 in. in length

Write for Store Displays and Dealer Helps.

Cool driving!

Shurnuff TRADE MARK REG. U.S. PAT. OFF. WINDSHIELD VENTILATOR

Are You Handling This Fast-Selling Ford Fixture?

You don't have to be told how hot it gets in the front part of a Ford in Summer and how much every Ford owner wishes he could open the windshield from the bottom and bring the breezes down to his feet and legs. Now you can "cash-in" on that situation.

In the *Shurnuff* Ventilator Windshield you can offer Ford owners all the ventilating and rain and dust-tight features that are given by the windshields of high priced cars. It consists of two black enameled uprights so shaped as to make the sides of the windshield rain-proof. A metal and rubber strip fastens to the cowl and makes it rain-proof at the bottom also. Metal handle supplied for lower sash so that it can be pulled backward. Also four small corner plates for reinforcing.

Can be installed in 30 minutes.
The Ford owner can do the work.

Each ventilator set is packed in a labeled carton and makes a good showing on the shelf. Six sets are packed in a dealer's case. Price retail, per set complete $7.50, $7.75 west of Rockies, $11.25 in Canada. Order a half dozen cases from your jobber today—you can quickly sell that number, and six Ford owners in your section enjoying cool driving will bring in more buyers right along.

Dealers: *Shurnuff*
Necessities for Ford cars are sure-enough fast sellers. All guaranteed. All packed in attractive cartons for self display. Carried by jobbers everywhere. Write for literature.

Shurnuff Mfg. Co.
Dept. D, St. Louis, Mo.
Sales Dept.,
Zinke Co., Chicago, Ill.

Shurnuff Running Board Fender Support stops sagging of running board, eliminates excessive vibration of front fender, reduces shocks and stabilizes the car. Needed on all Fords. Saves battery from damaging vibration.

Price, per pair	$4.50
West of Rockies	4.75
In Canada	6.75

Shurnuff Grease Retainers. Grease leaking from rear axle of Fords rots the tires, causes brakes to lose their efficiency and makes a dust-collecting mess on wheels, brake and axle housing. The *Shurnuff* EFFECTIVELY stops these grease leaks.

Price, per pair	$0.90
In Canada	1.35

Shurnuff Combination Manifold combines intake and exhaust so that heat from latter dries incoming gasoline and vaporizes it perfectly. Result: smoother running, more power, more miles per gallon, less carbon.

Price	$9.00
West of Rockies	10.00
In Canada	12.50
